Energy Research Abstracts

Abstracts 19398-22897

Technical Information Center
UNITED STATES DEPARTMENT OF ENERGY

CURRENT AWARENESS PUBLICATIONS ON ENERGY

To provide complete coverage of literature related to major Department programs, announcement publications that are comprehensive in their coverage of certain energy fields are issued regularly. All information in these publications, plus additional backup information, is included in the Energy Data Base of the Technical Information Center; all references are also available for machine searching via the on-line retrieval system, DOE/RECON, and the commercial on-line retrieval systems. Descriptions of these current awareness publications, which are supported either directly or indirectly by the DOE, appear below. Department of Energy components may receive the listed publications free from the Technical Information Center, P.O. Box 62, Oak Ridge, TN 37830. Telephone (615) 576-1303; (FTS) 626-1303.

PUBLICATIONS OF THE TECHNICAL INFORMATION CENTER

Energy Abstracts for Policy Analysis (EAPA)

A monthly abstract journal devoted to the analysis of energy research, conservation, and policy. Scope and coverage are limited to substantive articles or reports and emphasize the following: programmatic efforts; legislative, regulatory, and other legal aspects; social, economic, and environmental impacts; regional and sectoral analyses; institutional factors, etc. *EAPA* is available from the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402; domestic subscribers $6.00, foreign $7.50 per copy; annual cumulative index, domestic $10.00, foreign $12.50 per copy. The annual subscription price is $70.00 for domestic subscribers and $87.50 for foreign subscribers.

Energy Research Abstracts (ERA)

A comprehensive semimonthly abstract journal devoted to all areas of energy-related information produced by the Department of Energy, other U. S. government organizations, and foreign governments. *ERA* is available to the public on a subscription basis from the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402. The subscription rate for the 24 semimonthly issues is $165.00 for domestic subscribers and $206.25 for foreign subscribers. A single issue costs $9.50 (domestic) or $11.90 (foreign).

The following publications are available to the public on a subscription basis from the National Technical Information Service (NTIS), Springfield, Virginia 22161. The annual subscription rate for one volume (calendar) year (12 issues plus cumulative index) is $75.00 for domestic subscribers and $150.00 for subscribers outside the North American continent, except as listed below for *DOE Patents Available for Licensing (PAL).* A single issue is $7.00 (domestic) and $14.00 (outside the North American continent).

Current Energy Patents (CEP)

A monthly publication providing abstracting and indexing coverage of the international patent literature, including patent applications, that concerns any aspect of energy production, conservation, and utilization. Available as PB83-902800.

DOE Patents Available for Licensing (PAL)

DOE is prepared to grant exclusive or nonexclusive, revocable licenses under DOE-owned U. S. patents and patent applications; this semiannual publication provides abstracting and indexing coverage to this literature. Available as PB83-946800; the annual subscription price is $14.00 (domestic) and $28.00 (foreign).

Energy and the Environment (EAE)

A monthly abstract journal devoted to information on the impacts of energy-related activities and radioactive and nonradioactive pollutants on the environment. Available as PB83-914900.

Fossil Energy Update (FEU)

A monthly abstract journal devoted to information on the processing and use of fossil fuels. Available as PB83-914600.

Fusion Energy Update (CFU)

A monthly abstract journal devoted to information on controlled thermonuclear research. Available as PB83-915300.

Solar Energy Update (SEU)

A monthly abstract journal devoted to information on the utilization of solar energy, including biomass and tidal and wind power. Available as PB83-914500.

The following publications are available from the National Technical Information Service (NTIS), Springfield, Virginia 22161. The annual rate for one volume (calendar) year (24 issues) is $40.00 for domestic subscribers and $80.00 for subscribers outside the North American continent.

Direct Energy Conversion (DEC)

A semimonthly current awareness bulletin covering the following areas: photovoltaics, magnetohydrodynamics, electrohydrodynamics, thermoelectrics, thermionics, and fuel cells. Available as PB83-946600.

Geothermal Energy Technology (GET)

A semimonthly current awareness bulletin devoted to information on the exploration and development of geothermal resources. Available as PB83-914700.

Nuclear Fuel Cycle (NFC)

A semimonthly current awareness bulletin covering all aspects of the nuclear fuel cycle, both front end and back end. Available as PB83-913400.

Nuclear Reactor Safety (NRS)

A semimonthly current awareness bulletin covering the following safety aspects: accident analysis, safety systems, radiation protection, decommissioning and dismantling, and security measures. Available as PB83-913500.

Radioactive Waste Management (RWM)

A semimonthly current awareness bulletin covering the following management aspects: transport and storage, waste processing, waste disposal, waste storage, radioactive effluents, and shipping containers. Available as PB83-902900.

INTERNATIONAL ENERGY PUBLICATIONS

The Technical Information Center cooperates with the following organizations in the publication of international abstract journals: (1) International Atomic Energy Agency, International Nuclear Information System, Vienna, Austria, for *Atomindex;* (2) International Energy Agency, IEA Coal Research, London, England, for *Coal Abstracts;* and (3) International Energy Agency, Biomass Conversion Technical Information Service, Dublin, Ireland, for *Biomass Abstracts.* In each case, the cognizant foreign agency provides the non-U.S. information to TIC for inclusion in the Energy Data Base; in turn, TIC provides the U.S. information for input into the respective journal.

Atomindex

A semimonthly abstract journal providing worldwide coverage of information on nuclear science and technology. *Atomindex* is available by subscription from UNIPUB, 345 Park Avenue South, New York, NY 10010. The cost of an annual subscription, 24 semimonthly issues and semiannual and annual cumulative indexes, is $290.

Biomass Abstracts

A bimonthly abstract journal with comprehensive coverage of information in any step involved in the eventual conversion of biomass to energy. *Biomass Abstracts* is available free to Department of Energy components and contractors from the Technical Information Center. Non-DOE organizations may obtain *Biomass Abstracts* from Biomass Conversion Technical Information Service, Institute for Industrial Research and Standards, Ballymun Road, Dublin 9, Ireland, for 42 IR pounds per year. Make checks payable to the Institute.

Coal Abstracts

A monthly abstract journal providing comprehensive worldwide coverage of information in the field of coal science and technology. *Coal Abstracts* is available to Department of Energy components and contractors from the Technical Information Center. Non-DOE organizations may obtain *Coal Abstracts* from IEA Coal Research, Technical Information Service, 14-15 Lower Grosvenor Place, London SW1W 0EX, England, for 100 pounds sterling per year.

ENERGY RESEARCH ABSTRACTS

ABOUT THE TECHNICAL INFORMATION CENTER

The Technical Information Center in Oak Ridge, Tennessee, has been the national center for scientific and technical information for the Department of Energy (DOE) and its predecessor agencies since 1946. In developing and managing DOE's technical information program, the Center places under bibliographic control not only DOE-originated information but also worldwide literature on scientific and technical advances in the energy field and announces the source and availability of this information. Whereas the literature of science is emphasized, coverage is extended to DOE programmatic, socioeconomic, environmental, legislative/regulatory energy analysis, and policy-related areas. To accomplish this mission, the Center builds and maintains computerized energy-information data bases and disseminates this information via computerized retrieval systems and announcement publications such as abstracting journals, bibliographies, and update journals. Direct access to the Center's most comprehensive data base, the Energy Data Base, is available to the public through commercial on-line bibliographic retrieval systems. The Energy Data Base and many of the Center's energy-related data bases are available to DOE offices and contractors and to other government agencies via DOE/RECON, the Department's on-line information retrieval system. The Center has developed and maintains systems to record and communicate energy-related research-in-progress information, to catalog official DOE issue-and-policy documents, to maintain a register of DOE public communications publications, to track research report deliverables from DOE contractors, and to test and make available DOE-funded computer software programs with scientific and management applications. The Center also maintains a full-scale publishing capability to serve special publication needs of the Department. To effectively manage DOE's technical information resources, the Center's program is one of continual development and evaluation of new information products, systems, and technologies.

ABOUT *ENERGY RESEARCH ABSTRACTS*

Energy Research Abstracts (ERA) provides abstracting and indexing coverage of all scientific and technical reports, journal articles, conference papers and proceedings, books, patents, theses, and monographs originated by the U. S. Department of Energy, its laboratories, energy centers and contractors. *ERA* also covers other energy information prepared *in report form* by federal and state government organizations, foreign governments, and domestic and foreign universities and research organizations. The user should remain aware that *ERA* coverage of non-report literature is limited to that generated by Department of Energy activity.

ERA is comprehensive in its subject scope, encompassing the DOE's research, development, demonstration, and technological programs resulting from its broad charter for energy sources, supplies, safety, environmental impacts, and regulation.

ERA is available on an exchange basis to universities, research institutions, industrial firms, and publishers of scientific information. Inquiries should be directed to the Technical Information Center, P. O. Box 62, Oak Ridge, Tennessee 37830.

ERA is available to the public on a subscription basis from the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402. The subscription rate for the 24 semimonthly issues is $165.00 for domestic subscribers and $206.25 for foreign subscribers. A single issue costs $9.50 (domestic) or $11.90 (foreign). The cumulative indexes will be available in printed form from the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402, and in microfiche form from the National Technical Information Service, U. S. Department of Commerce, Springfield, Virginia 22161, and from Engineered Systems, P. O. Box 866, Oak Ridge, Tennessee 37830.

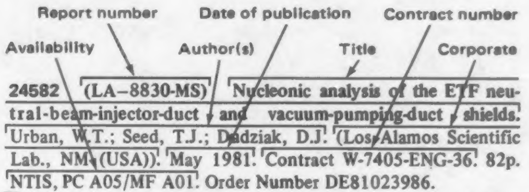
HOW TO USE *ENERGY RESEARCH ABSTRACTS*

ABSTRACTS IN *ENERGY RESEARCH ABSTRACTS*

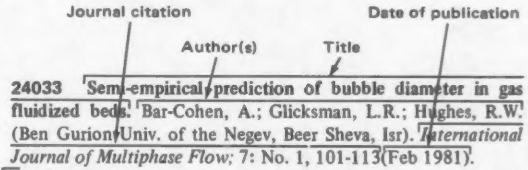
The principal elements of abstract entries for a typical research and development report and a typical technical journal article are illustrated below.



24582 (LA–8830-MS) **Nucleonic analysis of the ETF neutral-beam-injector-duct and vacuum-pumping-duct shields.** Urban, W.T.; Seed, T.J.; Dudziak, D.J. (Los Alamos Scientific Lab., NM (USA)). May 1981. Contract W-7405-ENG-36. 82p. NTIS, PC A05/MF A01. Order Number DE81023986.

Abstract

A nucleonic analysis of the Engineering Test Facility neutral-beam-injector-duct and vacuum-pumping-duct shields has been made using a hybrid Monte Carlo/discrete-ordinates method. This method used Monte Carlo to determine internal and external boundary surface sources for subsequent discrete-ordinates calculations of the neutron and gamma-ray transport through the shields. Confidence was provided in both the hybrid method and the results obtained through a comparison with three-dimensional Monte Carlo results.



24033 **Semi-empirical prediction of bubble diameter in gas fluidized beds.** Bar-Cohen, A.; Glicksman, L.R.; Hughes, R.W. (Ben Gurion Univ. of the Negev, Beer Sheva, Isr). *International Journal of Multiphase Flow;* 7: No. 1, 101-113(Feb 1981).

Abstract

Theoretical expressions for bubble diameter in both small and large particle fluidized beds are derived by the application of two phase theory and gas flow continuity. Comparison with experimental data suggests that the numerical and analytical solution of these expressions, combined with empirical bubble frequency relations, can provide an accurate prediction of bubble size and its parametric trends. 25 refs.

INDEXES TO *ENERGY RESEARCH ABSTRACTS*

Five indexes are provided for approaching the contents of each issue of *Energy Research Abstracts (ERA).* Each index is preceded by an introduction that details the organization of the index and the principles by which it was compiled. The reader is referred to these introductions for information not found in the index examples that follow.

• Corporate Author Index

Technical report literature is indexed using the name of the organization or institution responsible for the issuance of the report.

24582 (LA–8830-MS) Nucleonic analysis of the ETF neutral-beam-injector-duct and vacuum-pumping-duct shields. Urban, W.T.; Seed, T.J.; Dudziak, D.J. **(Los Alamos Scientific Lab., NM (USA)).** May 1981. Contract W-7405-ENG-36. 82p. NTIS, PC A05/MF A01. Order Number DE81023986.

is indexed as:

Los Alamos Scientific Lab., NM (USA)
Nucleonic analysis of the ETF neutral-beam-injector-duct and vacuum-pumping-duct shields, 6:24582 (R:US)

• Personal Author Index

Each author's name is indexed in the form appearing on the document abstracted, with the exception that given names are reduced to initials:

Bar-Cohen, A., Semi-empirical prediction of bubble diameter in gas fluidized beds, 7:24033 (J:US)
Dudziak, D.J., *See* Urban, W.T., 6:24582
Glicksman, L.R., *See* Bar-Cohen, A., 7:24033
Hughes, R.W., *See* Bar-Cohen, A., 7:24033
Seed, T.J., *See* Urban, W.T., 6:24582
Urban, W.T., Nucleonic analysis of the ETF neutral-beam-injector-duct and vacuum-pumping-duct shields, 6:24582 (R:US)

• Subject Index

The subject index consisting of entries naming specific materials, objects, and processes is arranged alphabetically. Document titles, informative phrases, or both specific to these entries are arranged alphabetically under the entries.

TOKAMAK ETF
Neutral Atom Beam Injection
Nucleonic analysis of the ETF neutral-beam-injector-duct and vacuum-pumping-duct shields, 6:24582 (R:US)
Neutron Transport
Nucleonic analysis of the ETF neutral-beam-injector-duct and vacuum-pumping-duct shields, 6:24582 (R:US)

• Contract Number Index

DOE technical literature is indexed using contract numbers under which the literature was produced. This index contains the contract number with corresponding abstract and report numbers.

W-7405-ENG-36	**Los Alamos National Lab., NM (USA)**	
	6:24582	LA–8830-MS

• Report Number Index

Technical report literature is also indexed using report numbers. This index includes information on where individual reports may be obtained. Patents and conference papers are indexed here as a matter of convenience. When a report is supplied under an Order Number, that number is included in the availability statement. An Order Number–Report Number Correlation is included for convenience.

LA–8830-MS	6:24582	NTIS, PC A05/MF A01. Order Number DE81023986, Distribution Category STD-20d

Communication concerning the editorial policy and content of *Energy Research Abstracts* should be addressed to the Editor, *Energy Research Abstracts*, Technical Information Center, P. O. Box 62, Oak Ridge, Tennessee 37830.

SUBJECT CONTENTS (NUMERICAL LISTING)

Six-digit subject category numbers are used in the storage, retrieval, and manipulation of bibliographic information entered into DOE's computerized bibliographic information system. The six-digit category numbers are utilized as if they were three pairs of two-digit numbers, the first two pairs being used to arrange the abstract content of *Energy Research Abstracts.* The following listing includes the totality of the 40 first-level and 294 second-level subject categories used. Because each issue of *ERA* announces only those documents becoming available during a semimonthly period, some subject categories may not be represented in every issue. The complete subject category scheme with scope notes is available as DOE/TIC-4584-R4 from NTIS for $7.00.

ENERGY RESEARCH ABSTRACTS

01 COAL AND COAL PRODUCTS

19398 (DOE/EIA—0064(82)) **Coal data: a reference.** Slatick, E.R. (USDOE Energy Information Administration, Washington, DC. Office of Coal, Nuclear, Electric and Alternate Fuels). Oct 1982. 74p. NTIS, PC A04/MF A01. Order Number DE83008013.

This document contains a summary of information and data about the coal industry in the United States. Separate sections are provided for descriptions of coal deposits, resources and reserves, production and mining, preparation, transport and handling, tracing the history of coal, supply, consumption, coal and coke trade, and new ways to use coal. It also contains numerical data on the above topics and a section on coal terminology and related information, statistical data, illustrations, maps, and photographs. Selected references and sources of information are listed for the reader interested in going beyond the scope of this report. (DMC)

19399 **(DOE/FE/60138—T1) Final report for technical, scientific, engineering support to the Office of Fossil Energy.** (Pyros, Inc., Gaithersburg, MD (USA)). Oct 1982. Contract AC01-82FE60138. 19p. NTIS, PC A02/MF A01. Order Number DE83008562.

Various support work in planning and evaluating certain fossil energy research programs and determining priorities and goals are discussed briefly. The major effort seems to have been a study of Future World Oil Prices: Review of Current Forecasts, Identification of Price-determining Factors and Delineation of a Quantitative Framework for Analysis (DOE/FE/60138—T2), September 16, 1982. Most of the rest of this work appears to have been regarded as internal and was not distributed further. (LTN)

19400 **(ACIRL-PR—82-2) Design and commissioning of a 2 to 5 kg/h continuous reactor unit (CRU Mark II).** Bennett, P.A. (Australian Coal Industry Research Labs. Ltd., North Ryde). Jan 1982. 36p. Australian Coal Industry Research Labs. Ltd., North Ryde.

The design and commissioning of an upgraded continuous reactor (CRU Mark II) for studying the hydroliquefaction of coal is described. The reactor can be operated under a wider range of process conditions than the CRU Mark I. The improvements made to the CRU Mark II are outlined. These improvements enable both SRC and new German processes to be studied. (10 refs.)

19401 **(CONF-800878—) Seventh annual international conference on coal gasification, liquefaction, and conversion to electricity.** Brainard, A.J. (ed.). (Pittsburgh Univ., PA (USA). Dept. of Chemical and Petroleum Engineering). 1980. 518p. Univ. of Pittsburgh, Dept. of Chemical and Petroleum Engineering, Pittsburgh, PA 15261.

From 7. annual international conference on coal gasification, liquefaction, and conversion to electricity; Pittsburgh, PA, USA (5 Aug 1980).

The seventh annual international conference on coal gasification, liquefaction, and conversion to electricity was held August 5-7, 1980, at the Department of Chemical and Petroleum Engineering, University of Pittsburgh, Pennsylvania. Twenty-five papers have been entered individually into EDB and ERA. Two papers had been enered previously from other sources. (LTN)

19402 (CONF-800878—, pp 39-56) **Governmental and industrial measurements in the fields of coal gasification and coal liquefaction in the Federal Republic of Germany.** Duecker, R. (Ruhrkohle Oel Und Gas Gmbh, Essen, Germany). 1980. Univ. of Pittsburgh, Dept. of Chemical and Petroleum Engineering, Pittsburgh, PA 15261.

From 7. annual international conference on coal gasification, liquefaction, and conversion to electricity; Pittsburgh, PA, USA (5 Aug 1980).

This brief survey of the German Coal Conversion Program issued by the federal government in January 1980, indicates to what extent the further improvement of new coal gasification and liquefaction technologies has to be supported. In the course of the past two energy programs 1974-1980, the federal government has already contributed funds up to about 800 m US$ for the general development of coal extraction and conversion technologies. More than 90% of these funds were from industry which in return contributes with remarkable funds of its own, the average of the industrial contribution in the field of coal research amounting to about 40% of the total cost so that the overall sum for these projects amount to approximately 2 b US$. Adding the contribution of the state governments of Northrhine-Westphalia and Saarland, the sum for the general coal research program amounts to more than 2.3 b US$ for 1974 until today. These are enourmous efforts for an area of production in which only 1% of all West German employees are engaged; contributing about 1% of the German gross national product. In view of today's worldwide energy situation and recent political developments in some of the OPEC countries, these governmental efforts have already been justified and necessary in order to ensure a long term flexible supply of energy in the Federal Republic of Germany.

19403 (CONF-800878—, pp 57-80) **Exxon donor solvent coal liquefaction process: development program status.** Epperly, W.R.; Plumlee, K.W.; Wade, D.T. (Exxon Research and Engineering Co., Florham Park, NJ). 1980. Univ. of Pittsburgh, Dept. of Chemical and Petroleum Engineering, Pittsburgh, PA 15261.

From 7. annual international conference on coal gasification, liquefaction, and conversion to electricity; Pittsburgh, PA, USA (5 Aug 1980).

The status of the Exxon Donor Solvent Coal Liquefaction Process Development Program is reviewed. Included in the overview of this government-industry cost-shared development is a description of Exxon's integrated approach to the project. The status of the laboratory and engineering research and development studies, along with an up-to-date status of the 250 T/D large pilot plant demonstration, are presented. The process description includes discussions of coal feed flexibility and product flexibility. Potential product utilization schemes, including direct utilization and various conventional upgrading routes, are surveyed. The project environmental program philosophy and studies are described. The economic outlook for the EDS process and the effects of various bases is presented, concluding with consideration of the prospects for commercialization.

19404 (CONF-800878—, pp 81-99) **Current status of H-Coal commercialization.** Stotler, H.H.; MacArthur, J.B.; Comolli, A.G. (Hydrocarbon Research, Inc., Lawrenceville, NJ). 1980. Univ. of Pittsburgh, Dept. of Chemical and Petroleum Engineering, Pittsburgh, PA 15261.

From 7. annual international conference on coal gasification, liquefaction, and conversion to electricity; Pittsburgh, PA, USA (5 Aug 1980).

H-Coal is a direct catalytic hydroliquefacion process for converting coal into high quality, clean liquids. The process uses the commercially proven ebullating-bed reactor to achieve superior distillate yields in the range of 40 to 50 weight percent from a wide variety of coals. Having been thoroughly and successfully tested in laboratory equipment at coal capacities up to 3.5 tons per day, H-Coal is now being demonstrated in commercial-size equipment at the 600 ton-per-day pilot plant in Catlettsburg, Kentucky. Design of a commercial H-Coal plant has been initiated under sponsorship of the Department of Energy. A comparative economic study of several coal liquefaction processes prepared for the US Department of Energy suggests that the H-Coal syncrude mode operation is a front-runner in terms of lowest product cost.

19405 (CONF-800878—, pp 100-110) **Sasol: tons to barrels, now.** Samuel, W.A. (Fluor Engineers and Constructors, Inc., Irvine, CA). 1980. Univ. of Pittsburgh, Dept. of Chemical and Petroleum Engineering, Pittsburgh, PA 15261.

From 7. annual international conference on coal gasification, liquefaction, and conversion to electricity; Pittsburgh, PA, USA (5 Aug 1980).

Each plant (Sasol II and Sasol III) is designed to process about 40,000 tons of coal per day. A simplified flow sheet entitled Sasol Synthol Process illustrates the overall process scheme for both Sasol Two and Sasol Three. In the following section we discuss each of these units in some detail. The following is a general description. Coal passes from the mine to the coal preparation units and then to the power stations and to the Lurgi gasification system. Air enters the air separation system to supply the oxygen which passes to the Lurgi apparatus along with most of the steam from the power station. In the gasifiers, the reactions occur to produce a raw gas which includes tars and some aqueous chemicals. These are separated in the quench system, with the tars going to further refining and the aqueous gas liquor going to units to recover those chemicals. The raw gas proceeds to a Lurgi Rectisol system for removal of the acid gas constituents to produce a pure gas suitable for Fischer-Tropsch reaction. This material goes to the Synthol fluid bed system along with hydrogen and carbon monoxide produced by reforming the methane produced in the gasification reactor. The reaction products from the Synthol system go to a product recovery unit from which the ethylene is separated as a salable chemical. The methane goes to the methane reforming unit, and the other products are sent to a product refinery from which are produced the LPG, gasoline, diesel, fuel oil, jet fuel, and other chemicals as noted on the flow sheet.

19406 (CONF-800878—, pp 111-129) **Comparison of different Fischer-Tropsch processes.** Deckwer, W.D. (Univ. of Hannover, West Germany). 1980. Univ. of Pittsburgh, Dept. of Chemical and Petroleum Engineering, Pittsburgh, PA 15261.

From 7. annual international conference on coal gasification, liquefaction, and conversion to electricity; Pittsburgh, PA, USA (5 Aug 1980).

Various FT processes have been proposed and either used commercially or tested extensively. They differ particularly on the type of reactor and the kind of heat removal. It is the reactor and its operational conditions which determine the product distribution and the upgrading scheme. At first, one can roughly distinguish between FT processes with stationary and mobile catalyst phase. Among the various fixed bed processes it is only the ARGE reactor which meets the present standards of fixed bed reactor technology and offers high performance and production capacities. Reactors with mobile catalysts are fluidized beds (Hydrocarbon Research Inc.), entrained fluidized beds (Sasol, Kellogg), the three-phase slurry reactor (Rheinpreussen-Koppers), and the three-phase fluidized bed and fixed bed reactors with oil circulation (BASF, Bureau of Mines). The ARGE process and the entrained bed reactor, which both are commercialized by Sasol, are treated briefly. Though these two processes work successfully and profitably this must not necessarily imply that they are optimal choices under all circumstances. Other technologies may prove viable too, and, possibly, may be better suited under certain conditions to produce synthetic fuels. In particular, three-phase reactor technology has experienced a fast development, and the aspects to carry out the FT synthesis in 3-phase reactors appear very promising. Therefore, the Rheinpreussen-Koppers slurry process and the oil circulation processes of the Bureau of Mines are considered and briefly characterized.

19407 (CONF-800878—, pp 130-152) **Demonstration and commercialization of the SRC-I technology.** Tao, J.C.; Bixler, A.D.; Breyne, E.J. (International Coal Refining Co., Allentown, PA). 1980. Univ. of Pittsburgh, Dept. of Chemical and Petroleum Engineering, Pittsburgh, PA 15261. Contract AC05-78OR03054.

From 7. annual international conference on coal gasification, liquefaction, and conversion to electricity; Pittsburgh, PA, USA (5 Aug 1980).

The Solvent Refined Coal (SRC-I) Process, one of the most advanced direct coal liquefaction processes available, has attracted national attention because (1) it is a partial answer to the energy crisis and (2) it is an answer that is about to be implemented. A 6000 tons per day SRC-I Demonstration Plant is now being designed and will be constructed and operated by the International Coal Refining Company (ICRC) - partnership of Air Products and Chemicals, Inc., and Wheelabrator-Frye Inc. - under contract to the Department of Energy (DOE). The project, which is already in the detailed engineering phase, has scheduled operations at the Demonstration Plant, in Newman, KY, to begin by late 1984. Expansion to commercial product, 30,000 TPD, is planned for 1990. This paper discusses the selection of major technologies for both the Demonstration Plant and the Commerical Plant. For the Demonstration Plant it presents the analyses that governed the selection of technologies for four processing steps: deashing, gasification of the mineral ash residue to produce hydrogen, product cooling or solidification of the SRC, and expanded-bed hydrocracking to convert the SRC to liquid fuels. For the Commercial Plant it discusses the overall design of that expanded operation, the projected product slate, product costs - comparing SRC costs with projected oil prices for the next decade when the Commercial Plant will be operating - financing assumptions, and schedule.

19408 (CONF-800878—, pp 153-163) **Coal-based ammonia and methanol manufacture using Koppers-Totzek gasification.** Engelbrecht, A.D.; Partridge, L.F. (AECI Ltd., Modderfontein, South Africa). 1980. Univ. of Pittsburgh, Dept. of Chemical and Petroleum Engineering, Pittsburgh, PA 15261.

From 7. annual international conference on coal gasification, liquefaction, and conversion to electricity; Pittsburgh, PA, USA (5 Aug 1980).

A coal-based ammonia and methanol plant, using Koppers-Totzek gasification, has been operated for over 5 years by AECI Limited in Modderfontein, South Africa. Capacity of the plant is 1000 metric tons/day of combined ammonia and methanol, and the plant forms part of a chemical complex producing nitrogen fertilizers and explosives. This paper provides a description of the process and briefly reviews the experience we have had in operating a modern coal-based ammonia and methanol plant. The Koppers-Totzek gasification process is described in some detail since the objective of this conference session is primarily to present operating experience with existing commercialized coal gasification technology. A subject which is receiving considerable attention at this time in relation to coal conversion processes is environmental impacts, and this topic is considered in relation to the Koppers-Totzek based plant at Modderfontein. In the light of AECI experience the Koppers-Totzek gasification process offers distinct advantages for production of synthesis gas from coal, for applications such as ammonia and methanol manufacture. Production of a clean raw gas with no byproducts (hydrocarbons, aromatics or phenols) and minimal environmental impact make it a suitable process for integration into a chemicals manufacturing complex such as Modderfontein. Although initially plant reliability was poor, availability has continually improved and considering the complexity of a coal-based plant such as this when compared to gas or oil-based plants, the availability currently achieved is highly gratifying. As a fully commercialized process, Koppers-Totzek gasification must be considered as a candidate for production of synthesis gas from coal for projects under evaluation over the next 5 to 10 years.

19409 (CONF-800878—, pp 164-179) **Operating experience gained with the PKM/GSP coal fixed bed pressure gasification process.** Schutter, W. (Industrieanlagen, Import, Berlin, East Germany); Genauck, P. 1980. Univ. of Pittsburgh, Dept. of Chemical and Petroleum Engineering, Pittsburgh, PA 15261.

From 7. annual international conference on coal gasification, liquefaction, and conversion to electricity; Pittsburgh, PA, USA (5 Aug 1980).

Essentially, the economical results achieved are dependent on construction details and on the overall operating principle of a plant. In this respect, a great number of measures to improve gasifier operation have already proved successful. In this connection, reference may be made to some concepts covered in other publications. Fully automatic charging system using the concept of electrohydraulic control and filling level indication by means of radioactive isotopes; centralized hydraulic system for operating the coal and ash lock hoppers as well as the drive elements of the rotary grates; use of a fire-resistant hydraulic fluid; a combination of process instrumentation and control equipment in a control centre for a reliable performance of all equipment for operation and safety monitoring; open-air structures superior to structural arrangements used so far in pressure gasworks; concepts for dust removal using Venturi scrubbers incorporated in arrangement of gasifier - scrubber cooler-waste heat broiler - raw gas purification; processing of gas liquors containing dust subsequent to their expansion in large tanks; control of corrosion of the inner shell of lined gasifiers by using cladded materials; reduction of wear in piping and elements particularly susceptible to wear; and improvement of the drive elements and supports of rotary grates.

19410 (CONF-800878—, pp 180-199) **Development of the Shell-Koppers coal gasification process.** Vogt, E.V.; Weller, P.J. (Shell Internationale Petroleum Maatschappij B.V., The Hague, Netherlands). 1980. Univ. of Pittsburgh, Dept. of Chemical and Petroleum Engineering, Pittsburgh, PA 15261.

From 7. annual international conference on coal gasification, liquefaction, and conversion to electricity; Pittsburgh, PA, USA (5 Aug 1980).

The Shell-Koppers process for the gasification of coal under pressure, based on the principles of entrained bed technology, is characterized by: practically complete gasification of virtually all solid fuels; production of a clean gas without byproducts; high throughput; high thermal efficiency and efficient heat recovery; and environmental acceptability. There are numerous possible future applications for this process. The gas produced (93 to 98% vol. hydrogen and carbon monoxide) is suitable for the manufacture of hydrogen or reducing gas and, with further processing substitute natural gas (SNG). Moreover, the gas can be used for the synthesis of ammonia, methanol and liquid hydrocarbons. Another possible application of this process is as an integral part of a combined-cycle power station featuring both gas and steam turbines. The integration of a Shell-Koppers coal gasifier with a combined-cycle power station will allow electricity generation at 42 to 45% efficiency for a wide range of feed coals. The development programme includes the operation of a 150 t/d gasifier at Deutsche Shell's Harburg refinery since November 1978 and of a 6 t/d pilot plant at Royal Dutch Shell's Amsterdam laboratories from December 1976 onwards. Both facilities run very successfully. With hard coal a conversion of 99% is reached whilst producing a gas with only 1% vol. CO_2. The next step will be the construction and operation of one or two 1000 t/d prototype plants which are scheduled for commissioning in 1984/85. Towards the end of the eighties large commercial units with a capacity of 2500 t/d are contemplated. The economics, especially of these large-size units, is very competitive.

19411 (CONF-800878—, pp 217-232) **Winkler fluid bed coal gasification experience with low grade coals.** Boegner, F. (Davy International AG, Cologne, West Germany); Kendron, T.J.; Subramanian, T.K. 1980. Univ. of Pittsburgh, Dept. of Chemical and Petroleum Engineering, Pittsburgh, PA 15261.

From 7. annual international conference on coal gasification, liquefaction, and conversion to electricity; Pittsburgh, PA, USA (5 Aug 1980).

One of the proven commercial systems in the gasification of carbonaceous material is the Winkler fluid bed process. This process has been commercially used in the production of: low and medium Btu industrial gas; synthesis gas for ammonia, methanol and oxo-alcohols; Fischer-Tropsch synthesis gas; reducing gas; and hydrogen. The Winkler fluid bed process is well suited for more reactive, young carbonaceous materials like peat, lignite and subbituminous coals which are available in abundance around the world. Low grade coals with a high percentage of fines in the range of 0 to 3/8-inch, high ash content up to 50%, and high sulfur content have been successfully gasified in the commercial Winkler gasifiers. These gasifiers have performed with high efficiency, especially when the ash fusion temperature is in the range of 2000 to 3000°F as found in the majority of US coals. For commercial plants it should be remembered that, though the economy of total production depends upon gasification efficiency which varies from process to process only in a small range, it is very important to have high performance and reliability in the gasification process and related equipment. The paper describes how the Winkler fluid bed gasification has been improved and simplified in both operation and maintenance for commercial plants.

19412 (CONF-800878—, pp 304-334) **Coal Gasifier Cogeneration Power Plant Project.** Bloomfield, H.S. (NASA, Lewis Research Center, Cleveland, OH). 1980. Univ. of Pittsburgh, Dept. of Chemical and Petroleum Engineering, Pittsburgh, PA 15261.

From 7. annual international conference on coal gasification, liquefaction, and conversion to electricity; Pittsburgh, PA, USA (5 Aug 1980).

A unique power plant comprised primarily of commercially available equipment and using high sulfur coal in an environmentally acceptable manner is currently under study by NASA for installation at its Lewis Research Center (LeRC), Cleveland, Ohio, facility to supply total steam requirements together with a major portion of its electrical load. The plant size will be appropriate to industrial, or small utility, integrated gasifier combined cycle applications. The facility is of high modular design that will provide both process heat and electricity at high efficiency. This paper gives a good description of the engineering considerations and technical feasibility; the project is not yet complete so the economics may still be in question. (LTN)

19413 (CONF-800878—, pp 335-351) **Commercialization of coal gasification in the US: Great Plains Gasification Associates.** Boulanger, R.E. (American Natural Service Co., Detroit, MI). 1980. Univ. of Pittsburgh, Dept. of Chemical and Petroleum Engineering, Pittsburgh, PA 15261.

From 7. annual international conference on coal gasification, liquefaction, and conversion to electricity; Pittsburgh, PA, USA (5 Aug 1980).

The Great Plains coal gasification project is, as the title implies, a project designed to convert coal into synthetic natural gas. The plant is designed to produce an average of 125 million cubic feet per day of high-Btu, pipeline quality synthetic gas from North Dakota lignite coal. The plant would be located at the mine site in North Dakota, use water from the Missouri River and produce gas that is completely interchangeable with natural gas. The five companies that are partners in the project are affiliates of companies which supply approximately one-third of the interstate natural gas used in this country, in turn natural gas represents approximately 30% of our nation's energy requirement. The total cost of the project is expected to be about $1.5 billion including the mine, but excluding capital costs during construction and any required new pipeline facilities. Approximately $1.2 billion of the project costs would be debt and the remainder equity. The principle parties to the project are identified in Exhibit I. The size of the project, its unique nature, the regulatory interplay, all contributed issues which required careful consideration and negotiation in developing a financing plan.

19414 (CONF-800878—, pp 352-362) **Conoco's program for production of methanol from coal.** Bowden, J.R. (Conoco Coal Development Co., Stamford, CT). 1980. Univ. of Pittsburgh, Dept. of Chemical and Petroleum Engineering, Pittsburgh, PA 15261.

From 7. annual international conference on coal gasification, liquefaction, and conversion to electricity; Pittsburgh, PA, USA (5 Aug 1980).

Conoco's commercial program is based on four premises. First, we believe Conoco's principal interest and main profit potential lies in liquid fuels; so we propose that Conoco take only the methanol from co-production (fuel gas and methanol) plants and sell, or upgrade and sell, methanol in our own channels. Second, we believe there are significant profit opportunities in an efficient manufacturing and distribution network throughout the United States; so we see the full development of this concept requiring multiple plant locations sited across the country. Third, the capital requirements for multiple plants are enormous; so we foresee, at least for the first few plants, joint venture arrangements with partners whose primary interests are in the gas produced in these plants. Fourth, although present technology clearly favors co-production, technology probably will develop which will enable us to construct wholly-owned methanol-only plants, thus, simplifying our business relationships. The prime target market for our methanol production is the power generating utility market. Here methanol has been demonstrated, in a joint EPRI-Southern California Edison Test Program, to be a fuel superior to either gas or distillate fuel for use in stationary gas turbines. At first, transportation uses will represent a secondary market for methanol, although we expect ultimately this will be the primary market.

19415 (CONF-800878—, pp 363-374) **Status of the Cool Water Coal Gasification Program.** Papay, L.T. (Southern California Edison Co., Rosemead, CA). 1980. Univ. of Pittsburgh, Dept. of Chemical and Petroleum Engineering, Pittsburgh, PA 15261.

From 7. annual international conference on coal gasification, liquefaction, and conversion to electricity; Pittsburgh, PA, USA (5 Aug 1980).

The Southern California Edison Company and Texaco Inc., announced formation of the Cool Water Coal Gasification Program on July 31, 1979. The Program is designed to demonstrate technical and economic feasibility of the Texaco Coal Gasification Process, one of the leading processes for producing a clean synthetic fuel from coal. This proposed joint venture has a capital cost estimate of approximately $300 million. It involves the design, construction and demonstration of an integrated 100 megawatt coal gasification/combined-cycle electric generating facility on the commercial scale of 1000 tons per day coal feed rate. In addition to advancing the state-of-the-art, the Cool Water Program has unique features in its arrangements for program funding. Both technical and financial participation is being sought from a variety of industrial organizations which have the collective ability to commercially transfer proven hardware from the demonstration program to the competitive marketplace. Also, Program Participants have the opportunity to receive full recovery of their contributed funds by means of a fuel processing fee based on the actual amount of synthesis gas produced by the facility. To date, approximately one-half of required funding has been identified. Efforts are continuing to obtain additional commitments from other prospective parties. California environmental permits are in place, engineering design work has commenced, and testing of the plant is expected to begin about the end of 1983. This Program is expected to be a successful step toward eventual commercialization of large-scale coal conversion technology to supply fuel to future combined-cycle plants, a fuel to existing boilers, and a possible fuel for other advanced energy systems such as fuel cells.

19416 (CONF-800878—, pp 375-393) **Aspects of commercial medium Btu coal gasification.** Wellborn, S.G. (E.I. du Pont de Nemours and Co., Inc., Wilmington, DE). 1980. Univ. of Pittsburgh, Dept. of Chemical and Petroleum Engineering, Pittsburgh, PA 15261.

From 7. annual international conference on coal gasification, liquefaction, and conversion to electricity; Pittsburgh, PA, USA (5 Aug 1980).

Combustion characteristics and thermal efficiency make MBG gas a lowest cost alternative. MBG has environmental advantages over most other synfuels and the direct combustion of coal. For those who use hydrogen and carbon monoxide, it has excellent feedstock characteristics. The commercial concept we see as most attractive is where a large scale gasification plant pipelines the product to a concentrated industrial area for consumption by multiple users. To fully achieve the economy of scale inherent in coal conversion processes, a very large facility is required. The energy output here is roughly 50,000 B/DoE. The coal supply requires large mines. Investment and operating costs exceed the assets of many responsible companies in the United States, as you well know. This is largely due to the extended chain of elements required to make up a viable commercial venture. It is the integration of this sequence of elements, each one of which is a major project in its own right by normal standards, that is a major aspect of a commercialization effort. A number of different types of industries and capabilities are needed to build such a chain and deal wih the scale of the undertaking. The appropriateness of a joint venture approach seems obvious. The talents of the mining industry, transportation industry - both for the coal and the product gas pipelining, an industry for gasification and, of course, the consumption by user industries and utilities must be melded together for success. A very important aspect of the melding is participant characteristics.

19417 (CONF-800878—, pp 394-398) **Role of coal gasification in the future supply and demand for gas energy in the US.** Schlesinger, B.; German, M.I. (American Gas Association, Arlington, VA). 1980. Univ. of Pittsburgh, Dept. of Chemical and Petroleum Engineering, Pittsburgh, PA 15261.

From 7. annual international conference on coal gasification, liquefaction, and conversion to electricity; Pittsburgh, PA, USA (5 Aug 1980).

Synthetic gas from coal can begin to make a modest contribution to US gas supplies during the 1980's, potentially rising to the equivalent of 300,000 barrels per day of oil or more by 1990. The first several US commercial synthetic coal gas plants are proposed for Western US locations and will utilize the Lurgi process followed by a methanation step. Following successful demonstrations at full commercial scale during the 1980's synthetic coal gasification at a potpourri of US locations, and using a variety of coal and technologies, can combine to produce far greater quantities of synthetic pipeline gas, potentially contributing 3.6 Tcf (about 1.6 million barrels/day oil equivalent) to US gas supplies by the year 2000. The gas produced from high-Btu coal gasification plants built over the next five years will be a competitive fuel for residential, commercial and industrial consumers. Product cost estimates made by project sponsors indicate coal gas will be competitive with foreign oil and unconventional natural gas. Plants projected to come on line in the mid-1980's have forecast product prices competitive with pipeline supplies in the first year of operation. Given successful resolution of the Great Plains Coal Gasification project tariff in court, the principal regulatory constraint to commercialization of coal gasification technology will shift from the economic, technical and regulatory barriers faced by individual projects to general marketing constraints on gas.

19418 (CONF-800878—, pp 399-430) **Real cost of synthetic fuels.** Louks, B.M.; Gluckman, M.J. 1980. Univ. of Pittsburgh, Dept. of Chemical and Petroleum Engineering, Pittsburgh, PA 15261.

From 7. annual international conference on coal gasification, liquefaction, and conversion to electricity; Pittsburgh, PA, USA (5 Aug 1980).

The major purpose of this paper is to bring forth the real cost of an almost forgotten synfuel - intermediate-Btu gas. Our experience is that a large fraction of the energy community limits its thinking almost exclusively to SNG when they are called on to deliberate about coal gasification. Results of EPRI studies of the costs of intermediate-Btu gas, which we think will be more useful, will be presented. The results should be useful to those who need more complete knowledge of coal gasification products. Costs of intermediate-Btu gas will be presented in mid-1979 dollars. This may not be acceptable to those who believe future inflation needs to be included in cost analyses. Accordingly, another purpose of this paper is to present an engineering economics methodology which permits the estimator to forget about using inflation. Its use has never really been required, and it is hoped that this paper will convince the synfuel community that this is true.

19419 **(CONF-810417—11) Process-control instrumentation for advanced fossil-energy processes.** Doering, R.W.; O'Fallon, N.M. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 19p. NTIS, PC A02/MF A01. Order Number DE83007791.

From 90. AICHE national meeting; Houston, TX, USA (5 Apr 1981).

Instrumentation required for control of large-scale surface processes for coal and oil shale is lacking in a few critical areas. A recent study by Argonne National Laobratory (ANL) to specify the required instrumentation is reviewed. Work at ANL and other places to develop instruments for multiphase mass-flow measurements, on-line analysis, temperature, and level is described briefly.

19420 **(CONF-810528—17) Refractory/coal-slag compatibility studies: progress to date.** Kennedy, C.R. (Argonne National Lab., IL (USA)). Aug 1981. Contract W-31-109-ENG-38. 30p. NTIS, PC A03/MF A01. Order Number DE83007742.

From 83. symposium on nucleation and crystallization in glasses; Washington, DC, USA (3 May 1981).

Approximately 60 different refractories have been exposed to both acidic and basic molten coal slags at temperatures between 1500 and 1600°C. A dense fused-cast chrome-spinel refractory has demonstrated superior resistance to corrosion by a wide variety of coal slags ($CaO/SiO_2 = 0.2$ to 1.7). Refractories containing $>30\%$ chromia reacted with all types of slags to form complex spinel reaction products. Alumina refractories were intermediate in performance in acidic slags and poor in basic slags. Magnesia-chrome refractories containing free MgO performed poorly in acidic slags, but somewhat better in basic slags. Preferential dissolution of MgO was observed in all cases. 12 figures.

19421 **(CONF-821094—2) Chemistry of ash deposits in the U-GAS process.** Mason, D.M.; Rehmat, A.; Tsao, K.C. (Institute of Gas Technology, Chicago, IL (USA); Wisconsin Univ., Milwaukee (USA)). 1982. Contract AC21-82MC19301. 20p. NTIS, PC A02/MF A01.

From International conference on fouling of heat exchangers; White Haven, PA, USA (31 Oct 1982).

A cyclone operating at tempertures near that of the reactor fluidized bed has been used in the U-GAS pilot plant gasifier to remove entrained char particles from the product gas and return them to the bed. Essentially pure coal ash has been found to deposit in this hot cyclone. The deposits have been chemically analyzed and examined by optical and scanning electron microscopy. Ferrous sulfide is repsonsible for deposition under adverse conditions, but deposition of iron-rich ferrous aluminosilicates is the more serious problem. Deposition can be prevented by jacketing and cooling the wall surface of the cyclone. The effects of wall and gas temperatures have been investigated by means of a laboratory hot cyclone. The relationship of slag properties to deposition is briefly considered. 8 figures, 5 tables.

19422 **(CONF-821145—4) Corrosion and thermal-shock studies on slagging-coal-gasifier refractories.** Diercks, D.R.; Greenberg, S.; Bandyopadhyay, G. (Argonne National Lab., IL (USA)). Sep 1982. Contract W-31-109-ENG-38. 31p. NTIS, PC A03/MF A01. Order Number DE83007735.

From 7. materials for coal conversion and utilization conference; Gaithersburg, MD, USA (16 Nov 1982).

Refractory linings in slagging-coal gasifiers are subject to two principal modes of failure; wastage due to corrosive/erosive attack by the slag and cracking, spallation, and disintegration due to thermal shock. An extensive corrosion-testing program was conducted on candidate refractories since 1975. That program has recently expanded to include corrosion/erosion testing in moving slag, fundamental studies on corrosion mechanisms and kinetics, thermal-shock testing of commercial refractories, and the development of refractories with improved thermal-shock characteristics. The present paper reviews results obtained in past corrosion screening tests, summarizes work recently completed and presently under way in the expanded program, and briefly discusses future program directions. 11 figures, 7 tables.

19423 **(CONF-8006244—) KDV-pressure gasification of coal.** (Ministerium fuer Wirtschaft, Mittelstand und Verkehr des Landes Nordrhein-Westfalen, Duesseldorf (Germany, F.R.)). Jan 1981. 198p. (In German). NTIS (US Sales Only), PC A09/MF A01. Order Number DE83900169.

From Colloquium on power plants for pressure gasification of coal; Essen, F.R. Germany (18 Jun 1980).

A colloquium was held on pressure gasification of coal with particular regard to the STEAG process; other concepts were only mentioned in passing. As a result, problems of the STEAG process could be discussed in more detail. Various combinations of power plant units are presented with their characteristics, and the Luenen plant is described in detail in order to enable a better classification of problems and their role in the overall concept. There is a report on the coal required for fixed-bed gasifiers which may be of importance for the mining sector as the physical and chemical requirements on the fuel are discussed, and coal preparation and compacting experiments are reported on. Advances in fixed-bed gasifiers are discussed in another paper. Dust removal and desulphurization projects for crude gas are explained in detail as well as waste water treatment. The state of the art of power plant technology for pressure gasification of coal, future trends, and environmental effects of power plants for pressure gasification of coal are discussed.

19424 **(CONF-8210127—1) Coal-gasification-process concepts.** Miller, C.L.; Tarman, P.B. (USDOE Assistant Secretary for Fossil Energy, Washington, DC. Coal Gasification Div.; Institute of Gas Technology, Chicago, IL (USA)). 1982. 21p. NTIS, PC A02/MF A01. Order Number DE83007157.

From Executive coal gas conference - EUROPE 82; Amsterdam, Netherlands (19 Oct 1982).

First Generation coal gasification continues to grow with the expansion of Lurgi process to make gasoline in South Africa and SNG in the United States. This moving-bed gasifier is no doubt the leading commercial application of coal gasification. This can probably be attributed to its operation at the elevated pressure that simultaneously increases coal throughput and broadens the utility of the raw Syngas product by lowering its coal. Other Second Generation processes also strive to achieve high pressure operation: Ruhrgas 100 to improve moving-bed gasification at 100 bars; Texaco, Shell, Koppers, and Saarberg-Otto to improve entrained-bed gasification at 20 to 40 bars; and U-GAS and Westinghouse and the pressurized Winkler to improve fluidized-bed operation at 10 to 40 bars. Operation at 20 to 40 bars greatly improves gasifier productivity and significantly broadens the use of the raw Syngas produced by all types of gasifiers. Future commercial trends will include the entrained- and fluidized-bed concepts at 20 to 40 bars while even higher operating pressures will be used for the Lurgi moving-bed concept.

19425 **(DOE/EIA—0121(81/3Q)) Coke plant report. Quarterly energy data report, July-September 1981.** Vannoy, C.E.; Watson, W.M. (USDOE Energy Information Administration, Washington, DC. Office of Coal, Nuclear, Electric and Alternate Fuels). 1981. 22p. NTIS, PC A02/MF A01. Order Number DE83008050.

This report presents US coke plant data for April through June 1981 covering the following subjects: coal receipts, coal carbonization; coke and breeze production, coke and breeze distribution, coal and coke stocks, and coke imports and exports. Data for the previous quarter (first quarter 1981), the same quarter previous year (second quarter 1980), and for the year to date 1980 and 1981 are also given so that comparisons may be made. The data presented in this report were submitted by all companies producing coke and breeze at US coke plants. There were 58 coke plants in operation during the second quarter of 1981. The term United states includes the 50 states and the District of Columbia.

19426 **(DOE/EIA—0121(81/4Q)) Coke plant report. Quarterly energy data report, October-December 1981.** Vannoy, C.E.; Watson, W.M. (USDOE Energy Information Administration, Washington, DC. Office of Coal, Nuclear, Electric and Alternate Fuels). 27 May 1982. 33p. NTIS, PC A03/MF A01. Order Number DE83008049.

This report presents US coke plant data for October through December 1981 covering the following subjects: coal receipts, coal carbonization, coke and breeze production and distribution, coal and coke stocks, and coke imports and exports. Data for the previous quarter (third quarter 1981), the same quarter for the previous year (fourth quarter 1980), and the year to date for 1980 and 1981 are also given so that comparisons may be made. The data presented in this report were submitted by all companies producing coke and breeze at US coke plants. There were 56 coke plants in operation during the fourth quarter of 1981. The term United states includes the 50 states and the District of Columbia.

19427 **(DOE/ET/10143—T31) H-Coal Pilot Plant: worker health-protection training program at the H-Coal Pilot Plant, E and H-3.** Hill, R.H. (Ashland Synthetic Fuels, Inc., KY (USA)). Dec 1982. Contract AC05-76ET10143. 27p. NTIS, PC A03/MF A01. Order Number DE83006749.

In order to convey factual health protection information to process area workers at the H-Coal Pilot Plant, a slide/tape pesentation and Health Information Brochure were developed. Regular plant workers received training with the slide/tape presentation at least annually. Temporary plant workers received the Health Information Brochure before beginning work in process areas. The training effort was successful in conveying factual toxicity information to workers and training workers to follow safe work practices and personal hygiene procedures.

19428 **(DOE/ET/10143—T34) H-Coal Pilot Plant: radiation safety.** Gray, J.H. (Ashland Synthetic Fuels, Inc., KY (USA)). Nov 1982. Contract AC05-76ET10143. 155p. NTIS, PC A08/MF A01. Order Number DE83005848.

During the design phase of the H-Coal Pilot Plant the instrumentation evaluation for the high pressure vessels indicated the need for nuclear gauges. Therefore, thirty-eight nuclear gauges were installed on 18 vessels at the plant. Their uses ranged from empty/full switches to determining the density of a flowing hydrocarbon stream. Installation and use of nuclear gauges requires a Radioactive Material License granted by Kentucky Department for Human Resources Radiation Control Branch. The processing time from application to license issuance was 13 months. The Radiation Safety Program involved preparing Vessel Entry Procedures, making vessels, writing a Nuclear Safety Manual, and holding training sessions for plant employees. In addition to training personnel in the use of the nuclear gauges, monitoring of the instruments was required. Monitoring was accomplished by wipe testing, surveys and exposure badges. All monitoring results clearly demonstrated the safety of the nuclear gauges. ASFI made any needed repairs and elected on a few installations to add a small amount of shielding to lower the radiation field intensity. These cases were only minor and never involved any risk to plant personnel. The experience at the H-Coal Plant with nuclear gauges has shown them to be safe and sound instruments. Monitoring was performed more often than required, and it can be done less frequently at similar installations. The Radiation Safety program with its signs, documents, procedures and training sessions was quite successful. Many of the Program's features are applicable in any plant with nuclear gauges.

19429 **(DOE/ET/13702—T1) VPI-4.8 - investigation of carbon monoxide disintegration of refractories in coal gasifiers.** Morena, R.; Slusser, L.; Brown, J.J. Jr. (Virginia Polytechnic Inst. and State Univ., Blacksburg (USA). Dept. of Materials Engineering). [nd]. Contract AC05-80ET13702. 6p. NTIS, PC A02/MF A01. Order Number DE83005670.

Refractories used in coal gasification vessels and piping are exposed to mixtures of hydrogen, steam, hydrogen sulfide, methane, carbon monoxide, and other gases over a wide range of tempertures and pressures. Many refractories are known to deteriorate when exposed for long periods of time to CO-containing atmospheres, especially if the temperature is below about 1300°F and if the refractory contains any iron containing compounds. It is, therefore, important to develop experience and engineering data on these refractories under simulated coal gasifying conditions and to attempt to determine the effect of each identifiable variable on the CO resistance of the refractories used in coal gasifiers. The objectives of this investigation are (1) to determine whether or not CO disintegration is likely to occur in the refractories used in coal gasifiers, and (2) identify the conditions under which CO disintegration of the refractories can be expected to be a serious problem. It is also a goal of this investigation to develop information that will assist in the identification of refractory deterioration or failure that is caused by CO disintegration. Results of exposure in a flow-through test vessel (500°C, 1000 psig, 50 h) are given for several costable refractories. The gases involved were CO and simulated gasification atmospheres.

19430 **(DOE/ET/14700—13) Chemistry and catalysis of coal liquefaction: catalytic and thermal upgrading of coal liquid and hydrogenation of CO to produce fuels. Quarterly progress report, October-December 1982.** Wiser, W.H. (Utah Univ., Salt Lake City (USA). Dept. of Mining and Fuels Engineering). Jan 1983. Contract AC22-79ET14700. 115p. NTIS, PC A06/MF A01. Order Number DE83005696.

Projects reports are presented for the following tasks: (1) chemical-catalytic studies; (2) carbon-13 NMR investigations of coal derived liquids (CDL) and coal; (3) catalysis and mechanism of coal liquefaction; (4) momentum, heat, and mass transfer in cocurrent flow; (5) fundamental chemistry and mechanism of pyrolysis of bituminous coal; (6) catalytic hydrogenation of CD liquids and related polycyclic aromatic hydrocarbons; (7) denitrogenation and deoxygenation of CD liquids and related N- and O-compounds; (8) catalytic cracking of hydrogenated CD liquids and related hydrogenated compounds; (9) hydropyrolysis of CD liquids; (10) systematic structural-activity study of supported sulfide catalysts for coal liquids upgrading; (11) basic study of the effects of coke and poisons on the activity of upgrading catalysts; (12) diffusion of polyaromatic compounds in amorphous catalyst supports; and (13) catalyst research and development. Highlights for this period are: (1) tests for hydrodesulfurization (HDS) and hydrogenation activities of a number of catalysts carried out at both atmospheric and elevated pressure in the same reactor showed good correlation between low and high pressure results. This means that the atmospheric pressure tests adopted for ranking of activity of various catalysts should be the same under high pressure test conditions; and (2) enhancement of HDS activity of thiophene at levels of 2,6-dimethylpyridine adsorbed on a commercial CoMo/Al_2O_3 catalyst was confirmed in repeat experiments. This very unusual result (other N-compounds tested gave expected lowered HDS activity) indicates that adsorption on a site adjacent to the HDS site can activate the HDS site, provided that the HDS site is not itself blocked, e.g., by steric hindrance of the adsorbed molecule.

19431 **(DOE/FC—1011) Homogeneous catalysis of lignite liquefaction with hydrogen sulfide.** Baker, G.G.; Willson, W.G.; Farnum, B.W.; Stenberg, V.I. (Department of Energy, Grand Forks, ND (USA). Grand Forks Energy Technology Center; North Dakota Univ., Grand Forks (USA). Dept. of Chemistry). 1983. 37p. (CONF-830308—5). NTIS, PC A03/MF A01. Order Number DE83006946.

From American Institute of Chemical Engineers national meeting; Houston, TX, USA (27 Mar 1983).

Based on our tests to date we can summarize our thoughts on H_2S addition as follows: the incorporation of sulfur into distillable products is minimal and occurs as elemental sulfur and light organics. There are no apparent additional health hazards associated with hydrocarbon distillates produced with H_2S addition. Methylene bond cleavages of the type represented by diphenylmethane are initiated by elemental S with H_2S serving as an H-donor. Based on tubing bomb tests, H_2S does not catalyze liquefaction of lignite by H_2. As demonstrated in tubing bomb, autoclave and CPU experiments, H_2S catalyzes the reaction of lignite with CO and water, probably by promoting the water gas shift reaction. In bottoms recycle, added H_2S significantly lowers recycle slurry viscosity. Recycle product produced with added H_2S contains lower boiling distillates and enhanced levels of hydroaromatics. H_2S addition enables lignite liquefaction to be accomplished at temperatures significantly below those necessary for non-catalyzed reaction and thus has the potential to reduce H_2 consumption through decreased hydrocarbon gas production. 9 figures, 5 tables.

19432 (DOE/FE/05147—1371) Coal-gasification basic research and cost studies. Quarterly report No. 5. (McKee (Davy) Corp., Cleveland, OH (USA)). 14 Jan 1983. Contract AC21-81FE05147. 71p. NTIS, PC A04/MF A01. Order Number DE83007400.

Work was continued on basic research and cost studies supporting the Department of Energy's coal gasification program. Two major activities or tasks are being performed. The first activity (Task I) is the development of a process or processes to produce agglomerates from coal fines suitable for use as a feed to fixed-bed gasifiers. Seven US coals are being investigated. The second activity (Task II) is a design and cost study to examine the effects of gasifier selection on overall plant costs for a commercial-scale coal gasification facility. More than 100 pelletizing runs were performed during the quarter; these were in addition to the pelletizing runs made earlier. Like with briquettes, a large number of coal-binder compositions showed promise as a good gasifier feed material. Although, in general, the pellets were weaker than briquettes of similar compositions, many pellets displayed reasonably good strengths. The principal problem with pellets was their low green strengths. The strengths of pellets generally increased significantly upon drying and fell off only slightly during exposure to gasification temperatures. Of the binders examined, bentonite and gilsonite were found to be best. Task II work centered on: (1) bringing the original cost estimates for the proposed Erie Mining gasification plant up to date; and (2) designing a large briquetting facility, incorporating this facility into the Erie Mining plant designs, and developing cost estimates for the complete plant.

19433 (DOE/MC/14273—1325) Dynamic analysis of slurry letdown valves at H-Coal pilot plant. (Mechanical Technology, Inc., Latham, NY (USA)). Dec 1982. Contract AC21-80MC14273. 73p. NTIS (US Sales Only). Order Number DE83004680.

Mechanical Technology Incorporated (MTI) is under contract to provide technical services for the improvement of performance of critical equipment required in the coal conversion process plants. A key service required in these plants is the level control of the effluent separator of the reactor vessel where coal conversion process takes place. This function is usually served by discharge of the liquid phase slurry in the separator through valves commonly called letdown valves. A number of technical problems have been experienced with the slurry letdown valves in the pilot plant operations. These include: excessive wear rate of critical valve components as a result of erosion, corrosion, and flashing; breakage of valve trim as a result of excessive flow induced vibration (fatigue) and/or sudden high bending load; breakage of valve stem as a result of excessive structure vibration (fatigue) of valve body, actuator, and associated piping; and coking formation in the valve eventually causing plugging. An approach to providing engineering data necessary for the understanding and eventual reduction/elimination of these problems is vibration measurement and structural analysis, including design analysis of structural damping characteristics. MTI has performed the following analysis for the understanding of the basic vibration phenomenona of the slurry letdown valves and made actual vibration measurements of the letdown valves presently under operation at the H-Coal pilot plant: lateral natural frequency and mode shape calculations of the valve stems; axial natural frequency calculations of the stems including the actuators; and valve body natural frequency calculations, including calculations for nearby piping and supports.

19434 (DOE/MC/14731—1297) Review of in-bed hydrocarbon, alkali, and trace metals control in coal-conversion processes. Tamhankar, S.S.; Wen, C.Y. (West Virginia Univ., Morgantown (USA). Dept. of Chemical Engineering). Aug 1981. Contract AT21-81MC14731. 216p. NTIS, PC A10/MF A01. Order Number DE83006376.

The overall objective of this study was to identify and assess possible materials that can be added in or near the bed of advanced coal combustors or gasifiers for the control of emissions of hydrocarbons and alkali and trace metals. A major conclusion of the literature search conducted is that studies on the monitoring of the contaminants emission from operating combustors or gasifiers are extremely scarce. Some studies of this nature exist for alkali metals, but are nonexistent for trace metals. In the case of hydrocarbons, only one source of data is available, which is based on a laboratory scale fixed-bed reactor. Based on the limited data available from direct studies and the thermodynamic and physico-chemical data compiled in this report for probable sorvent materials, it appears that various silica-alumina compositions and some iron-containing materials show promise with respect to the control of alkali metals, trace metals and hydrocarbons. Some more specific materials identified are: clays and diatomaceous earth for alkali and trace metals, high surface area chars, sulfides of transition metals and iron for cracking hydrocarbons. Compounds of Mo, Pb, Hg and V, which are mostly toxic, are found to be captured by aluminosilicates, forming the corresponding alumino-silicate compounds. Some of the compounds of Mo, pb and fluorine occurring in a combustor or a gasifier can be adsorbed by using a bed of alumina maintained at high temperatures.

19435 (DOE/METC—82-51) Advanced gasification projects. Ghate, M.R.; Friggens, G.R. (eds.). (Department of Energy, Morgantown, WV (USA). Morgantown Energy Technology Center). Sep 1982. 219p. (CONF-8206141—). NTIS, PC A10/MF A01. Order Number DE83004848.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

The Second Annual Advanced Gasification Projects Contractors' Meeting Proceedings was sponsored by the US Department of Energy Morgantown Energy Technology Center, Morgantown, West Virginia, and held June 22-24, 1982, at Morgantown, West Virginia. Forty-four papers have been entered individually into EDB and ERA. (LTN)

19436 (DOE/METC—82-51, pp 3-7) **Studies of initial reaction steps in the gasification of coal and selected model compounds.** Margrave, J.L. (Rice Univ., Houston, TX). Sep 1982. NTIS, PC A10/MF A01. Contract FG22-81PC40792.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

The various experiments in this study were designed to produce data from reactors that simulate the early stages of coal gasification by bringing the coal quickly up to reaction temperature. Highly reactive gas phase intermediates exit rapidly from the reaction zone and are then deposited on a 10 K reflective surface where further reaction is rapidly quenched. The products, when isolated in a non-interactive solid such as nitrogen, argon, or even dry air, should exhibit well-defined spectra that allow the precise measurement of isotopic shifts and peak positions. Free radicals can be detected by characteristic infrared spectra or EPR spectra. The presence of a specific intermediate can also be monitored with a fast time response quadrupole mass spectrometer. The combination of mass spectrometric and matrix isolation infrared and EPR spectroscopic techniques serve as an effective probe for the existence of transient gaseous reaction intermediates.

19437 (DOE/METC—82-51, pp 20-23) **Kinetics of coal pyrolysis and gasification.** Walker, P.L. Jr. (Pennsylvania State Univ., University Park). Sep 1982. NTIS, PC A10/MF A01. Contract AC01-79ET14882.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

All aspects of the studies lead to enhanced fundamental understanding of gasification phenomena at ambient and elevated pressures of steam and syn-gas. It will provide significant information on kinetics, product yields, and structural changes of coals/chars brought about by these processes. Pyrolysis and gasfication studies in an atmospheric pressure entrained laminar flow reactor are being conducted on three coals (lignite, subbit C and bituminous) in order to examine early stages of gasification. Kinetics of weight loss are determined by an ash tracer technique. Data are to be taken as functions of coal particle size, temperature, and residence time. Effects such as preoxidation (for the bituminous coal) and level of exchangeable cations (for other coals) are to be examined. Methane Production During Pyrolysis and Gasification Microreactors are to be designed and constructed in order to study pyrolysis and gasification in steam of five coals at ambient and elevated pressures. The gaseous products (CH_4, CO_2, CO, and H_2) and tar evolution will be monitored continuously via NDR analyzers and optical density measurements, respectively. Reactions will be performed on chars with wet and dry H_2/CO (ratio 3:1) and mixtures of steam with H_2, CO, and N_2. The effect of added H_2S in gas stream will be examined. In addition to studying CH_4 formation from chars from two raw coals (lignite and bituminous), both coals will be doped with varying levels of potential catalysts (Ca, K, Na, and Fe) by ion-exchange (lignite) or impregnation prior to carbonization (bituminous). Formation of CH_4 via these reactions is to be followed by NDIR and TGA over a range of temperatures and pressures.

19438 (DOE/METC—82-51, pp 24-29) **Short residence time hydropyrolysis.** Sinisgalli, A.J. (Princeton Univ., NJ). Sep 1982. NTIS, PC A10/MF A01. Contract AC01-79ET13153.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

Previous work had established the general features of the yields to be expected from short residence time pyrolysis and hydropyrolysis. However, results from different labs using different reactors were difficult to reconcile because the heating rates and residence times intrinsic to the reactors were different. Consequently, the necessarily approximate models proposed could only be fitted to data from a specific reactor with a specific coal. In short, neither the experiments nor the models were sufficiently fundamental to be generally useful. Therefore, experimental studies were proposed with a new reactor system to (a) furnish kinetic data on pyrolysis and hydropyrolysis of several coals over a broad range of temperatures (600° to 1000°C), heating rates (10^2 to 10^4 K/s), particle sizes (50 to 500 μm), pressures (0 to 100 atm), gas atmospheres (pure He to pure H_2), and reaction times (0 to 500 ms) with various pretreatments and (b) develop kinetic models including effects of coal softening, mass transfer, and homogeneous gas phase reactions.

19439 (DOE/METC—82-51, pp 30-34) **Coal plasticity, agglomeration, and volatiles secondary reactions during gasification.** Howard, J.B. (Massachusetts Inst. of Tech., Cambridge). Sep 1982. NTIS, PC A10/MF A01.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

Previous MIT studies provided quantitative data on the effects of reaction conditions, coal type, native mineral matter, and inorganic additives on yields, composition, and rates of formation of products from the rapid pyrolysis and hydropyrolysis of coal. This work was intentionally focused on the initial decomposition (primary pyrolysis) of the coal. However, it revealed that full understanding of coal pyrolysis behavior demands better quantitative data and interpretive models of the post-pyrolysis reactions of freshly formed volatiles. It was also shown that inorganic additives such as calcite and lime modify gas and tar yields. The proposed research would involve measuring swelling, agglomeration, and viscosity of softening coal, and rates and extents of secondary reactions as a function of temperature, contact time, total pressure, composition of reactive atmosphere, and method and extent of treatment of coal with inorganic additives. Data on secondary reactions of fresh coal pyrolysis tars would be obtained using a versatile, two-zone packed bed tubular reactor system. This facility is in place and has already provided data on the rates and extents of homogeneous reactions of fresh coal pyrolysis tars. Special features of this facility include separation of tar generation reactions from tar secondary reactions; ability to achieve controlled and virtually immediate contacting of freshly generated coal pyrolysis tar with freshly generated pyrolysis char of well-known surface characteristics; independent variation of total pressure and volatiles residence time with good time resolution; isolation of contributions of fluid-solid and vapor-phase processes to the overall tar secondary reaction behavior, amenability to model compound experiments for mechanistic studies; and ability to decouple mass transfer from chemical kinetic effects.

19440 (DOE/METC—82-51, pp 35-38) **Effects of inorganics and pore structure on char gasification kinetics.** Perlmutter, D.D. (Univ. of Pennsylvania, Philadelphia). Sep 1982. NTIS, PC A10/MF A01. Contract AC21-81MC16117.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

The object of this research is to distinguish the contributions to overall kinetics that are related to the pore structure from those attributable to surface reaction chemistry. To this end, the proposed research will focus on three areas: (a) kinetics and porosity, (b) inorganic additives, and (c) data interpretation. A range of representative chars will be prepared by pyrolyzing coals under nitrogen using different heating rates and temperatures to obtain a series of chars with similar chemical composition but different pore structure. These chars will be reacted with oxygen and/or steam under various conditions of concentration and temperature to determine rates at different conversion levels. Depending on the particle size, experimental conditions will be selected to insure chemical kinetic control. A Thermogravimetric Analyzer (TGA) will be used to monitor the conversion and reaction rate with respect to time. The pore size distribution and the BET surface area of the reactant chars will be measured at each conversion level by mercury intrusion porosimetry and nitrogen adsorption, respectively. A major objective of this part of the research is to follow the changes of pore structure and reaction rate that occur during the course of reaction, and to correlate these changes with the initial pore structure of chars. This information will make it possible to determine the intrinsic reaction rate constant without the interference of structural parameters.

19441 (DOE/METC—82-51, pp 39-44) **Heterogeneous kinetics of coal gasification.** Calo, J.M. (Brown Univ., Providence, RI). Sep 1982. NTIS, PC A10/MF A01. Contract FG22-81PC40786.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

The rational design of coal gasifiers and gasification systems requires fundamental understanding of the physical and chemical phenomena heat occur during the conversion process. Also, just like many other chemical reactors, coal gasifiers are heterogeneous by nature; this always tends to complicate design and analysis because of the possibility of interphase and intraphase heat and mass transport resistance obfuscating the intrinsic chemical kinetics. In view of this situation, the primary objectives of the current project are to develop a fundamental description of the intrinsic chemical kinetics involved in coal-char gasification and to evaluate the role of heat and mass transport processes via experimental techniques specifically directed at controlling these processes. Gradientless operation allows determination of intrinsic kinetics because of minimization of external interphase heat and mass transport gradients. Transient techniques allow determination of characteristic reacion mechanisms. Rapid transient behavior is resolvable with supersonic, modulated molecular beam sampling. Measurements can be performed at realistic coal-char gasification conditions, i.e., 1400°F at 550 psi, and 3600 psi at 1000°F. Gas phase reactions can be differentiated from heterogeneous reactions by variation of the gas-to-solids ratio. The experimental system can be readily adapted to accommodate other diagnostic techniques, i.e., laser Raman and resonance fluorescence for gas phase reactions. The experimental system can be readily adapted to kinetic studies of other gas-solid, gas-liquid, or homogeneous gas phase systems of relevance to coal processing and fuels science. Automated control and data collection can provide the capability to investigate complex kinetic systems.

19442 (DOE/METC—82-51, pp 45-48) **Influence of changing particle structure on the rate of gas-solid gasification reactions.** Debelak, K.A. (Vanderbilt Univ., Nashville, TN). Sep 1982. NTIS, PC A10/MF A01. Contract AC21-81MC16053.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

Changes in structural parameters, such as surface area available for reaction, porosity, and pore size distribution, will markedly affect the rate of gas-solid reactions. Accompanying these changes in structural parameters are changes in the resistance to diffusion of gaseous products and reactants through the pores of the solid. A quantitative measure of the effect of pore diffusion is given by the particle's effectiveness factor. This is the ratio of the reaction rate, under diffusion controlled conditions, to that which would occur if the concentration of reactants were equal to the surface concentration. The effectiveness factor is a unique function of the particle's effective diffusivity. By measuring the changes of the solid structure and effective diffusivity with conversion of the solid and including their effect in an overall rate expression, a clear understanding of the nature of gas-solid reactions can be attained. Studies have been conducted in this area; however, few have made measurements of the changes in these parameters with solid conversion. Most studies mention that the changes in the solid affect the reaction rate and attempt to include parameters in the reaction rate model to account for them. The objective of this work is to determine the changes in the particle strucure of coal as it undergoes the reaction, $C + CO_2 \rightarrow CO$, and to include the effect of these changes in surface area and effective diffusivity on the overall reaction rate. This research will lead to a better understanding of coal gasification reactions.

19443 (DOE/METC—82-51, pp 49-51) **Coal reactivity.** Gardner, N. (Case Western Reserve Univ., Cleveland, OH). Sep 1982. NTIS, PC A10/MF A01.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

A novel means for obtaining thermogravimetric kinetic data has been developed, viz., the entire reactor plus contents are weighed during the course of a run. A 130 kg (300 lb) reactor with thin wall flexible gas lines and thermocouples attached is suspended from a large balance. The reactor has a sample capacity of 0.5 kg (1 lb). With all lines attached, the balance has a sensitivity of 0.2 g. Control over the fluid mechanical regime is therefore possible allowing elimination of external mass transfer effects, operation as a true differential bed reactor, and permitting measurement of meaningful product compositions. The kinetics of the devolatilization and gasification of non-caking coals will be measured in the temperature range 650° to 980°C (1200° to 1800°F) and pressures from atmospheric to 1500 psia. Gasification to CO_2, H_2O, H_2, and mixtures thereof will be performed. The kinetic measurements will be done in the continuously weighed thermogravimetric analyzer. Fluidized and fixed sample beds will be used. Product gas compositions will be determined. The specific surface area, pore volume distribution and morphology of the samples from Task 1 will be obtained as a function of total carbon conversion. The techniques of CO_2 adsorption, mercury porosimetry, scanning electron microscopy, and high voltage microscopy will be used.

19444 (DOE/METC—82-51, pp 52-55) **Research on the mechanisms of gasification reactions in the catalysis of coal, char, and other carbonaceous materials (catalytic gasification mechanisms).** Kosky, P.G. (General Electric Co., Schenectady, NY). Sep 1982. NTIS, PC A10/MF A01. Contract AC21-80MC14591.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

The gasification of coals proceeds by catalysis whether the catalysts are adventitious or added to promote desired reactions Catalysts are added to coals for several reasons - to promote faster reactions, to enhance selectivity of reactions, to foster in situ tar cracking, and to reduce swelling behavior. It is well known that certain salts of the alkali, alkaline earth, and transition metal groups have advantages as gasification catalysts for carbonaceous materials. The former are effective for CO_2 and steam gasification producing CO and H_2, while the transition metal group are active for direct hydrogenation of carbons to CH_4. This study focuses on the mechanisms of catalysis of coal by added salts during gasification. The term mechanisms refers to a determination of the elementary steps by which gasification is affected, the influence of adventitious coal minerals, and the process(es) by which coal/catalysis contact is established. The work includes determination of gasification kinetic parameters for a variety of coal chars under the influence of several catalysts present in varying degrees. The impact of this study will lead to an expanded understanding of gasification catalysis. In particular, elucidation of mechanistic aspects has the potential of leading to new concepts in catalysts - in the method by which they are dispersed, in the composition of desirable catalytic salts, or by simplifying their recovery from the residue coal ash.

19445 (DOE/METC—82-51, pp 56-59) **Investigation of coal gasification catalysis reaction mechanisms.** Trilling, C.A. (Rockwell International Corp., Canoga Park, CA). Sep 1982. NTIS, PC A10/MF A01. Contract AC21-80MC14592.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

Catalysts for coal char gasification reduce reaction time and plant capital costs and add material costs and complexity to process. Detalied knowledge of catalysis mechanisms will result in more efficient use of catalysts, reduced materials costs, gasification at lower temperature, and increased yield of higher valued products. Better understanding of catalysis can be achieved by application of broad spectrum of advanced analytical techniques and detailed correlation between the gasification rate and the physical and chemical changes in the char. The work was: determine gasification rates of coal char using: reactant gases (CO_2, H_2O, H_2, gas mixtures), catalysts (alkali metal carbonates, potassium salts, calcium oxide), and control chars without catalysts; analyze gases produced during gasification; use tagged compounds to determine origin of reaction products and catalyst role (D_2, D_2O, K_2CO_3-carbon-13); analyze partially gasified chars using broad range of instrumentation (NMR, EPR, XPS, FTIR); examine char physical strucure using SEM, BET; and develop mathematical models of reaction mechanisms consistent with experimental data.

19446 (DOE/METC—82-51, pp 60-63) **Catalytic gasification of coal char.** Wise, H. (SRI International, Menlo Park, CA). Sep 1982. NTIS, PC A10/MF A01. Contract AC21-80MC14593.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

In our experimental program to date, major emphasis has been placed on three experimental techniques to provide information on chemical pathways and intermediates in char gasification reactions: temperature programmed reaction; high-temperature Knudsen mass spectrometry; and in-situ electron spin resonance spectroscopy. Experimental tools have been selectively employed to examine the behavior of several catalyst salts in contact with a coal-derived char. An initial and essential step in the activation of coal char for gasification is an interaction between the catalyst and the carbon. This interaction is an interaction between the catalyst and the carbon. This interaction occurs at elevated temperatures at the boundary between the catalyst and char phases even in the absence of the gaseous reactants (CO_2 or H_2O) required for gasification. There is evidence, that in the case of K_2CO_3, the presence of H_2O, in an adsorbed state on the char or as a hydrate of the inorganic salt, converts the catalyst to KOH, which melts and spreads over the surface of the char as a liquid film. The composition of this liquid inorganic phase will be determined by a dynamic balance between a reducing process at the char interface and an oxidizing process on the surface in contact with the gaseous reactant, steam, or CO_2.

19447 (DOE/METC—82-51, pp 64-66) **Catalytic effects in coal gasification.** Granoff, B. (Sandia National Labs., Albuquerque, NM). Sep 1982. NTIS, PC A10/MF A01.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

It has been known for some time that various inorganic species have a catalytic effect on the gasification rates of carbon, graphite, and synthetic chars. Various studies have shown that the addition or removal of coal ash can significantly affect the gasification of coal. Naturally occurring minerals in coal have an effect on pyrolysis and gasification. In this work, the effect on coal hydrogasification of adding various iron containing minerals to a Pittsburgh seam coal was studied. The product gas composition was monitored during the hydrogasification process to see if the potential catalyst altered the product distribution. The physical effect of mineral addition was determined by measuring surface area and pore volume of chars formed from these samples. The hydrogen transfer activity of the pure iron minerals was measured through H_2/D_2 exchange experiments. The catalytic activity of various reducible iron containing minerals varied in the following order: $Fe_2O_3 > Fe_3O_4 > FeSO_4 > FeS_2 > FeO > Fe$. Previous work suggested that the catalytic activity of iron minerals was due to reduced iron dissociation of hydrogen. Presently results of experiments that measured the physical effect of the catalyst upon coal, the hydrogen transfer effect of the catalyst upon coal, and the hydrogen transfer activity of the pure-reduced minerals are being evaluated. The project will determine in detail the mechanism by which iron minerals enhance hydrogasification rates and evaluate high pressure TGA results to determine the catalytic effect of the iron containing minerals at process conditions.

19448 (DOE/METC—82-51, pp 67-71) **Temperature-time-reaction medium controlled hydropyrolysis.** Park, W.K. (Monsanto Research Corp., Miamisburg, OH). Sep 1982. NTIS, PC A10/MF A01. Contract AC04-76DP00053.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

The batch jet reactor consists of four functional sections: combustion, mixing, reaction, and quench; and it provides the required reaction conditions incorporating explosive heating, sonic jet mixing, short residence time, and aerodynamic quenching. Similarly, the flow jet reactor consists of the same four functional sections for the required fast heating, jet mixing, short residence time, and rapid quenching. The sequence of the process is to (1) generate a hyper-velocity, high temperature combustion gas from H_2 and O_2 at various mixtures, (2) inject pulverized coal streams into this hot jet in the nozzle, (3) promote fast turbulent flow with various reaction mediums in a short (6 to 18 inch) reaction section, and (4) rapidly quench products. The experimental findings obtained from the batch reactor study revealed that: coal particles can be rapidly mixed and heated to reaction temperatures within 1 ms; 20 to 90 percent conversion of coal to gaseous and liquid products can be achieved within 1 ms reaction time; and hydrocarbons (saturates and unsaturates, i.e., ethylene and acetylene) and synthesis gas can be produced in controlled reaction medium. Similarly, the feasibility of the UFR process concept has been proven with the flow reactor. The preliminary results obtained thus far show that: 20 to 80 percent conversion of coal in less than 5 ms can be achieved; production of hydrocarbons (saturates and unsaturates, i.e., ethylene and acetylene) and synthesis gas can be selectively controlled; and the temperature-time-reaction profile can easily be varied to identify some effects of operating parameters on the coal conversion scheme.

19449 (DOE/METC—82-51, pp 72-77) **Development of BEACON Technology.** Grossman, A.P. (TRW, Inc., Redondo Beach, CA). Sep 1982. NTIS, PC A10/MF A01. Contract FC21-80MC14400.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

BEACON stands for BTU Extraction And CONcentration. The process is based on the patented discovery that carbonaceous materials that are catalytically extracted from low heating value gases are extremely reactive with hydrogen or steam. The process being developed around this chemistry upgrades the low BTU producer gas derived from the partial oxidation of coal in two steps. The first step involves the deposition of carbon on the ferrous metal catalyst, which is then separated from the hot depleted fuel gas. The carbonaceous material is then reacted with either hydrogen or steam to produce methane in the second step of the process. The hot, depleted fuel gas is very efficiently utilized to produce cogenerated electric power. Production of SNG and combined-cycle electric power from low heating values fuels via the BEACON system is inherently more efficient than conventional systems producing these same products from coal-derived medium-BTU gas. Proof-of-principle testing and research in small, atmospheric pressure fixed-bed reactors provide a good data base in support of the process chemistry. Additional experiments in fixed, fluid, and entrained bed reactors at pressures up to 20 atmospheres provided additional global reaction rate data and led to selection of fluid-bed reactors as a preferred mode of operation. The carbon deposition reaction proceeds rapidly over several different types of catalysts at temperatures of 450° to 500°C. Reaction rates are relatively insensitive to pressure. New catalysts have been developed that exhibit excellent steam gasification activity and stability at temperatures as low as 550°C.

19450 (DOE/METC—82-51, pp 78-80) **Photoassisted electrolysis applied to coal gasification.** Kasner, E.E. (Univ. of New Mexico, Albuquerque). Sep 1982. NTIS, PC A10/MF A01. Contract AC21-81MC16377.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

While conventional coal gasification uses steam-carbon reactions to produce low BTU coal gas through a strongly endothermic reaction at very high temperatures (800° to 1000°C), the proposed method uses solar radiation to produce the desired gas mixture at low temperature. Holes generated at the n-type semiconductor electrode surface upon illumination oxidize coal to carbon oxides, whereas electrons carried through the external wire to the counter electrode (metal) reduce water to hydrogen. Conversely, electrons generated at the p-type semiconductors reduce water, while holes at the metal electrode oxidize coal. The net result is gasification of a coal slurry in water utilizing solar radiation energy. The reaction occurs at very low temperature. Solar radiation having lower energy than the band gap of semiconductor electrodes is also utilized to heat up the slurry, reducing activation energy and thus increasing photocurrents. Currently, experiments are being carried out at the n-SnO_2 thin film electrode; a significant amount of photocurrents is observed for coal oxidation upon illumination. This implies that oxidation currents of coal are indeed enhanced by illumination, and thus solar radiation energy can be used for coal gasification. Also, the oxidation mechanism of coal slurries have ben elucidated. Coal is oxidized catalytically by iron (III) leached out, and iron (II) produced in the process is reoxidized to iron (III) to complete a cycle. Advantages of this method of coal gasification include that (a) coal gasification is accomplished with the aid of solar radiation, (b) low temperature operation is possible, and (c) cleaner gas products are produced.

19451 (DOE/METC—82-51, pp 81-85) **Steam pyrolysis of coal for two-stage gasification.** Gannon, R.E. (Everett Research Lab., MA). Sep 1982. NTIS, PC A10/MF A01. Contract AC21-81FE05123.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

In a series of pyrolysis studies using a diverse assortment of heating techniques and devices, it was shown that up to 80 percent of the carbon in coal could be liberated as volatile matter in less than 100 milliseconds. The composition of the product depended on the ambient atmosphere. That is, if the pyrolysis was carried out in hydrogen, C_2H_2 and CH_4 were the main products; whereas if the ambient gas was steam, the products would be CO and H_2. While Avco was carrying out these experimental studies, a GRI report by the R.M. Parsons Company comparing gasification processes pointed out the potential benefits of steam pyrolysis in a two stage gasification process. At the time Avco had demonstrated extremely high yields by way of steam pyrolysis in a batch reactor. It remained then to demonstrate that the same high yields via steam pyrolysis could be obtained in a flow reactor. The present program is directed at developing a suitable flow reactor specifically designed to take advantage of flash pyrolysis in a steam environment. The advantage of steam pyrolysis is that it can lead to a process with higher gas yields and lower oxygen demands. It will also allow reactor designs that are a small fraction of the size of present units. Comparison of the equations for partial oxidation and steam pyrolysis shows that the yield of product gas is about 70 percent higher in the steam pyrolysis case. Although the steam pyrolysis reaction is endothermic, it can be shown that even for a heat balanced reaction providing only enough oxygen to drive the steam pyrolysis, that a 22 percent higher yield using 33 percent less oxygen can be realized if steam pyrolysis reactions are optimized. In addition to the operating advantages, use of the flash steam pyrolysis will also have a significant effect on capital costs as the reactors will be only a fraction of the size of present designs.

19452 (DOE/METC—82-51, pp 86-92) **Studies toward improved techniques for gasifying coal.** Graff, R.A.; LaCava, A.I.; Weinstein, H. (City College, New York, NY). Sep 1982. NTIS, PC A10/MF A01. Contract AC21-80MC14875.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

The aim is to provide an experimental basis for improving the economic attractiveness of coal gasification by the cogeneration of gaseous fuel and high market value, light liquid fuel through flash pyrolysis in steam and steam-hydrogen mixtures. Initial studies of steam pyrolysis carried out (under a previous DOE contract) with a flash tube reactor provided up to 68 percent carbon conversion of Illinois No. 6 coal to liquids in 50 atm of steam, 900°C, one second vapor residence time, and 2 minutes solids residence time. Yields of gases and liquids obtained from the flash pyrolysis of raw coal in steam and steam-hydrogen mixtures will be determined in laboratory scale equipment. Liquids will be fractionated using SESC and the fractions analyzed by elemental analysis, gas chromatography, mass spectrometry, HPLC as required to characterize the liquids. A reactor operating to 100 atm under pure steam from 500°C to 1000°C with 100 mg. ground coal, vapor residence times from 0.1 to 20 seconds, solid contact times up to 300 seconds will be constructed. An automatic SESC apparatus will be constructued. The results will be analyzed and optimum operating conditions projected for commercial operation. Liquid yields of 20 percent (carbon conversion) were observed at 890°C in 750 psia steam, 2 minute solid contact time, and 4 second vapor residence time. The mean molecular weight of liquid product decreases with increasing reaction temperature. Nitrogen content of liquid product decreases with increasing temperature. Temperature range 850° to 950°C is targeted as optimum for light liquids of low heteroatom content. The cost of gasification will be reduced by the simultaneous production of high-value liquid products. The process is more complex than gasification alone so process development will be required.

19453 (DOE/METC—82-51, pp 93-96) **Flash pyrolysis of coal with reactive and nonreactive gases.** Steinberg, M.; Fallon, P. (Brookhaven National Lab., Upton, NY). Sep 1982. NTIS, PC A10/MF A01.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

Although there is a considerable literature on pyrolysis, information on the flash pyrolysis of coal with various gases under comparative conditions is less consistent. A good deal of information has been developed in the program on the rapid hydrogenation or flash hydropyrolysis of coal. It has become well known that the rapid hydrogenation (flash hydropyrolysis) of coal at higher temperatures produces significantly higher yields of lighter hydrocarbon liquids and gases. Much information has become available from flash hydropyrolysis data developed at BNL that indicates dramatic increases in methane and ethane yields and in BTX and light liquid oil yields. The purpose of the present work is to conduct a systematic study to determine the physical and chemical effects of the rapid heat-up and reaction of coal with inert gases (He, N_2, and Ar) and with other reactive gases (CH_4, CO, CO_2, and H_2O) in an entrained flow reactor. The operating conditions can range from atmospheric to 270 atmospheres, temperatures from room to 1000°C, coal flow rates from 0.10 to 4 lbs/hr, and gas flow rates from 0 to 20 lbs/hr. The advantage of flash pyrolysis as a process tool is to obtain higher yields and more valuable products by a direct conversion technique. The thermodynamic efficiency of direct flash pyrolysis is higher than by indirect conversion, which involves producing CO and H_2 first and then catalytically correcting to products. There is a potential that coal flash pyrolysis can produce valuable liquids and gases and the char be utilized to produce power for the utilities. Many US utilities, oil companies, and chemical companies have shown interest in the data that is being produced. There is also interest in foreign countries.

19454 (DOE/METC—82-51, pp 100-108) **Coal gasification support studies.** Babu, S.P. (IGT, Chicago, IL). Sep 1982. NTIS, PC A10/MF A01. Contract AC21-80MC14705.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

The objective of this program is to advance coal gasification technology through a series of related studies that support the development of advanced coal gasification processes. These studies, involving both the analytical and experimental aspects of synfuels production, will contribute to fundamental understanding of reaction mechanism and pertinent unit operations, generate missing basic design data, and develop new processing techniques for direct application to overall processes. Several of these studies, including gasification kinetics, gas solids fluidization, and evaluation of shift catalysis were initiated with AGA/GRI support. Highly sophisticated experimental setups, having a replacement value of over $4 million, were made available to the ERDA/DOE program in April 1978. The initial DOE program addressed research in coal conversion reactions, fluidization, gas and effluent upgrading, and coal preparation. The scope of the present program is reduced to fluidization and gas and effluent cleaning and upgrading studies. Although much is known about commercially existing, first-generation processes, they can be made more efficient, reliable, and economical by the generation of new information. Coal conversion development beyond the first-generation technology involves temperature, pressure, and mode-of-contact variables, which are different enough from current commercial technology that new information on the fundamental reaction mechanisms and reactant contacting modes and new design and engineering data and processing techniques must be developed experimentally under conditions simulating actual plant operation. The present support studies have produced results that are widely applicable to high-BTU gasification, medium-BTU, and low-BTU gasification, synthesis gas production, fluidized-bed combustion, and coal liquefaction.

19455 (DOE/METC—82-51, pp 112-115) **Stochastic study of local fluctuations around the distributor in a fluidized-bed gasifier.** Fan, L.T. (Kansas State Univ., Manhattan). Sep 1982. NTIS, PC A10/MF A01. Contract AC21-81MC16310.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

The investigation involves the following four tasks: measuring local properties of the fluidized bed, including pressure, differential pressure, particle velocity, bed composition, bed capacitance and/or temperature around the distributor of the fluidized bed, and computing auto-correlation functions of their fluctuations, under steady-state and unsteady-state conditions; cross-correlating between any pair of fluctuating state variables, e.g., between pressure and particle velocity; modeling several stochastic features around the distributor of a fluidized bed, including temporal fluctuations and spatial variations of pressure, particle velocity, bed composition, bed density, and/or temperature; testing the feasibility of employing the techniques and models developed in this work as diagnostic tools for malfunctions of a fluidized-bed gasifier, especially its gas distributor, and for establishing static and dynamic control schemes for the gasifier. A substantial number of experimental data have been obtained. The data include the local voidage and local pressure and their fluctuations in a fluidized bed, especially around the distributor plate. The data have yielded some important information, such as the jet height variations, the bed density distribution, the bubbling frequency distribution, and the cause of the pressure fluctuations. The on-line measurement and data processing, using statistical correlation functions, have been found to be efficient with respect to computational effort and to give sufficiently accurate results; however, the costs for the required facilities are substantial, and furthermore, the data can be interpreted in a meaningful way by highly trained personnel.

19456 (DOE/METC—82-51, pp 116-120) **Hydrodynamical basis for scaling fluidization data on jet penetration and mixing relevant to fluidized-bed coal gasifiers.** Blake, T.R. (Univ. of Massachusetts, Amherst). Sep 1982. NTIS, PC A10/MF A01. Contract AC21-81MC16440.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

A major uncertainty in the design of fluidized-bed reactors for coal conversion is the applicability of existing hot or cold fluidization data to a new fluidization environment. Consequently, the modification of a current design, such as scale-up, or the development of new configuration either requires extensive experimental investigation or an uncertain extrapolation of the existing data base. With the possibility of major scale-up decisions regarding fluidized-bed gasifiers such as the Westinghouse Agglomerating Combustor/Gasifier and the Institute of Gas Technology U-Gas Gasifier, it is timely to review, compile, and correlate fluidization data relevant to such gasifier concepts. There are two major purposes to such research. The first is to examine and review fluidization data that are relevant to the environment of fluidized-bed coal gasification reactors. A particular emphasis will be placed upon jet penetration and bubble formation. The second purpose is to critically review existing correlations and, based upon theoretical models of fluidization, establish nondimensional parameters that can be used to scale fluidization data. In this theoretical study, models of gas fluidized beds using two-phase theories, continuum mixture theories, and discrete representations of the gas-solids flows will be examined, and nondimensional groups associated with these formulations will be applied in the correlation of the data. An additional benefit would be the assessment of theoretical models in providing a representation of fluidization phenomena. This is of considerable interest, since there is an increasing application of complex hydrodynamic models to study fluidization.

19457 (DOE/METC—82-51, pp 121-123) **Evaluation of mechanistic models for coal gasification.** Padhye, A.R. (West Virginia Univ., Morgantown). Sep 1982. NTIS, PC A10/MF A01.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

The prime objective of this contreact is to evaluate three computer simulation models of fluidizd-bed and entrained gasification ractors. The models to be tested are CHEMFLUB of System, Science and Software (SSS) and FLAG and FLAME of JAYCOR. The models are to be tested for the soundness of their mathematical basis and numerical methods, accuracy of coding, and appropriateness of the several constitutive relations used in the models. Also, the codes are to be exercised to simulate experimental situations and results. Presently, several computer codes based on first principle models for simulations of fluidized-bed and entrained gasifiers are under development. These codes stand at a stage where they are to be validated so as to identify merits and demerits of each of the models, and to formulate guidelines for their future developments. Exploratory work in this direction was conducted at West Virginia University under the sponsorship of METC. The present contract is for continuation of that work in a more rigorous fashion. There are three major physical aspects of a gasifier: hydrodynamics, heat transfer, and chemistry. This task will appraise the appropriateness of the mathematical formulations used for modeling these phenomena in various models.

19458 (DOE/METC—82-51, pp 124-126) **Fluidized-bed gasifier - systems model development.** Bloomfield, D. (Physical Sciences, Inc., Woburn, MA). Sep 1982. NTIS, PC A10/MF A01. Contract AC21-80MC14361.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

Using existing laboratory data PSI is developing the appropriate modifications to the PSI FBG code to make the model treat slugging beds accurately. PSI is also constructing the data tables that will be used by the systems model. PSI identified the parameters that are important for the slugging regime and is in the process of incorporating them into the PSI model. It is found that neither bubble size nor flow type in the emulsion phase have a significant effect on the char conversion. The parameter that does have an effect on conversion is the tranfer coefficient between bubble and emulsion phase. Slugging occurs when the ratio of bed height to bed diameter is large. Since this is the case for many gasifiers, modifying the present PSI FBG code to include slugging conditions has a great advantage. It can predict the behavior of gasifiers operating in slugging regime more accurately. In generating a systems model that is based on the output of the detailed model of the fluidized-bed gasifier, PSI will develop the capability of accurately assessing the operation of the gasifier in a systems environment. This is, perhaps, the most important feature of the program. It gives the systems designer a tool with which he can optimize the system configuration and component design. Because the systems model is based on the output of the detailed code, the analyst can have confidence that the operation of the gasifier in a systems environment is accuratly simulated.

19459 (DOE/METC—82-51, pp 127-130) **Prediction and measurement of operating parameters for entrained-flow coal gasification processes.** Smoot, L.D. (Brigham Young Univ., Provo, UT). Sep 1982. NTIS, PC A10/MF A01. Contract AC21-81MC16518.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

The laboratory-scale, entrained-coal gasifier was designed, constructed, and used to make atmospheric coal gasification measurements. Gasifier tests to determine optimum operating conditions and to obtain detailed maps of local gas and particle composition and mass flux data from inside the gasifier were completed. Variables investigated have included steam/oxygen/coal ratios, coal particle size, gasifier injector configuration, preheat temperature, secondary/primary mass flow, and velocity ratios and the partitioning of the O_2 between secondary and primary jets. One-dimensional and two-dimensional entrained-coal gasifier computer models were also completed, and model predictions were compared with laboratory measurements. Further, cold-flow jet mixing experiments were completed. These non-reactive jet mixing tests were designed to provide fluid property measurements to support model developmnt and validation. This study of details of physical and chemical processes taking place inside an entrained gasifier is thought to be unique. A well-equipped laboratory, a functional gasifier, a combined theoretical and experimental approach, a combined study of carbon conversion and pollutant formation, and a supporting cold flow study have been available and usd in the work. Also, the study has been closely associated with a companion EPRI contract for pulverized coal combustion, which has reduced the cost of cold flow tests and model development. Costs are further reduced through BYU cost sharing (13 percent). The results will provide a more compelte understanding of the physical and chemical processes involved in entrained coal gasification.

19460 (DOE/METC—82-51, pp 131-136) **Coal gasification reactions with on-line, in-situ FT-IR analysis.** Solomon, P.R. (Advanced Fuel Research, Inc., East Hartford, CT). Sep 1982. NTIS, PC A10/MF A01. Contract AC21-81FE05122.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

This work has developed an important understanding of the thermal decomposition of coal that was incorporated into a successful general kinetic model. The model allows the prediction of time- and temperature-dependent evolution of pyrolysis products from a knowledge of the coal's functional group distribution using a set of kinetic rate constants that are independent of coal rank. The current program will extend these results to coal pyrolysis under practical gasification conditions. Standard tests such as proximate analysis and free swelling index are of limited value since they are usually made under conditions much different from those encountered in an actual reactor. This program will obtain data in an entrained flow reactor under practial gasifier conditions and use the data to develop a general model for coal pyrolysis. The reactor has been designed to study coal behavior under temperature and heating rate conditions encountered in an entrained flow gasifier. After a variable residence time, the reacting stream passes optical access ports and is quenched immediately downstream in a water-cooled collector. The clean gas stream enters the room temperature FT-IR cell that provides a longer path length for higher sensitivity analysis.

19461 (DOE/METC—82-51, pp 137-138) **Theoretical and experimental studies of fixed-bed coal gasification reactors.** Joseph, B. (Washington Univ., St. Louis, MO). Sep 1982. NTIS, PC A10/MF A01. Contract FG22-80PC30219.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

The objective of this research is to develop mathematical models to describe the steady-state and dynamic behavior of fixed-bed coal gasification reactors. Under the previous grant, a computer program capable of predicting short-term and long-term transients in Lurgi-type gasifiers was developed and tested. However, it was not possible to fully validate the model using data available in the literature. Furthermore, it was necessary to incorporate a large number of simplifying assumptions in the model. The purpose of the current project is to partially remedy this situation. The key problem area in validating the model is to obtain reproducible, reliable data. A laboratory fixed-bed gasifier has been designed to accomplish this. Selected samples of coal will be gasified in a tubular reactor. The temperature profiles and the product gas composition will be monitored as a function of time. Preliminary runs will be concentrated on identifying key model parameters and verifying critical assumptions in the model. The existing dynamic model will be modified to simulate the experimental reactor. The model will be upgraded by removing some of the simplifying assumptions and incorporating short-term dynamic effects.

19462 (DOE/METC—82-51, pp 139-143) **Development of a process for the simultaneous high-temperature removal of alkali and particulates in pressurized gasification systems.** Mulik, P.R. (Westinghouse Electric Corp., Pittsburgh, PA). Sep 1982. NTIS, PC A10/MF A01. Contract AC21-81MC16372.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

Hot gas cleanup systems, if developed, have the potential to remove contaminants from the fuel gas without any significant cooling. As such, the heat rate improvement advantage for hot gas cleanup over cold gas cleanup is estimated to be about 500 to 600 BTU/kWh for combustion turbine inlet temperatures of about 2000° to 2200°F. At the same time, hot gas cleaning circumvents problems associated with heat recovery in coal cleaning systems. For example, constituents of the fuel gas, such as soot, ash, and other particulates, along with any tars that may be present, could produce deposits on heat exchange surfaces. In an operating system, the performance spread could be greater than the 500 to 600 BTU/kWh indicated above. The experimental and analytical investigations, preliminary systems design, and cost estimates completed under this program demonstrated the feasibility of utilizing aluminosilicate-basd getters for controlling alkali in pressurized gasification systems. On this basis, this work was extended to the current contract, facilitating the resolution of several questions raised during the completed program regarding alkali getter selection and application. The limited rate, capacity, and other problems (primarily potassium relase) associated with a number of getters tested initially have been cause for concern. While systems based on these getters are feasible, the economics associated with their implementation indicate that an improvement in alkali capacity is desirable. The results of preliminary screening and TGA tests on several new candidate getters are encouraging. They indicate a substantial improvement in capacity that, if verified in additional studies, will establish gettering via aluminosilicates as a viable hot gas cleaning process.

19463 (DOE/METC—82-51, pp 144-148) **Feasibility study of hypersorption process for separation of components of a medium-btu gas.** Saroff, L. (Dravo Engineers and Constructors, Pittsburgh, PA). Sep 1982. NTIS, PC A10/MF A01. Contract AC21-81MC16447.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

A general description of a hypersorption process is given. Activated carbon is fed to the top of the hypersorber through 12-inch dense phase transport lines. Four bins receive the activated carbon. Circulaton rates for the activated carbon are based on the rates and compositions of the expected bottom product assuming adsorption equilibrium of an ideal mixture. A recirculating top product gas stream is fed to the bins to cool the carbon to the adsorption temperature. Tower diameters are such that the gas velocity will not exceed 80 percent of the fluidization velocity. Desoprtion temperatures were chosen to leave approximately 10 percent of the bottom product on the adsorbent. Higher temperatures could be used to achieve a higher percentage of desorption of the gas adsorbed but would be less economical. Desorption is accomplished by establishing a recycle heat loop for the bottom product. Direct heating of the activated carbon serves as the desorption section of the hypersorber. This method of desorption is considered to be more economical than using heat exchanger with the towers to indirectly heat the activated carbon for desorption and to cool the adsorbent before entering th adsorption section. In general, total installed and operating cost of the hypersorption plant is higher than the cryogenic facility. These are not significant considering the nature of the cost study. However, the installed cost of the separation and purification of the cryogenic portion of the plant is greater than the hypersorbers. The economic evaluation does not present a clear cut test of which system is better. Further work on hypersorption processing for multicomponent system would be useful to eliminate the technological risks of applying hypersorption process technology.

19464 (DOE/METC—82-51, pp 149-153) **Low energy process for separating hydrogen and methane in advanced coal gasification processes.** Yang, R.T. (State Univ. of New York, Buffalo). Sep 1982. NTIS, PC A10/MF A01. Contract AC21-80MC14386.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

Two of the major and costly units of operation in the production of high-BTU gas from coal are separation of H_2 and CH_4 and cleanup of the acidic pollutants, i.e., about 1 percent H_2S is usually contained in coal gases. In the present designs, cryogenic separation and wet scrubbing processes are being contemplated. Besides their high energy requirements, the cryogenic processes are thought undesirable because a high purity of CH_4 is not required for high-BTU gas production. In this program, fixed-bed, cyclic processes are being developed for producing a fuel gas containing about 90 percent CH_4. The program is also aimed at the ambitious goal of developing a combined CH_4/H_2 separation and H_2S cleanup process. A complete data base of adsorption isotherms for the $CH_4/H_2/H_2S$ system (single and mixed gases) on activated carbon, Pittsburgh bituminous coal and coke, and Montana lignite and char, are being established. Separation of 50/50 CH_4/H_2 into 90/10 streams with a continuous feed has been routinely attained using PCB carbon and Montana char (lignite carbonized at 800°C in N_2), by temperature swing. The temperature levels are 22 and 180° to 1250°C. The pressure is in the range of 300 to 800 psig. A pore-diffusion model has been established that can (1) predict the performance of fixed-bed, cyclic separation processes and (2) be used as a guide in selecting the adsorbent. The cyclic fixed-bed separation process, using the coal sorbent developed in this work, would be a lower-cost process and require less energy than the present cryogenic processes. The combined separation/cleanup process could combine two process steps into one for advanced coal gasification.

19465 (DOE/METC—82-51, pp 154-157) **Calcium silicate cement sorbent for H_2S removal and improved coal gasification processes.** Steinberg, M. (Brookhaven National Lab., Upton, NY). Sep 1982. NTIS, PC A10/MF A01.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

In situ high temperature removal of H_2S and COS produced in fluidized-bed coal gasifier systems is a desirable objective in hot gas cleanup of fuel gases. Work performed with Agglomerated Cement Sorbent (ACS) in the laboratory established that this sorbent has good physical and chemical stability and capacity for SO_2 removal from hot combustion gas mixtures. The mechanism for H_2S absorption, like SO_2, can be expected to result in diffusion controlled kinetics with sorption capacity dependent on the porosity of the solid sorbent. In the case of Ca-based sorbents, such as Portland cement Type III (CaO content of 63.3 percent), the smaller molar volume of CaS in comparison with $CaSO_4$, can, at least in principle, lead to 100 percent utilization of the active ingredient. However, the practical consideration of the kinetic rate for H_2S removal determines the effective utilization limit for these sorbents. A literature review led to the conclusion that the first-order rate constant for H_2S or SO_2 removal are probably not very different. Both TGA and bench-scale experiments on sorbent reactivity for H_2S removal indicate that ACS pellets result in significant improvements in sulfur removal from fuel gases compared to Greer limestone. These ACS pellets can be made to any size and are much superior to limestone in resistance to attrition. TGA and bench-scale FBG tests also indicat that the sorbent can have a strong influence on the gasification efficiency of coal and coal char and that the ACS pellet is superior to Greer limestone in enhancing the gasification efficiency of coal. In addition to sulfur removal, the improved gasification of coal to fuel gas by a possible surface catalytic mechanism is a decided advantage over conventional operation of fluidized-bed gasifiers.

19466 (DOE/METC—82-51, pp 158-163) **Acid gas removal process.** Massey, L.G. (CNG Research Co., Cleveland, OH). Sep 1982. NTIS, PC A10/MF A01. Contract AC21-80MC14399.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

The crude fuel gas is first dehydrated and then cooled to its dew point. Further cooling to -55°C condenses carbon dioxide. The gas at -55°C is scrubbed clean of sulfur compounds and remaining trace contaminants with liquid carbon dioxide. Liquid carbon dioxide has several desirable properties as an absorbent: it absorbs COS more effectively than H_2S; its low viscosity promotes high absorber stage efficiency; it is a relatively dense fluid with low molecular weight that enhances gas solubility per unit volume of solvent; and it is available from the gas stream being treated. Liquid carbon dioxide absorbent, with sulfur compounds and other trace contaminants, is combined with the sulfur-contaminated liquid carbon dioxide stream, typically 3 to 5 mole percent hydrogen sulfide, is sent to the carbon dioxide regenerator. The sulfur-free gas leaves the sulfur absorber at essentially -55°C with carbon dioxide the only significant impurity yet to be removed. Pure carbon dioxide is regenerated by triple point crystallization in a continuous separation cascade similar to continuous distillation. Further carbon dioxide is removed from the main gas stream at temperatures below the carbon dioxide triple point temperature by absorption into a slurry consisting of a liquid solvent saturated with carbon dioxide and containing solid carbon dioxide. The preferred solvents for slurry absorption are oxygenated organic compounds such as ketones: they possess low freezing points, low viscosity when saturated with solid carbon dioxide, low vapor pressure, and high solubility for solid carbon dioxide.

19467 (DOE/METC—82-51, pp 164-166) **Thermal reactions of aromatics with CaO.** Longwell, J.P.; Williams, G.C.; Peters, W.A. (Massachusetts Inst. of Tech., Cambridge). Sep 1982. NTIS, PC A10/MF A01. Contract FG22-80PC30229.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

Previous research at MIT has shown that (a) fluidized-bed pyrolysis of coal in the presence of calcium oxide decreases absolute tar yields but generates tars of lower oxygen content and higher H/C ratio and also results in major desulfurizaton of the pyrolysis gas including removal of thiophenic compounds; (b) calcium oxide exhibits significant cracking activity for pure aromatic compounds such as benzene and for heteroatom-containing aromatics such as thiophene, pyrrole, and furan and accelerates the cracking rate of aromatics to a much greater extent than for aliphatic compounds; and (c) packed tube pyrolysis of coal in the presence of calcium oxide produces tars of significantly lower mutagenic potency than those obtained under similar conditions using sand. An improved reactor facility has been constructed and systematic studies of the effects of calcining conditions on CaO cracking activity for pure aromatics are well underway. Future work will focus on: (a) completion of the study of calcination chemistry to determine the effects of other calcining variables on the activity of CaO; (b) systematic studies of the effect of temperature on the conversion reactions of higher boiling polycyclic aromatic compounds over CaO and quartz; and (c) studies of the surface activity of CaO as a function of temperature and possibly methods of stone preparation.

19468 (DOE/METC—82-51, pp 168-171) **Coal gasification and tar conversion reactions over calcium oxide.** Longwell, J.P.; Peters, W.A. (Massachusetts Inst. of Tech., Cambridge). Sep 1982. NTIS, PC A10/MF A01. Contract AC21-81MC16026.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

Previous research at MIT has shown that (1) fluidized-bed pyrolysis of coal in the presence of calcium oxide rather than sand at 700 K-1033 K resulted in (a) major decarbonation of the product gas over the temperature range 700 K-923 K, (b) virtually total desulfurization of the product gas, (c) increased heating value per unit volume of product gas, (d) greater proportion of the coal heat content converted to pyrolysis gas, and (e) decreased absolute tar yields but product tars of higher H/C ratio and lower oxygen content (effects (c) to (e) apparently result from an unexpected ability of calcium oxide to augment the thermal cracking reactions of coal pyrolysis tars); (2) calcium oxide accelerates preferentially the cracking rate of pure aromatic compounds to a much greater extent than that of pure aliphatic compounds; and (3) exploratory experiments on packed bed pyrolysis of coal in the presence of calcium oxide produce tars of significantly reduced mutagenic potency to bacterial cells. Using a reactor system designed to allow the cracking of freshly formed coal pyrolysis tars over calcium oxide to be studied in a controlled, systematic fashion, the independent effects of temperature, pressure, gaseous atmosphere, and residence time on total conversion, product yields, compositions, and global formation kinetics will be studied over ranges pertinent to coal gasification. The experimental approach is based on controlling the extent of contacting of freshly formed pyrolysis tars with a packed bed of calcium oxide or other stone of well known calcination history and surface properties.

19469 (DOE/METC—82-51, pp 172-175) **Thermal and catalytic cracking of tars and tar constituents from coal gasification processes.** Wen, W.Y. (Clark Univ., Worcester, MA). Sep 1982. NTIS, PC A10/MF A01. Contract AC21-80MC14385.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

Tars produced by incomplete gasification of coal can account for as much as 6 weight percent of carbon on bituminous coal fed to fixed-bed gasifiers. These tars can cause fouling or corrosion of heat recuperators, lockhopper ball valves, and other surfaces; can interfere with wet chemical removal techniques for other contaminants; and can present a potential carcinogenic threat if released. When the raw gas is quenched, it yields an aqueous condensate stream saturated with aromatic compounds. In some cases it may contain emulsified tars and oils. The cost of equipment neccessary for treatment of the wastewater in a Lurgi high-BTU gasification plant is, at least, 8 percent of the total capital investment. Thermal cracking step is the key stage in elimination of tars from gasifier products. With proper design and operation of a gasifier, it should be possible to enhance thermal cracking of tars; the performance of many gasifiers would likely be improved when suitable catalysts are introduced. It was found that: tar cracking is insignificant at temperatures below 600°C; calcium oxide and fire bricks are relatively effective catalysts for tar cracking; chars also act as catalyst for tar cracking, though not as effective as calcium oxide or fire bricks; but clay minerals (aluminosilicates) generally considered to be catalysts for cracking reactions are not genuine catalysts; they function rather as steam and oxygen suppliers during the reaction.

19470 (DOE/METC—82-51, pp 176-180) **Pollution control in coal gasification.** McMichael, W.J. (Research Triangle Inst., Research Triangle Park, NC). Sep 1982. NTIS, PC A10/MF A01. Contract AC21-81MC16441.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

Temperature and pressure conditions of the raw gas and condensate produced in coal gasification make two processes look technically attractive for control of undesirable components. These processs are (a) vapor phase cracking of undersirable components prior to quenching the raw gas and (b) wet oxidation of the condensate. To investigate these control techniques, the Research Triangle Institute (RTI) carried out a preliminary experimental program. Cracking studies were performed in small benchscale equipment (microreactors), and the wet oxidation expriments were carried out in a continuous flow stirred tank reactor. The significant accomplishments to date include (a) construction of a high-pressure and temperature gas/solid/liquid mixing and reaction system for carrying out reactions at coal gasifier exit conditions, (b) demonstration of the inadequacy of using iron-containing catalysts and coal char (below 650°C) for vapor phase cracking, (c) demonstration of the potential of using sulfided cobalt molybdate catalysts for cracking of phenol under practical gasifier exit conditions, and (d) selection of the best commercial catalyst materials and coal chars for wet oxidation of actual gasifier wastewater. A successful vapor phase cracking process would have advantages over the traditional quench-then-treat approach since eliminating heavy organics from the raw gas at high temperature would reduce operational problems downstream of the gasifier, permit the recovery of high quality waste heat, and reduce the cost of condensate cleanup for reuse in the gasification process. Wet oxidation is currently usd as an industrial waste treatment method in a number of installations around the world and favorable conditions for its use can be obtained easily in gasification process.

19471 (DOE/METC—82-51, pp 186-187) **Operation of wastewater treatment PDU and PTPA 643 cooling tower simulation.** Willson, W. (Grand Forks Energy Tech. Center, ND). Sep 1982. NTIS, PC A10/MF A01.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

The Great Plains Gasification Association (GPGA) proposes to treat gasification wastewater minimally before disposal in a cooling tower. Pretreatment will consist of tar water separation, phenol extraction, and ammonia stripping. GPGA does not anticipate biological treating. According to American Natural Resources, sponsor of the GPGA project, the major area of uncertainty where research activities should be focused centers on the cooling tower. The extent of wastewater treatment needed to produce a satisfactory feed to the cooling tower is unknown, and the environmental and economic risks are substantial. Feeding water directly from the extraction/stripping units to the cooling tower, without intermediate biological treatment, is most cost effective. However, this wastewater after phenolics and other organics are reduced to low levels, still contains several thousand mg/1 of COD. The behavior of these as yet uncharacterized contaminants in a cooling tower with respect to drift, biological activity, and associated heat transfer surface fouling, is unknown. The use of a wastewater treatment system of sufficient size to prepare quantities of water for subsequent cooling tower studies has been obtained from the Environmental Protection Agency. The units, which were installed at the Holston Army Ammunition Plant in Kingsport, Tennessee, include solvent extraction, free- and fixed-leg ammonia stripping, and an aerated activated sludge unit. Wastewater pretreatment for preparing feed to the cooling tower during the initial test will consist of solvent extraction and free- and fixed-leg ammonia stripping. Sufficient wastewater will be prepared to ensure a minimum of 200 hours of cooling tower operation.

19472 **(DOE/METC/TPR—83-43) Hydrocarbon content of the vapor phase and light-oil fraction in the output stream of the METC gasifier.** Lamey, S.C.; Kovach, J.J.; Childers, E.E. (USDOE Morgantown Energy Technology Center, WV). Jan 1983. 26p. NTIS, PC A03/MF A01. Order Number DE83005868.

The higher molecular weight hydrocarbons contained in the clean low-Btu gas are primarily benzenes and naphthalenes with some furans and thiophenes. While analysis of the data shows that loadings range from 1-10 g/scm, the data are subject to variability introduced both in the process itself and in the sampling methods. Qualitatively, for the higher molecular weight hydrocarbons, collection on Tenax at atmospheric or gas stream pressure gives similar compounds, although the distribution is different. Comparison of the pressurized Tenax, atmospheric Tenax, and the drip leg sample shows a decreasing amount of lower molecular weight components. This is due primarily to the collection method. In the latter two samples the pressure reduction can result in the loss of the lighter weight hydrocarbons that could be retained in the pressurized sample. It appears that, qualitatively, typical compounds in the gasifier stream have been identified. Quantitatively, additional studies need to be conducted to evaluate Tenax as a collection medium for pressure applications including the pressure dependency of its collection efficiency. It does appear that the pressurized collection of material using Tenax and the subsequent analysis by capillary GC/MS and headspace gas chromatography of the collected samples is a viable approach to acquisition of base line data for in situ hydrocarbon measurement system development.

19473 **(DOE/NBM—3008234) On-line material balance for the 10-tpd SYNTHOIL PDU: software procedures.** Fuchs, W. (Energy Research and Development Administration, Pittsburgh, PA (USA). Pittsburgh Energy Research Center). [nd]. 66p. NTIS, PC A04/MF A01. Order Number DE83008234.

A proper evaluation of the SYNTHOIL PDU and its performance requires the accountability of all materials entering and leaving the system. This is also true for all forms of energy. Extensive procedures to establish mass and energy balances for the 10 TPD plant are being developed. These balances, in conjunction with the data acquisition and data logging system, will provide the major portion of the information needed for the evaluation of the process and of the plant operation. In addition, alarm conditions will be reported instantly, and a permanent record of the plant history and its operations will be maintained. This document describes the procedure for the on-line material balance and for the reporting routines. These programs are intended to run in parallel with all other computer function (e.g. data logging, alarm check, etc.). However, where applicable, data logs may be used for the material balance. On-line material balances are determined on a regular periodic basis (cycle time 1 to 2 hours), and one full run contain the balances of the total mass and of the components listed. The plant is divided into 10 subunits which can be balanced individually. These subunits are outlined by heavy dashed lines in Figure 2-1. The graphical representation of this system consists of 10 nodes (numbered 1 to 10) and 35 streams connecting the nodes with each other and with the outside world.

19474 **(DOE/OR/03054—9) SRC-I quarterly technical report, July-September 1982.** (International Coal Refining Co., Allentown, PA (USA)). Mar 1983. Contract AC05-78OR03054. 474p. NTIS, PC A20/MF A01. Order Number DE83007989.

Fourteen research studies conducted for the SRC-I coal liquefaction demonstration plant near Newman, Daviess County, Kentucky, have been entered individually into EDB and ERA. (LTN)

19475 (DOE/OR/03054—9, pp 1-24) **General-purpose transportation and storage simulator for the SRC-I Demonstration Plant.** Patnaude, L.G. (International Coal Refining Co., Allentown, PA); Valenzuela, C.A. Mar 1983. NTIS, PC A20/MF A01.

In SRC-I quarterly technical report, July-September 1982.

Designing some components of a new plant, such as the storage tanks, loading stations, and intra-plant rail systems, is difficult, but these areas are frequently the major source of problems after the plant becomes operational. The following factors hinder design: Storage and distribution are part of a complex system that handles incoming customer orders as well as delivery of end products. Interactions within the system are so diverse that simple analytical models cannot solve problems accurately. Frequently, components of such a system have been sized as if they were independent entities, which may not be the case. For example, storage tanks, sized by a project engineer, and a rail fleet of tank cars, sized by a distribution specialist, are not mutually exclusive entities; tank cars often serve as secondary storage. Many of the system variables may be stochastic, nonlinear, or time dependent. Under such conditions, mathematical analysis tends to break down. Consequently, design is usually based on rule-of-thumb predictions. Such generalized techniques may not work well for the plant system under study. Aware of these difficulties, ICRC decided that the size and complexity of the SRC-I plant warranted development of a simulation model. Human analysis of these interactions is impossible, but computer simulation can address numerous hypothetical situations and resolve problems during the design stage. ICRC and APCI have developed a computer simulation model of the SRC-I Demonstration Plant storage and transportation system. The model enables ICRC to analyze the demonstration plant as an integrated production, storage, and distribution system. Furthermore, the simulation is flexible, so a variety of experiments can be performed to analyze the effects of modifying selected design parameters, or to identify and resolve potential design problems.

19476 (DOE/OR/03054—9, pp 25-44) **Selection of process dynamic simulation software for control strategy analyses.** Fairchild, B.T. (International Coal Refining Co., Allentown, PA). Mar 1983. NTIS, PC A20/MF A01.

In SRC-I quarterly technical report, July-September 1982.

ICRC is searching for digital computer software that can be used as a tool in dynamic simulation investigations of control strategies for the SRC-I Demonstration Plant. This report traces the development of dynamic process simulators and identifies important features that must be evaluated during the selection process. Of several simulators identified, three that are in the public domain and two proprietary simulators available on a contract basis warrant further investigation. Thus far, steady-state process simulators have been evaluated; Schmidt et al. (1982) concluded that the Advanced System for Process Engineering (ASPEN) should be upgraded to provide a suitable simulator for the SRC-I plant. Progress in selecting a dynamic simulator is less well-developed. Dynamic simulation of process plants has several aspects that, in combination, set this type of modeling apart from studies in other areas of science and engineering. Process plants have many unit operations that are coupled through process piping, stream recycles, heat integration, and control loops. The process streams may contain multiple chemical components. Common equipment such as unit operations, process piping circuits, and control systems are often replicated within a process plant. Although certain features are the same for both steady-state and dynamic simulation of a chemical process, the key feature of a dynamic simulation program is its ability to track plant variables throughout operational transients. Certain features, some of which are unavailable in general-purpose CSSLs, are grouped together to create general-purpose process dynamic simulators that are especially convenient for use by chemical process engineers.

19477 (DOE/OR/03054—9, pp 45-62) **Laboratory examination of the suitability of three US coal samples or Gesellschaft fuer Kohle-Technologie (GKT) gasification.** Firnhaber, B. (Gesellschaft fuer Kohle-Technologie, Essen, Germany). Mar 1983. NTIS, PC A20/MF A01.

In SRC-I quarterly technical report, July-September 1982.

ICRC has licensed the GKT coal gasification process for gasifying coal liquefaction residue and producing hydrogen. Supplemental coal will be gasified in addition to the liquefaction residue. Therefore, to assess the suitability of various coals as potential feedstocks to the gasifier, ICRC sent three samples of Eastern US bituminous coals to GKT for laboratory analysis. Two of the coals, Indiana No. 3 and Illinois No. 6, appear well-suited for entrained-bed gasification. They have high volatile contents, good reactivity, and favorable ash properties. The third coal, Ohio No. 6A, also contains many volatiles, but appears to be less suitable because its ash has a high base-to-acid ratio due to the coal's high iron content. However, in spite of this drawback, the Ohio coal can probably be used for blending with other coals or liquefaction residues, since its ash content is very low (6.5 wt % moisture-free).

19478 (DOE/OR/03054—9, pp 63-71) **Baseline flare system design for the SRC-I demonstration plant.** Gunardson, H.H.; Dluzniewski, J.H. (International Coal Refining Co., Allentown, PA). Mar 1983. NTIS, PC A20/MF A01.

In SRC-I quarterly technical report, July-September 1982.

The SRC-I flare system is primarily a safety system capable of relieving the non-steady-state accumulation of material within process equipment and of disposing it safely and efficiently to ensure the protection of life and property. The system is sized to handle the amount of material that must be released under the worst combination of anticipated emergency conditions. The flare system is also capable of safety disposing material released during less serious emergencies, including localized equipment failures and operating errors, and during start-ups and shutdowns. In all emergency situations, the principal purpose of the system is to rapidly release vapor generated within the process equipment in order to prevent the buildup of excessive pressure that would lead to catastrophic equipment failure. Even during start-up and shutdown venting, which occurs under planned, controlled conditions, the primary objective is to control pressure within the process. Controlling environmental impact is an important secondary function included in the flare system design. Each time material is released to the flare, it must be either recovered for reprocessing or disposed of in an environmentally acceptable manner. However, distinguishing between the flare system and pollution control equipment is important. The flare system is first and foremost a safety system, designed to prevent catastrophic equipment failure. In addition, the best available control technology has been incorporated to minimize environmental impact during its operation. The system is designed for maximum destruction of objectionable material during localized emergencies and start-up and shutdown (up to about 20% of maximum flare capacity). During major plantwide emergencies that occur less frequently, the level of destruction achieved is still acceptable.

19479 (DOE/OR/03054—9, pp 73-225) **SRC-I high-pressure slurry letdown system study.** Mar 1983. NTIS, PC A20/MF A01.

In SRC-I quarterly technical report, July-September 1982.

The pressure letdown of high-temperature slurries is one of the major problems in coal conversion processes. The Phase 0 design of the SRC-I Demonstration Plant high-pressure letdown system consisted of a single vessel with parallel letdown valves. In February 1981, growing concerns during design led to the issuance of an engineering change proposal, which modified this design to a two-train system. This led to further concerns, and in February 1982, Catalytic, Inc. was directed to perform a detailed study of the slurry letdown system. Catalytic considered six configurations of the high-pressure slurry letdown system, including single- and two-stage letdown, and single- and multi-train designs. A data base on letdown valve design was developed, and these data were incorporated into the design of the various configurations. To assess these designs, Catalytic considered operability, maintainability, and reliability, as well as capital and operating costs. Although the overall economics appeared to favor the tree-train, single-stage scheme, the equally important constraint that capital cost be minimized whenever possible led to the choice of the two-train, single-stage scheme, which is the current design. However, it was recommended that provisions be made for the future addition of a third train, should that be proven appropriate. For future study, areas of concern include valve design details and materials of construction, which cannot be specified at this time, as well as vessel inlet geometry, pressure magnitude, and use of wear-resistant liners in the flash drum.

19480 (DOE/OR/03054—9, pp 227-243) **Solvent screening experiments for SRC-I phenol recovery.** Luthy, R.G. (Carnegie-Mellon Univ., Pittsburgh, PA). Mar 1983. NTIS, PC A20/MF A01.

In SRC-I quarterly technical report, July-September 1982.

This report summarizes the results of a series of tests that assessed the solvent extraction characteristics of SRC-I process wastewater. The tests were designed to evaluate extraction characteristics of three solvents used on SRC-I wastewater, to determine whether phenols can be recovered effectively, and to provide information for evaluating the economic feasibility of phenol recovery. The preliminary results reported here suggest that two important issues must be resolved: the effect of pH on solvent extraction and the fate of tar acids during extraction. Nonetheless, the data strongly indicate that solvent extraction is an attractive treatment process for SRC wastewater. Phenolics can be extracted easily from the range of 8000 to about 50 mg/L. TOC can be reduced to one-third of its initial value, and aniline and pyridine can be reduced to less than 1 mg/L. The reduction in TOC and COD that can be achieved by solvent extraction should allow for an approximately proportional decrease in the hydraulic detention time required for biological oxidation of SRC process wastewater (that is, about one-third to one-half of that required to treat nonextracted condensate). In addition, as long as tar acids or other inhibitory substances are removed by solvent extraction, operating a primary biological oxidation reactor in the powdered activated carbon mode may not be necessary. Additional tests are needed to quantitate the degree to which tar acids are removed by extraction at various pH values.

19481 (DOE/OR/03054—9, pp 245-281) **Summary and analysis of SRC-I biological treatent data.** Novak, R.A. (International Coal Refining Co., Allentown, PA). Mar 1983. NTIS, PC A20/MF A01.

In SRC-I quarterly technical report, July-September 1982.

ICRC used the QWIKSTAT statistical package on the Air Products and Chemicals, Inc. (APCI) computer to summarize and analyze biological treatment data obtained during wastewater characterization and treatability studies. The operational data on the two biological and two PACT units were taken between February 26 and June 18, 1982, during which low-phosphate, high-salt wastewater feed was used. Statistical analyses revealed that, excepting a small difference in BOD, the single-basin PACT performs significantly better than does the two-basin biological system. Lower residuals and higher percent removals are achieved. Most significant are improved nitrification and complete ammonia removal in a single basin

19482 (DOE/OR/03054—9, pp 283-300) **Measuring alkenes in SRC-I naphthas.** Parees, D.M. (Air Products and Chemicals, Inc., Allentown, PA). Mar 1983. NTIS, PC A20/MF A01.

In SRC-I quarterly technical report, July-September 1982.

A naphtha sample from the first-stage SRC unit (SRC naphtha) was analyzed for alkene content using capillary column gas chromatography/flame ionization detection (GC/FID) by employing bromination to differentiate alkenes from other compound types, particularly cycloalkanes. Results showed that phenols and nitrogen-containing species are also brominated, and that these reactions interfere with olefin identification. However, despite problems with the method, approximate concentration ranges can be determined. A phenol-free SRC naphtha sample was found to contain about 10.9% alkenes, implying that the original naphtha from which it was derived contained 7.6% alkenes, since the sample weight decreased about 30% after phenol removal. After bases were removed from the sample, however, the alkene concentration fell to 6.1%; this value may be more accurate and indicates that other heteroatomic species are causing interference. The GC/FID results agree well with results from the classical American Society for Testing and Materials (ASTM) paraffin/olefin/naphthene/aromatic (PONA) technique, which indicates the presence of about 7 wt % olefins. Nuclear magnetic resonance spectrometry suffers from interference problems, also, but indicates that the original sample contains about 4.2% alkenes.

19483 (DOE/OR/03054—9, pp 301-348) **SRC-I Demonstration Plant analytical laboratory.** Parees, D.M.; Kamzelski, A.Z. (Air Products and Chemicals, Inc., Allentown, PA). Mar 1983. NTIS, PC A20/MF A01.

In SRC-I quarterly technical report, July-September 1982.

Air Products is conducting a research program to aid in developing the analytical laboratory of the SRC-I Demonstration Plant. New gas chromatographic capillary columns and optimized conditions were investigated to increase compound resolution, decrease compound discrimination in the injection port, and achieve maximum precision of injection. The effects of different columns and chromatographs on response factors and area integration precision, as well as the effects of sample matrix on retention times were examined. Although changes in retention time due to the use of different columns or chromatographs might be expected, changes caused by the matrix were not. Such changes complicate the task of assigning peak identities without mass spectrometry. The response factor studies showed that fused silica columns perform as well as glass capillary columns. Area integration precision was also found to be equal for two integrators if the same column and chromatograph were used. A Chaney adapter on the syringe did improve precision. An SRC-I heavy distillate was examined using a flame ionization detector (FID) and a nitrogen selective detector (NSD). A nitrogen-compound subfraction was also examined by FID, NSD, and gas chromatography/mass spectrometry (GC/MS). The analyses determined some of the major nitrogen-containing compound classes in this subfraction to be benzoquinolines, alkylbenzoquinolines, azafluoranthenes (or azapyrenes), and alkylazafluoranthenes.

19484 (DOE/OR/03054—9, pp 349-393) **Microanalytical procedures.** Klusaritz, M.L.; Moyer, J.D.; Palopoli, S.F.; Tewari, K.C. (Air Products and Chemicals, Inc., Allentown, PA). Mar 1983. NTIS, PC A20/MF A01.

In SRC-I quarterly technical report, July-September 1982.

Effective demonstration plant operation will rely on accurate monitoring of process streams to provide data for process and product quality control, particularly during plant start-up. To ensure that the plant's analytical laboratory will be operating smoothly, various analytical methods are being evaluated and developed. This report discusses microanalytical procedures selected by APCI to determine chlorine in solvent-refined coal (SRC) liquids, sulfur in hydrotreated naphtha, nitrogen in hydrotreated naphtha and SRC-I distillates, and pentane-insoluble matter in SRC solids. Researchers found that the Dohrmann microcoulometric titration system is a reliable and fast procedure for measuring both chlorine and sulfur. However, the Dohrmann system does not provide reliable results for nitrogen; instead, chemiluminescent analysis with an Antek instrument is recommended. A modified version of American Society for Testing Materials (ASTM) method D2317-76 that used pentane rather than toluene and benzene to extract oils was selected for analyzing SRC solids. This report also documents the capsule injection gas chromatographic simulated distillation (SDGC) technique developed by APCI to analyze SRC materials, plus the results of an evaluation of the methods's precision. The reproducibility of residue determinations was found to be 1.6 to 2.1% absolute, and data on boiling-point distribution showed that a cut point can be defined within the range of 0.1 to 1.2% absolute.

19485 (DOE/OR/03054—9, pp 395-419) **LC-Finer catalyst testing.** Garg, D. (International Coal Refining Co., Allentown, PA). Mar 1983. NTIS, PC A20/MF A01.

In SRC-I quarterly technical report, July-September 1982.

ICRC is conducting an ongoing program to develop data that will confirm the choice of Shell 324 nickel-molybdenum (Ni-Mo) catalyst for use in the LC-FINER in the SRC-I Demonstration Plant. The catalyst's activity and aging were studied during hydroprocessing of heavy solvent-refined coal (HSRC) and process solvent from the hydrotreater in a process development unit (PDU). To determine how SRC conversion and catalyst activity varied with time, a constant temperature of 775°F was maintained throughout the PDU run. During the first 25 hr, SRC conversion was 43 to 48% and desulfurization, dinitrogenation, and deoxygenation were 82, 48, and 68%, respectively. SRC conversion, oils production, SRC sulfur content, desulfurization, denitrogenation, deoxygenation, and the first-order rate constant for SRC conversion changed only slightly during the first 294 hr but changed significantly after that. Oils and hydrocarbon gas production varied linearly with SRC convrsion up to about 55% SRC conversion, beyond which oils production leveled off and hydrocarbon gas production increased exponentially. Hydrogen consumption, however, varied linearly with SRC conversion regardless of the conversion level. Analysis of spent catalyst revealed that its surface area and pore volume and diameter were reduced significantly and that an unusually high level of sodium (4.2%) was deposited on the catalyst, probably due to a high sodium level in the feed.

19486 (DOE/OR/03054—9, pp 423-438) **20-mesh vs 200-mesh coal study.** Mar 1983. NTIS, PC A20/MF A01.

In SRC-I quarterly technical report, July-September 1982.

Although the Phase 0 design specified a coal particle size of 90% through a 20-mesh sieve, DOE and ICRC directed Rust Engineering to conduct a study to evaluate the effect on equipment and capital investment of changing the particle size to 70% through a 200-mesh sieve. The investigation was limited to equipment and systems in the receiving and pulverization area. Rust concluded that the Phase 0 equipment, with minimal changes, could grind the specified coal to 70% through 200-mesh fineness. The primary change is an increase in the mill drive motor horsepower, and other small changes are expected in the auxiliaries. An estimated capital cost increase of $1 million is expected along with an operating cost increase of $506,720 per operating year for the two equipment trains selected.

19487 (DOE/OR/03054—9, pp 439-454) **20-mesh coal system study.** Mar 1983. NTIS, PC A20/MF A01.

In SRC-I quarterly technical report, July-September 1982.

Following submission of the SRC-I Phase 0 report to the Department of Energy in July 1979, ICRC requested an evaluation of the coal-processing, -grinding, and -transferring systems and equipment for the coal preparation area. Rust Engineering conducted the study, using data and designs developed in Phase 0. Of three dry-type coal-grinding devices studied (an air-swept tumbling-ball mill, roller race or bowl mill, and an air-swept hammer or impact mill), the tumbling-ball mill is recommended, based on the system's operability and reliability. Three systems for transferring crushed coal to the bunkers were evaluated: belt conveying, pneumatic transfer, and bucket-elevator transfer. Rust concluded that the bucket elevator system selected for Phase 0 could not be further optimized. The analyses were based on mechanical laws and grinding theories because tests have not been run on actual coal samples.

19488 (DOE/OR/03054—9, pp 455-466) **Comparison of two methods for cooling synthesis gas produced during gasification.** Mar 1983. NTIS, PC A20/MF A01.

In SRC-I quarterly technical report, July-September 1982.

In the Phase 0 SRC-I design, makeup hydrogen is provided by processing a synthesis gas that is generated by Texaco gasification of a mixture of Kentucky No. 9 coal and mineral ash residue (MAR) from filter deashing. Because the synthesis gas is hot, the Phase 0 design includes a water-quenching system to cool the gas before it is further processed. ICRC questioned whether the heat lost during gas quenching could be economically recovered. As a result, Parsons compared the economics of the Phase 0 design with those of an alternative design, in which the waste heat is used to generate high-pressure steam in a boiler system; the steam is then superheated for either export or electric power generation. Parsons determined that the original quenching system design is more feasible economically and is more reliable to operate than an alternative waste heat boiler system.

19489 (DOE/OR/20807—T1-Vol.1A) Tri-State Synfuels Project Review: Volume 1A. Executive summary and overall project review. (Tri-State Synfuels Co., Houston, TX (USA)). Jun 1982. Contract FC05-81OR20807. 408p. NTIS, PC A18/MF A01. Order Number DE83007440.

The Tri-State coal to gasoline project finally resulted from an initial Lurgigasification and Fischer-Tropsch syntheses to produce liquid fuels. As a result of changes, resulting partly from the analysis results, partly from changes in world energy price forecasts, and partly from the national administration change, the goals were changed during the work. Finally, a process resulted which seemed to have little technical risk, but which would result in higher gasoline costs than could be obtained from western coal; but there was difficulty in obtaining partners and uncertainty in getting financing or financial incentives from the US government. The history of the work is reviewed. The process advantages, contracts, licences and agreements, environmental effects, coal supplies (Kentucky) and coal testing. Tri-State believed that continued investment of substantial monies in the project could not be justified in light of: the present uncertainties of obtaining adequate financing of the plant investment; of our inability to acquire additional partners, given currently projected energy prices and continuing uncertainties surrounding the nature and ultimate amount of financig; and of government support for the planned facility. Tri-state further proposed to initiate project demobilization immediately to be completed by mid-June 1982. We expressed to SFC that in our opinion the nucleus of a synfuels industry is still a critical strategic US need and that Tri-State should be a part of that nucleus. We also encouraged SFC to investigate the project through third parties we had dealth with, such as other government agencies and potential partners who had reviewed the project.

19490 (DOE/OR/20807—T1-Vol.1B) Tri-State Synfuels Project Review: Volume 1B. Executive summary and overall project review. (Tri-State Synfuels Co., Houston, TX (USA)). Jun 1982. Contract FC05-81OR20807. 411p. NTIS, PC A18/MF A01. Order Number DE83007454.

The following subjects relating to the proposed coal to gasoline plant at Henderson, Kentucky, are considered in Volume 1B: water requirements and water supply and site selection and land purchase, permit applications, economic analysis (including process alternatives), financing (including considerations on submission to Synthetic Fuel Corporation for financial aid), market and marketing research for main products and by-products (including price forecasts and use in fuels of nonsaleable by-products), community relations, evaluating possible partners in the project, and a short discussion of engineering effort. (LTN)

19491 (DOE/OR/20807—T1-Vol.1C) Tri-State Synfuels Project Review: Volume 1C. Executive summary and overall project review. (Tri-State Synfuels Co., Houston, TX (USA)). Jun 1982. Contract FC05-81OR20807. 516p. NTIS, PC A22/MF A01. Order Number DE83007441.

Volume 1C consists of a bibliographic list of reports relating to the project, meetings and interoffice correspondence involving planning, community relations, etc. Some short sections involve engineering, proprietary processes or equipment, or environmental effects. (LTN)

19492 (DOE/OR/20807—T1-Vol.2A) Tri-State Synfuels Project Commercial Scale Coal Test: Volume 2A. Collection and shipment mine, barge, ship and train programs. (Tri-State Synfuels Co., Houston, TX (USA)). Jun 1982. Contract FC05-81OR20807. 268p. NTIS, PC A12/MF A01. Order Number DE83007443.

This report covers the collection of Camp 1 coal at the mine in Morganfield, Kentucky and shipment of the sample to Sasolburg, Republic of South Africa from February through April 1981. The collection and shipment phase covers the inspection, sampling, preparation and analytical testwork on coal quality and size for the mine, barge, ship and train programs. The samples tested were taken at the following locations: Morganfield and Uniontown, Kentucky; Darrow, Louisiana; and Port Elizabeth and Sasolburg, Republic of South Africa. The analytical program involved complete sieve and physical/chemical characterization of the total sample and coarse and fine fractions, including ASTM and RCRA leaching tests. The coal was dry screened at 1/4-inch round hole size to simulate gasifier feed quality and boiler feed quality. The analytical testwork results are covered in a companion report (Volume 2B) while an assessment of fines utilization is reported in Volume 4. A representative portion of the shipment coal was taken to build up a 200-ton stockpile simulating dead storage at Uniontown for purposes of monthly oxidation or weathering and leaching tests for one year duration.

19493 (DOE/OR/20807—T1-Vol.2B) Tri-State Synfuels Project Commercial Scale Coal Test: Volume 2B. Collection and shipment analytical testwork. (Tri-State Synfuels Co., Houston, TX (USA)). Jun 1982. Contract FC05-81OR20807. 281p. NTIS, PC A13/MF A01. Order Number DE83007442.

This report covers the detailed analytical testwork conducted for control purposes during the collection and shipment phase as well as the results obtained by Lurgi and other parties on the composite barge sample. These tests were conducted to ensure quality control at every step during the shipment, obtain fines generation data during rehandling and establish a chemical and physical characterization of the coal for testing and design purposes. Lurgi concluded from the laboratory results that the Camp 1 coal is suitable feedstock for the Lurgi pressure gasification process. This confirms their early statements during the selection phase as reported in Volume 1. Lurgi reported that the ash melting characteristics under oxidizing conditions indicated a short ash which means that the steam/oxygen ratio will have to be controlled carefully. The chlorine content is significantly higher than most coals and the gasifier, but not the downstream equipment, must be fited with protective cladding. The Kentucky Department of Energy coal shipment examination report provides a confirmation of the ASTM standard data; in addition, analyses for macerals, microlithotypes, reflectances and anisotropy are given. The crushed, run-of-mine, oversize material which required more operating attention at Sasolburg was investigated as to source and characteristics. Specimens collected at Sasolburg and from the Kentucky stockpile were examined as reported in Section 7.2.

19494 (DOE/OR/20807—T1-Vol.2-Summ.) Tri-State Synfuels Project Review: Volume 2. Engineering and process summary. (Tri-State Synfuels Co., Houston, TX (USA)). Jun 1982. Contract FC05-81OR20807. 41p. NTIS, PC A03/MF A01. Order Number DE83007438.

The purpose of this report is to document and summarize activities associated with engineering and process design efforts on the Tri-State Synfuels Project. The proposed facility was to be a coal-to-transport fuels facility located in Henderson, Kentucky. Tri-State Synfuels Company was participating in the project as a partner of the US Department of Energy per terms of a Cooperative Agreement resulting from DOE's synfuels' program solicitation. Fluor's initial work plan called for preliminary engineering and procurement services to the point of commitment for construction for a Sasol Fischer-Tropsch plant. Overall project schedule was estimated at 24 months with an estimated value of approximately $27 MM. During the course of the project, the plant design was changed, and at the time of project suspension was based on a reduced size facility to produce MTG gasoline. Included in this volume are discussions describing the overall history of the project, its definition, evolution, and major issues addressed during its execution.

19495 **(DOE/OR/20807—T1-Vol.3) Tri-State Synfuels Project Review: Volume 3. Process evaluation, selection and design.** (Tri-State Synfuels Co., Houston, TX (USA)). Jun 1982. Contract FC05-81OR20807. 423p. NTIS, PC A19/MF A01. Order Number DE83007449.

Volume 3 consists of a very detailed comparative evaluation of the available unit operation processes (usually proprietary) that are available for such an involved plant. Something like 100 individual processes are involved in the plant and the engineering and process selection is quite involved and sometimes involves several agreements. Many of the available processes, which of course involved some hundreds, are described reasonably and the reasons for the selection given briefly. (LTN)

19496 **(DOE/OR/20807—T1-Vol.3A) Tri-State Synfuels Project Commercial Scale Coal Test: Volume 3A. Gasification test at Sasolburg, overview.** (Tri-State Synfuels Co., Houston, TX (USA)). Jun 1982. Contract FC05-81OR20807. 91p. NTIS, PC A05/MF A01. Order Number DE83007447.

The SASOL test was conducted in order to confirm the operability of the Lurgi process with Western Kentucky coal and determine the preliminary design basis for the Tri-State Synfuels Project. The test plan was structured to optimize design parameters of both the gasification and associated plants and their component units by: demonstrating the need for additional gasifiers over the 36 estimated in the feasibility study; determining the steam requirement, which was about 6% higher than for the feasibility study; confirming the oxygen requirement estimated for the feasibility study; confirming design and performance of the distributor/stirrer to be satisfactory for Illinois Basin type coal; confirming that moderately swelling and strongly caking Illinois Basin coals can be gasified in a Mark IV gasifier fitted with a distributor/stirrer when using a non-caking coal for start-up; determining coal handling and preparation should provide a proper size and minimize fines generation and reject rock material to provide a constant specific gravity coal to gasifier. Confirming that dusty tar injection is feasible up to certain limits and that all the tar injected is gasified; determining that no oil is produced directly from the gasifier; determining that no shift unit is required to adjust the hydrogen-to-carbon monoxide ratio to that required for the input to the Fischer-Tropsch Synthol Units; determining a required increase in frequency of monitoring and quality control measures; and determining that direct use of stripped gas liquor for plant cooling purposes is not practical nor economical due to the excessively high chloride levels.

19497 **(DOE/OR/20807—T1-Vol.4) Tri-state synfuels project commercial scale coal test. Volume 4. Coal fines utilization in furnace boilers.** (Kentucky Dept. of Energy, Lexington (USA)). Jun 1982. Contract FC05-81OR20807. 41p. NTIS, PC A03/MF A01. Order Number DE83007450.

This report focuses on the technical feasibility of coal fines utilization as a boiler fuel in both cyclone and pulverized fuel furnace boilers. The fines examined were representative of the fine fraction of the Camp 1 coal shipment to Republic of South Africa for the commercial scale gasification test. The Camp 1 coal has also been selected as the Tri-State Synfuels design coal and as such the sample had to be characterized both for gasification (coarse fraction) use as well as boiler (fine fraction) use, not only for in-plant steam and power but also for export to nearly potential users. Paul Weir concluded that the Camp 1 raw fines or washed fines are suitable as a potential fuel source in cyclone (wet bottom) and pulverized (dry bottom) furnaces. Several exampes of nearby utilities with the proper combustion equipment were offered. Paul Weir also identified several provisions that should be considered for the design of the storage, handling and transportation systems for the fine coal due to the ability of the coal to retain moisture. These provisions include adequate drainage, covered storage and transport facilities.

19498 **(DOE/OR/20807—T1-Vol.4A) Tri-State Synfuels Project Review: Volume 4A. Design engineering.** (Tri-State Synfuels Co., Houston, TX (USA)). Jun 1982. Contract FC05-81OR20807. 331p. NTIS, PC A15/MF A01. Order Number DE83007452.

19499 **(DOE/OR/20807—T1-Vol.4B) Tri-State Synfuels Project Review: Volume 4B. Design engineering.** (Tri-State Synfuels Co., Houston, TX (USA)). Jun 1982. Contract FC05-81OR20807. 136p. NTIS, PC A07/MF A01. Order Number DE83007451.

Volume 4B contains a general discussion of environmental pollution control and general plant mechanical engineering: air pollution control (sulfur compounds, nitrogen oxides, particulates, carbon monoxide and hydrocarbon (spills and vapor losses)); emission (at start-up and small vent disposals); solid waste management (ashes, fly ash, sludges, spent catalysts, etc.); liquid effluents (runoff, blowdown, waste water, sanitary wastes); hydrocarbon vapors from tanks (including proceedures for purging and ventilating tanks for safety). This mechanical-engineering work was accomplished by the several Fluor operations: including the engineering of all mechanical equipment, such as compressors, turbines, blowers and pumps; heat exchangers, furnaces, heaters, cooling towers and cooling systems; material handling systems; pressure vessesl and tanks; fire protection systems; and associated metallurgical and welding engineering. Specific areas of involvement included the development of narrative specifications for mechanical engineering systems and equipment, the preliminary design of the coal and ash handling systems for the plant and the general support of all engineering disciplines with regard to mechanical engineering items.

19500 **(DOE/OR/20807—T1-Vol.5(Commercial)) Tri-State Synfuels Project Commercial Scale Coal Test: Volume 5. Kentucky stockpile tests.** (Tri-State Synfuels Co., Houston, TX (USA)). Jun 1982. Contract FC05-81OR20807. 320p. NTIS, PC A14/MF A01. Order Number DE83007446.

This report focuses on the compacted coal stockpile built at Uniontown, Kentucky with a 200-ton sample representative of Camp 1 coal shipped to Sasolburg, Republic of South Africa. This stockpile program had several objectives: obtain information on the changes in quality of coal over a period of one year resulting from weatering and leaching. The weathering of coal may affect the physical and chemical properties, the gasification characteristics and oxygen consumption); obtain chemical composition of rainwater leached through the pile and collected over a period of one year to assist in the environmental design of water collection system; and demonstrate construction of a stockpile that is safe from spontaneous ignition. Conclusions and design recommendationa for the long term storage of compacted coal resulted from the program. Recommendations of interest include oxidation and weathering stability, minimal leaching due to rainwater, limited impact on gasification characteristics and effective method to minimize spontaneous ignition. The tests conducted on the compacted stockpile (Section 3.0) provided observations over the one-year period on spontaneous ignition, surface and weathering, oxidation as measured by chemical, physical and gasification property changes, size degradation, acid runoff, pH of rainwater and leachate and extent of leaching. Texas Gas was responsible for constructing, maintaining and collecting site data at the stockpile (Section 4.1.1). Paul Weir Company was responsible for sampling, screening, analytical testing program and the leaching program for the stockpile over regular intervals of one to two months (Section 4.2.1). Lurgi was requested to analyze samples (Section 4.2.2) corresponding to the samples analyzed by Commercial Testing and Engineering and report on the influence of weathering on the gasification characteristics.

19501 **(DOE/OR/20807—T1-Vol.6) Tri-State Synfuels Project Review: Volume 6. Environmental, health, safety and socioeconomic review.** (Tri-State Synfuels Co., Houston, TX (USA)). Jun 1982. Contract FC05-81OR20807. 702p. NTIS, PC A99/MF A01. Order Number DE83007539.

Volume 6 includes: site selection (National screening: Powder River Basin, San Juan Basin, Illinois Basin, East Texas lignite belt, and North Dakota-Montana lignite belt; regional screening - 12 sites in Kentucky); environmental and socio-economic factors; land use; solid waste management; beneath and safety management; regulatory review; permit applications; meteorology; local government; transportation facilities, etc. Some of the surveys were quite detailed. (LTN)

19502 (DOE/OR/20807—T1-Vol.6A) Tri-State Synfuels Project Commercial Scale Coal Test: Volume 6A. Export sample program/wastewater treatability study summary report. (Tri-State Synfuels Co., Houston, TX (USA)). Nov 1982. Contract FC05-81OR20807. 177p. NTIS, PC A09/MF A01. Order Number DE83007445.

The following can be concluded from the research conducted on the treatment of Lurgi process wastewaters from the sample sent to Sasol: Biooxidation of pretreated gas liquors and synthesized Mobil MTG process wastewater components as feasible and a high degree of treatment efficiency could be attained when the process was controlled by optimizing the growth of thiocyanate bacteria. Sludge settleability was satisfactory. Partial removal of complexed cyanide was consistently maintained during steady-state operation of the bioreactor, probably by sorption on the biofloc. Seed sludges from a coke oven activated sludge process can be successfully used to develop biocultures for the treatment of Lurgi process wastewaters. GAC treatment was effective for the removal of residual organic carbon and chemical oxygen demand from bioreactor treated effluents. Untreated gas liquor was extremely toxic to fathead minnows at effluent concentrations of only five percent (19 parts water to one part gas liquor). However, bioreactor effluent showed a greatly reduced toxicity, with significant mortalities between 40 and 60 percent (approximately one part water to one part effluent). Treatment with granular activated carbon (GAC) reduced toxicity to negligible levels, even with relatively high unionized ammonia levels present in the effluent. No toxic effects were observed with GAC effluents when the pH was adjusted to reduce unionized ammonia levels. Bioassay test results demonstrated that the treated effluents after activated carbon adsorption would be relatively nontoxic to fathead minnows. Biological wastewater treatment facilities installed to meet BPT for Lurgi wastewater should provide sufficient removal of most toxic organic pollutants which would be designated as BAT.

19503 (DOE/OR/20807—T1-Vol.7) Tri-State Synfuels Project Review: Volume 7. Permitting, environmental impact statement and related environmental information. (Tri-State Synfuels Co., Houston, TX (USA)). Jun 1982. Contract FC05-81OR20807. 332p. NTIS, PC A15/MF A01. Order Number DE83007433.

Volume 7 begins with the plan for getting all the required permit applications. It continues with the preparation of the Environmental Impact Statement - US EPA has been designated as the lead federal agency. The treatment of plant waste waters is considered and, especially, the disposal of hazardous and waste materials. Pipeline routes for gasoline and natural gas were developed in coordination with Texas Eastern Transmission Corporation and Texas Gas Transmission Corporation. Coal conveyor and coal barge routes are considered briefly. (LTN)

19504 (DOE/OR/20807—T1-Vol.8) Tri-State Synfuels Project Review: Volume 8. Commercial status of licensed process units. (Tri-State Synfuels Co., Houston, TX (USA)). Jun 1982. Contract FC05-81OR20807. 79p. NTIS, PC A06/MF A01. Order Number DE83007434.

This document demonstrates the commercial status of the process units to be used in the Tri-State Synfuels Project at Henderson, Kentucky. The basic design philosophy as established in October, 1979, was to use the commercial SASOL II/III plants as a basis. This was changed in January 1982 to a plant configuration to produce gasoline via a methanol and methanol to gasoline process. To accomplish this change the Synthol, Oil workup and Chemical Workup Units were eliminated and replaced by Methanol Synthesis and Methanol to Gasoline Units. Certain other changes to optimize the Lurgi liquids processing eliminated the Tar Distillation and Naphtha Hydrotreater Units which were replaced by the Partial Oxidation Unit. The coals to be gasified are moderately caking which necessitates the installation of stirring mechanism in the Lurgi Dry Bottom gasifier. This work is in the demonstration phase. Process licenses either have been obtained or must be obtained for a number of processes to be used in the plant. The commercial nature of these processes is discussed in detail in the tabbed sections of this document. In many cases there is a list of commercial installations at which the licensed equipment is used.

19505 (DOE/OR/20807—T1-Vol.9A) Tri-State Synfuels Project Review: Volume 9A. Subcontract information. (Tri-State Synfuels Co., Houston, TX (USA)). Jun 1982. Contract FC05-81OR20807. 639p. NTIS, PC A99/MF A01. Order Number DE83007431.

Volume 9A considers subcontract work done at the site involving hydrogeological studies with respect to water supply and geotechnical work with respect to the building foundations necessary based on boreholes drilled and the lithology of the area. (LTN)

19506 (DOE/OR/20807—T1-Vol.9B) Tri-State Synfuels Project Review: Volume 9B. Subcontract information. (Tri-State Synfuels Co., Houston, TX (USA)). Jun 1982. Contract FC05-81OR20807. 300p. NTIS, PC A13/MF A01. Order Number DE83007478.

It is recommended that Fluor engage an Aerial Photographing and Mapping consultant to photograph and provide contour maps for the proposed site. The work shall include, but not be limited to, the following activities: (1) ground control surveys necessary to produce maps of such accuracy as specified; (2) aerial stereo photography and photo index map as necessary to produce the required contour maps; (3) contour maps of the site as defined in the contract (i.e. 1 inch = 40 feet scale with 2 foot contour interval, and oriented to Plant North); (4) photomosaic of the entire site and adjacent land; (5) digitalized data for direct input to Fluor's computer program to compute cut and fill earth quantities. It is recommended that Fluor solicit proposals from a minimum of four consultants. Based upon a technical and commercial evaluation of proposals Fluor would write a unit price/lump sum price contract for professional services with a guaranteed maximum clause. Volume 9B includes the maps obtained by the subcontract.

19507 (DOE/OR/20807—T1-Vol.10) Tri-State Synfuels Project Review: Volume 10. Narrative specification. (Tri-State Synfuels Co., Houston, TX (USA)). Jun 1982. Contract FC05-81OR20807. 966p. NTIS, PC A99/MF A01. Order Number DE83007455.

The Drawing - Specification schedule of Issue Record (DSSR) lists all specifications planned for the Tri-State Synfuels project. Specifications that have been issued Approved for Construction (AFC) are included in Section 2.0 of this volume. The status and location of specifications in process can be found in Volume 12, Section 8.0. Detailed specifications are given for major nonproprietary equipment items.

19508 (DOE/OR/20807—T1-Vol.11A) Tri-State Synfuels Project Review: Volume 11A. Engineering and processing alternatives. (Tri-State Synfuels Co., Houston, TX (USA)). Jun 1982. Contract FC05-81OR20807. 437p. NTIS, PC A19/MF A01. Order Number DE83007479.

A number of feasibility studies and process alternatives are evaluated. There are 41 titles but significant work has been done on a much smaller number which can be inferred from the indexing. (LTN)

19509 (DOE/OR/20807—T1-Vol.11B) Tri-State Synfuels Project Review: Volume 11B. Process development studies. (Tri-State Synfuels Co., Houston, TX (USA)). Jun 1982. Contract FC05-81OR20807. 300p. NTIS, PC A13/MF A01. Order Number DE83007432.

During the course of the Tri-State/Fluor Management Meeting held in Irvine on October 1, 1981, Fluor was requested to prepare additional process alternate studies. Discussions held on October 2 resulted in the definition of the eight cases described in this report. The scope for these eight cases were reviewed and approved during a meeting held in Houston on October 12. During the October 12 meeting Tri-State requested the preparation of an additional four cases reflecting the use of a typical Powder River basin coal. Cases 9 thru 12 issued with Revision 1 of this report reflect results of this work.

19510 **(DOE/OR/20807—T1-Vol.11C) Tri-State Synfuels Project Review: Volume 11C. Cost reduction studies.** (Tri-State Synfuels Co., Houston, TX (USA)). Jun 1982. Contract FC05-81OR20807. 280p. NTIS, PC A13/MF A01. Order Number DE83007480.

Volume 11C involves the evaluation of several process alternatives, including some variation in the product slate, cost verification studies, cost reduction studies and other miscellaneous engineering studies. At the Tri-State Management Review Meeting of November 5, 1981, it was pointed out by Tri-State that substantial improvement in the calculated return on investment figures would be necessary to make any of the proposed cases economically attractive. A special investigative team was organized to review all aspects of the current plant cost estimate with the objective of defining and evaluating all areas where project economics could be improved by reducing investment or operating cost or by improving the project income stream. In addition, other specific items to be investigated were defined by the Tri-State Irvine Team. A list of areas to be examined was developed and is included here as Exhibit 1-1 at the end of this section. The results of all studies are summarized in Section 1.2 with detailed back-up provided in subsequent tabbed sections. Summaries outlining the configuration and basic assumptions for the various case studies are given in Table 1-1. Table 1-2 indicates cost data for the case studies while Table 1-3 gives results of the cost verification and cost improvement analyses.

19511 **(DOE/OR/20807—T1-Vol.12) Tri-State Synfuels Project Review: Volume 12. Fluor project status.** (Tri-State Synfuels Co., Houston, TX (USA)). Jun 1982. Contract FC05-81OR20807. 427p. NTIS, PC A19/MF A01. Order Number DE83007435.

The purpose of this report is to document and summarize activities associated with Fluor's efforts on the Tri-State Synfuels Project. The proposed facility was to be coal-to-transport fuels facility located in Henderson, Kentucky. Tri-State Synfuels Company was participating in the project as a partner of the US Department of Energy per terms of a Cooperative Agreement resulting from DOE's synfuel's program solicitation. Fluor's initial work plan called for preliminary engineering and procurement services to the point of commitment for construction for a Sasol Fischer-Tropsch plant. Work proceeded as planned until October 1981 when results of alternative coal-to-methanol studies revealed the economic disadvantage of the Synthol design for US markets. A number of alternative process studies followed to determine the best process configuration. In January 1982 Tri-State officially announced a change from Synthol to a Methanol to Gasoline (MTG) design basis. Further evaluation and cost estimates for the MTG facility eventually led to the conclusion that, given the depressed economic outlook for alternative fuels development, the project should be terminated. Official announcement of cancellation was made on April 13, 1982. At the time of project cancellation, Fluor had completed significant portions of the preliminary engineering effort. Included in this report are descriptions and summaries of Fluor's work during this project. In addition location of key project data and materials is identified and status reports for each operation are presented.

19512 **(DOE/OR/20807—T1-Vol.14) Tri-State Synfuels Project Review: Volume 14. Commercial scale coal test.** (Tri-State Synfuels Co., Houston, TX (USA)). Jun 1982. Contract FC05-81OR20807. 166p. NTIS, PC A08/MF A01. Order Number DE83007477.

This report focuses on the overall program consisting of planning, implementing and supervising the activities surrounding the commercial scale gasification test of Camp 1 coal in the Lurgi Mark IV gasifier at the Sasol One Plant in Sasolburg, Republic of South Africa. The overall program was conducted to provide the design and environmental criteria bases for the Tri-State Synfuels Project, a venture of Tri-State Synfuels Company. The work involved the following individual programs: Selection of Calmp 1 coal. Collection and Shipment, Gasification Test at Sasolburg, Coal Fines utilization in Furnace Boilers, Kentucky Stockpile Tests, Export Sample Program, and Wastewater Treatability Study. Each individual program is reported in detail in Commercial Scale Coal Test, Volumes 1 through 6. Supplementary work on the sampling and testing program for run-of-mine Illinois Basin coals has been reviewed in the Tri-State Synfuels Project Review Report, Volume 13, Coal Sampling and Testing, June 1982. The contents of this volume were revised in NOvember 1982 to take into account the completion of the export sample program and the wastewater treatability study. The export sample program had been interrupted by the demobilization activities but has now been completed. The wastewater treatability study was commenced prior to demobilization. However, due to the lengthy nature of the program, the study was only recent completed. The expeirmental results of both studies and design recommendations and conclusions are included in this volume.

19513 **(DOE/PC/30027—35) Recycle-slurry-oil characterization. Quarterly report, April 1, 1982-June 30, 1982.** Burke, F.P.; Winschel, R.A. (Conoco, Inc., Library, PA (USA). Coal Research Div.). Mar 1983. Contract AC22-80PC30027. 55p. NTIS, PC A04/MF A01. Order Number DE83008324.

A series of thrigy-three coal/oil agglomerations experiments and subsequent analyses and testing provided much information on the use of this process for the pretreatment of coal liquefaction feeds. Coal derived oils were identified that will deash Burning Star coal (10% ash) by coal/oil agglomeration. The results indicate that it is possible to achieve 45% ash removal with 96% recovery of organic matter and product size larger than 1 mm. Acceptable oils included recycle oils produced by the ITSL, H-Coal and SRC-II processes. Under donor liquefaction conditions, the deashed coal gave conversions and yield structures similar to the raw coal. The ash elements Ti, Fe, K, Mg and P are selectively retained in the product. The ash elements Ca, Al and S are selectively rejected. The pyrite/ash ratio and the percentage of Fe_2O_3 in the ash are both increased in the product by approximately 1.5 times relative to the feed coal. This result should prove beneficial to processes such as SRC-II that rely on mineral matter catalysis because overall feed ash levels could be reduced while maintaining high concentrations of catalytic iron-bearing minerals. The cleaned coal is expected to give better hydro-liquefaction behavior than raw coal with similar ash levels. It may be possible to further enrich the iron in the ash by using run-of-mine coal. The donor liquefaction behavior of several foreign and domestic coals (candidates for ITSL) were tested in the microautoclave with ITSL pasting solvents at a variety of conditions. Yield structures were determined for some of the runs. Preliminary analyses are presented for the samples from the early Illinois 6 coal ITSL runs. 1 figure, 32 tables.

19514 **(DOE/PC/30088—11) Coal-transformation chemistry. Eleventh quarterly progress report.** Stock, L.M. (Chicago Univ., IL (USA)). 1982. Contract AC22-80PC30088. 47p. NTIS, PC A03/MF A01. Order Number DE83007532.

The effort on donor solvent coal chemistry was centered on the role of pericyclic reactions in the liquefaction process. The product distribution in the thermal decomposition of 9-(3-phenylpropyl)phenanthrene has been examined at 400°C in tetralin. This compound was selected for study because elementary considerations suggest that decomposition by a retroene reaction should be much more favorable in this case than in any other case thus far examined in this laboratory or elsewhere. The results indicate that free radical processes dominate the product-forming reactions of this compound. The nature of alkyl ethers formed in the reductive alkylation of coal has continued to be investigated. Through means of selective dealkylation-realkylation of aryl methyl ethers in the tetrahydrofuran soluble ^{13}C-enriched reductively methylated coal and in the ^{2}H-enriched reductively perdeuterio-methylated coal, it has been determined that CoalCHROCD_3 molecules are present. Such secondary alkyl methyl ethers have not been previously identified in the products of reductive alkylation. Although the quantitative assessment of the abundance of these materials has not yet been completed, the observations suggest that about 10% of the oxygen atoms in this Illinois No. 6 coal occur in secondary hydroxy groups.

19515 (DOE/PC/40785—6) **Exploratory study of coal-conversion chemistry. Quarterly report No. 6, August 19, 1982-November 18, 1982.** Ross, D.S.; McMillen, D.F.; Fleming, R.H.; Hum, G.P.; Mansani, R.; Green, T.K. (SRI International, Menlo Park, CA (USA)). 1982. Contract AC22-81PC40785. 46p. NTIS, PC A03/MF A01. Order Number DE83005408.

Initial experiments combining compound-class (HPLC) separation of coal liquefaction products and field ionization mass spectrometric (FIMS) analysis of the various fractions to obtain improved correlations between donor-solvent structure and coal-conversion effectiveness have been performed. These experiments have used a very low-fluidity bituminous coal (PSOC-1116, Sunnyside, Utah) and tetralin and 1,2,3,4-tetrahydroquinoline (THQ) as donor solvents. Apart from indicating ways in which the chromatography procedure needs to be adjusted to achieve better separation on the basis of functional groups (compound-class separation), FIMS analysis of the various fractions has allowed us to conclude that the observed THQ incorporation (a 100%) is comprised less than 2% physical or hydrogen bonded incorporation, less than 30% by self-polymerization reactions of THQ, and at least 70% by covalent incorporation of the entire THQ molecule into coal structures. This incorporation apparently takes place by way of electrophilic substitution on coal structures, notwithstanding THQ's obvious nucleophilic properties. The conversion of bibenzyl in D_2O/CO systems at 400°C was also studied. The experiments were conducted in stainless steel tubes. The products of the conversion of neat bibenzyl were in accord with previously reported chemistry, with toluene and stilbene the major products. D_2O had no effect on the product distributions. The addition of CO in the system reduced the amount of stilbene observed, and under basic conditions, stilbene was observed only as a minor product. The disappearance of stilbene paralleled the water-gas shift reaction. It is suggested that molecular hydrogen reacts with thermally produced benzyl radicals to give toluene and/or that stilbene is hydrogenated to give bibenzyl. The implications of this reaction in the conversion of coals in the CO/D_2O system are briefly discussed.

19516 (DOE/PC/41760—T3) **Method for separation of x-ray-diffraction spectra for cobalt-ZSM-catalysts.** De Angelis, R.J. (Kentucky Univ., Lexington (USA). Dept. of Metallurgical Engineering and Materials Science). 25 Feb 1982. Contract AC22-81PC41760. 13p. NTIS, PC A02. Order Number DE82012588.

The problem of separating x-ray diffraction spectrum of one of the components from the diffraction spectrum from a mixture, if the spectrum of the remaining components is known, is often encountered in diffraction experimentation. The spectrum separation problem becomes more complex when the mixture spectrum contains a number of overlapping Bragg peaks. The presentation of a method developed to unfold a complex spectrum from a mixture, using Fourier transforms of the spectrums, is the main objective of this manuscript. The cobalt spectrum obtained from a catalyst of 9.5 cobalt on ZSM-5 zeolite using the Fourier unfolding technique is presented. The results obtained in this investigation indicate this technique to be satisfactory in unfolding x-ray diffraction spectrum from a multiphase material. 5 figures, 1 table.

19517 (DOE/PC/50794—T1) **Change in catalyst activity during catalytic steam gasification of char. First quarterly report.** Shadman, F. (Arizona Univ., Tucson (USA). Dept. of Chemical Engineering). 10 Dec 1982. Contract FG22-82PC50794. 22p. NTIS, PC A02/MF A01. Order Number DE83005817.

The change in the catalyst (KOH) activity during char-CO_2 and char H_2O reactions at 700°C and 800°C is investigated. The instantaneous rate depends on both catalyst concentration (KC) and the internal porous structure of the solid. At low values of K/C atomic ratio, the rate increases sharply with the addition of catalyst. As catalyst concentration is increased, the rate first levels off and then decreases. The leveling off is attributed to the saturation of the surface with catalytic sites. The subsequent decrease in rate seems to be due to the plugging of micropores by catalyst deposits. The reaction rate changes significantly during gasification and drops sharply before gasification is completed. The drop in rate before total conversion can be explained by the catalyst accumulation and pore plugging. 13 figures.

19518 (EUR—7597-EN-Vol.1) **Present state of technology of recovery and conversion process for synthetic fuels.** Caemmerer, D.; Niclauss, M.; Schinke, H. (Commission of the European Communities, Luxembourg). 1981. 23p. Commission of the European Communities, Luxembourg.

The various sources of synthetic fuels (coal, oil, shale, biomass and hydrogen) are discussed, with the present stage of their development. The recovery and conversion processes for synthetic fuels are covered. This includes the technology, apparatus, pollution, economy, market structure, degree of conversion and energy balance, and also certain political developments which might become decisive. Future research and development for coal conversion and biomass processes are then recommended.

19519 (EUR—7633-d,e,f,i) **Round table meeting on chemical and physical valorisation of coal.** (Commission of the European Communities, Luxembourg). 1982. 369p. (CONF-8011177—). Commission of the European Communities, Luxembourg.

From Round table meeting on chemical and physical valorization of coal; Brussels, Belgium (24 Nov 1980).

This article covers a wide range of chemical and physical processes relating to coal preparation and conversion, including hydrogenation, solvent extraction, thermal cracking and pyrolysis. Specific reactions during these processes are examined in detail and the product yields assessed. Analytical techniques involving carbon labelling and high-performance liquid chromatography are described. Attention is also given to the processing of coal-derived products, with particular reference to polycyclic aromatic hydrocarbons. Other contributions deal with the treatment of waste water using activated carbon, improving the coking properties of coal, the use of pitches in the manufacture of electrodes and research into formed coke processes. Seventeen papers have been abstracted separately.

19520 (EUR—7633-d,e,f,i, pp 3-18) **Study of the behaviour of pyrite during hydrogenation of graphite.** Cypres, R.; Ghodsi, M.; Stocq, R. 1982. (In French). Commission of the European Communities, Luxembourg.

In Round table meeting on chemical and physical valorisation of coal.

This paper examines the behaviour of pyrite during hydrogenation of graphite. Kinetic analysis was carried out by thermogravimetry. The solid residues were examined by SEM and by X-ray and electron diffraction. The results as a whole indicate that hydrogenation of graphite at temperatures below 1000 degrees C can take place in the presence of metallic iron obtained from the pyrite. Neither the latter nor its reduced form, pyrrhotite, appear to have a catalytic effect on the graphite hydrogenation reaction. (19 refs.)

19521 (EUR—7633-d,e,f,i, pp 19-43) **Study of hydroliquefaction of a Lorraine coal.** Pregermain, S. 1982. (In French). Commission of the European Communities, Luxembourg.

In Round table meeting on chemical and physical valorisation of coal.

This study was carried out using discontinuous autoclave tests in order to provide guidance in selecting the operating conditions of a pilot plant with a throughput of a few kg of coal per hour. The tests described are mainly directed towards finding suitable iron-based catalysts. For this purpose a Lorraine coal with 35% volatile matter was used, with tetralin as solvent. Synthetic catalysts were prepared by coprecipitation of iron and aluminium oxide from the nitrate solution. These preparations demonstrated the decisive influence of particle size on the action of the catalyst. An atomization drying method enables particles a few microns in diameter to be produced, forming a catalyst which is much more active than the product obtained by oven drying followed by mechanical pulverization. Steelworks dusts (converter fumes) contain particles of more or less oxidized iron with sizes of between 0.1 and 1 MUm and one of the samples examined actually exhibits significant catalytic activity. The composition of the substances accompanying the iron (basic slag) appear to have, in certain cases, an inhibitory effect on catalytic activity. (5 refs.)

19522 (EUR—7633-d,e,f,i, pp 62-87) **Steam cracking of hydrogenated middle oils and model substances.** Hillebrand, W. 1982. (In German). Commission of the European Communities, Luxembourg.

In Round table meeting on chemical and physical valorisation of coal.

Thermal cracking of middle oil and model substances tetralin and t-decalin was investigated in a laboratory apparatus. Tetralin and t-decalin were cracked at temperatures of between 700 and 890 degrees C with residence times of between 0.06 s and 0.4 s. Whereas tetralin is dehydrogenated mainly to 1, 2-dihydronaphthalene and naphthalene, cracking of t-decalin mainly produces light olefins and BTX aromatics. In both cases the product yield can be represented as a function of the conversion of the substances. Coal tar oil first underwent two-stage hydrogenation followed by thermal cracking under identical conditions to those of the model substances. Due to different conditions during hydrogenation, products of varying aromatic content were obtained which in turn produced different ethylene yields during subsequent thermal cracking. The maximum yields of the principal products from a middle tar oil consisting of >99% saturated compounds were: 25 wt% C/SUB/2H/SUB/4, 8 wt% propylene, 5 wt% C/SUB/4-olefins, 30 wt% BTX aromatics. Compared with naphtha as feedstock, the ethylene yield is somewhat lower, the propylene yield considerably lower, and the BTX yield considerably higher. The characterization quantities (e.g. BMCI) developed for petroleum fractions are only of limited use for predicting the product distribution from coal tar oils. High-performance liquid chromatography proved to be a good method of characterizing coal tar oils. (3 refs.)

19523 (EUR—7633-d,e,f,i, pp 88-124) **Low-temperature pyrolysis of coal under hydrogen pressure.** Cypres, R.; Furfari, S. 1982. (In French). Commission of the European Communities, Luxembourg.

In Round table meeting on chemical and physical valorisation of coal.

Fixed-bed hydropyrolysis of coal was studied. An installation was built capable of treating 100 g of coal at up to 900 degrees C and 100 bar. Using a Beringen coal with 32.8% volatile matter it was shown that, in a fixed bed, a devolatilization rate is achieved which is of the same order as that obtained by flash hydropyrolysis. However, the oil yield is lower due to the slower heating of the coal and the relatively long residence time of the primary volatile matter in the reaction zone. The composition of the oil depends on the pyrolysis temperature. Its benzene content increases with the latter. At constant temperature it can be shown that the influence of the hydrogen partial pressure is particularly significant between 0 and 10 bar. Above this pressure the variations in yields and compositions as a function of pressure are markedly reduced. It was also shown that from 580 degrees C, pyrolysis under hydrogen pressure produces an additional quantity of water compared with pyrolysis in an inert atmosphere under pressure or at atmospheric pressure. The increase in the amount of water formed is due to the hydrogenation reactions of the hydroxyl functions of the heavy phenols and the xylenols. This causes a hydrogen consumption equivalent to 0.2 to 0.3 wt% of coal, depending on the pyrolysis temperature. (21 refs.)

19524 (EUR—7633-d,e,f,i, pp 125-153) **Studies of the pyrolysis mechanisms of tricyclic aromatic compounds and their hydrogen derivatives, traced by means of radioactive carbon and tritium.** Bettens, B.; Ninauve, F. 1982. (In French). Commission of the European Communities, Luxembourg.

In Round table meeting on chemical and physical valorisation of coal.

Synthesis of phenanthrene 9T is obtained by catalytic reduction of the corresponding brominated derivative. The synthesis of the dehydrophenanthrene 9T, perhydrophenanthrene 9T and perhydrophenanthrene 9-10^{14}C is obtained by catalytic hydrogenation reactions under pressure in well defined temperature, reaction-time and pressure conditions. The pyrolysis of tritiated and ^{14}C-labelled phenanthrene was effected at temperatures of 850 to 900 degrees C with a residence time of 2 to 2.5 seconds. The various phases are analysed by radiochromatography. The results show that phenanthrene possesses a high degree of stability with virtually total conversion to carbon and methane at high temperature, and that the thermal degradation of the molecule at lower temperature occurs basically by two routes: elimination of carbon 9 or 10 with the formation of fluorene and methane, and elimination of a C_4 fragment including either carbon 9 or 10 and leading mainly to the formation of naphthalene. (11 refs.)

19525 (EUR—7633-d,e,f,i, pp 154-164) **Study of pyrolysis of perhydrofluorene and perhydropyrene.** Bredael, P. 1982. (In French). Commission of the European Communities, Luxembourg.

In Round table meeting on chemical and physical valorisation of coal.

Pyrolysis of perhydrofluorene and perhydropyrene was studied at temperatures of between 750 and 1000 degrees C with a residence time in the reactor of 2 x 10^{-3} sec. BTX yields of the order of 30 wt% were obtained, accompanied by the production of 40 wt% of a gas mixture rich in olefinic compounds. The results obtained, compared with those already documented for pyrolysis of c-decalin and perhydroindane, exhibit a similarity in the primary stages of the mechanism of thermal degradation of the perhydrogenated aromatic compounds. These confirm the validity of a process for producing light aromatic hydrocarbons from polynuclear aromatic compounds by perhydrogenation and thermal cracking. (4 refs.)

19526 (EUR—7633-d,e,f,i, pp 165-181) **Tar formation during pyrolysis of coals at pressures of up to 100 bar.** Arendt, P.; Van Heek, K.H. 1982. (In German). Commission of the European Communities, Luxembourg.

In Round table meeting on chemical and physical valorisation of coal.

Describes pyrolysis of five German coals under various gas atmospheres at pressures of up to 100 bar in two separate apparatuses differing basically in the heating-up rates attainable. One apparatus consists of a pressure thermobalance in which a coal sample of 1.5 g is heated at 3 K/min in a gas stream of 3 l/min. For rapid heating rates (10^2 to 10^3 K/s) 10 mg of finely ground coal is placed in a layer between special-steel wire meshes and heated linearly using a regulated electric current. The gaseous components H_2, CH_4, C_2H_4, C_2H_6, CO, CO_2 and H_2O are quantitively determined. Coke and tar are determined by weighing. The results clearly demonstrate the influence of pressure, heating rate and gas atmosphere on the quantity and composition of the tar. Low pressure and rapid heating rates in the presence of inert gas produce high tar yields. Increasing pressure and slow heating promote tar decomposition by thermal cracking. In the presence of hydrogen at high pressure and a slow heating rate a noticeable effect is observed. An additional quantity of highly aromatic compounds released directly from the coal material between 500 and 700 degrees C increases the tar yield. Rapid heating rates reduce this effect, as beyond this range the high concentration of decomposition products in the particle strongly inhibits the entry of hydrogen. (8 refs.)

19527 (EUR—7633-d,e,f,i, pp 182-199) **The thermal cracking of coal-derived materials to BTX and ethylene.** Berhardt, R.S.; Ladner, W.R.; Newman, J.O.H.; Sage, P.W. 1982. Commission of the European Communities, Luxembourg.

In Round table meeting on chemical and physical valorisation of coal.

The vapour phase thermal cracking (i.e. non-catalytic) of a range of coal-derived materials and pure compounds using laboratory scale reactors is described. Up to 27% benzene, toluene and xylenes (BTX) and 24% ethylene were obtained by cracking hydrogenated coal extract, compared with less than 4% of each from unhydrogenated extract, anthracene oil and coal, confirming the importance of naphthenes (cyclic aliphatics) and BTX and ethylene precursors. Experiments with pure compounds showed that product yields could be predicted closely from the cracking pattern of the components and the composition of the mixtures. (13 refs.)

19528 (EUR—7633-d,e,f,i, pp 290-316) **Benzene-soluble bitumen constituents and coking power of hard coals.** Abel, O.; Gao, J.; Oelert, H.H. 1982. (In German). Commission of the European Communities, Luxembourg.

In Round table meeting on chemical and physical valorisation of coal.

Following on from earlier studies by other authors, six hard coals with between 14 and 38% volatile matter were subjected to benzene-pressure extraction at temperatures of 280 C and above and the resultant extracts separated into solid bitumens and oily bitumens by precipitation with petroleum ether. The study examines the changes in coking properties (dilatation and G-value, swelling index and Roga index, and maximum fluidity in the Giseler plastometer) caused on the one hand by the decomposition treatment itself and bitumen extraction and, on the other, by the addition of total bitumens, solid bitumens or oily bitumens to the extraction residues or the original coals. The results show that caking and coking properties are partly reduced already by decomposition (without bitumen extraction) because they are determined by the colloidal structure of the coal. The caking and coking properties of the original coal cannot therefore be restored by adding isolated bitumens to the extraction residues. Only the values of the associated pressure-decomposed samples are achieved. By admixture of bitumens with the original coal, the latter's coking properties can be considerably improved. Both oily and solid bitumens increase dilatation; the caking properties are reduced by oily bitumens but increased by solid bitumens. The maximum fluidity per Gieseler is influenced in similar manner by benzene-soluble, coal-derived bitumen as by the addition of carbopitch or petroleum pitch. (8 refs.)

19529 (EUR—7633-d,e,f,i, pp 350-365) **Carbonization of coals in the C.S.M. formed-coke process.** Palumbo, L.; Colletta, A. 1982. (In Italian). Commission of the European Communities, Luxembourg.

In Round table meeting on chemical and physical valorisation of coal.

A new process for the production of formed coke has been realized by the Centro Sperimentale Metallurgico with the financial support of the main Companies of the Finsider Group. The process employs fluidized-bed technology with recirculation of the pyrolysis gases to obtain a carbonized material: the formed coke is in the form of briquets produced by compacting the carbonized material with the binder obtained in the same process. The briquets are hardened and baked in a vertical furnace at controlled temperature and pressure. The new process can use all types of coal, especially noncoking, medium-high volatile varieties. In addition, the recirculation technique allows gases to be obtained which are of industrial use as fuels or reducing agents. A feasibility study carried out in collaboration with the Italimpianti Company has demonstrated the economic and technical advantages compared with conventional coking processes, including a drastic reduction in pollution. (25 refs.)

19530 (EUR—7697-DE/EN(Vol.2)) **State of the art of winning and conversion processes for synthetic fuels.** Caemmerer, D.; Niclauss, M.; Schinke, H. (Commission of the European Communities, Luxembourg). 1982. 334p. (In German). Available from Commission of the European Communities, Luxembourg.

Coal gasification and liquefaction, oil extraction from oil shales, and biomass conversion into ethanol and biogas are dealt with. Economic aspects of the various conversion processes are discussed as well as the consumption of externally supplied hydrogen in synfuel production, energy consumption in synfuel production, and pollutants produced in synfuel production. Technological aspects of alternative synfuels are reviewed as well as the possible consequences on employment and the political situation.

19531 (NP—3900024) **Measured data acquisition in an externally heated rotory kiln lignite gasification system.** Sterzelmeier, K.K. (Technische Hochschule Aachen (Germany, F.R.). Fakultaet fuer Bergbau und Huettenwesen). 17 Mar 1980. 171p. (In German). NTIS (US Sales Only), PC A08/MF A01. Order Number DE83900024.

Thesis.

Measuring problems occurring in crude brown coal gasification in a rotary kiln with exothermal heating are discussed, i.e. pressure resistance of electronic components, data transmission from the rotating section to the laboratory system, and the problem of indirect capacitive moisture measurement in the product gas. All three contributions are classified as belonging to the field of electronic data acquisition.

19532 (PB—81-245839) **Vaporization and chemical transport under coal gasification conditions.** Hastie, J.W.; Bonnell, D.W.; Plante, E.R.; Horton, W.S. (National Bureau of Standards, Washington, DC (USA)). Dec 1980. 114p. NTIS, PC A06/MF A01.

Transpiration mass spectrometry for the quantitative analysis of high vapor temperature gases and vapors is described. This technique was applied to vapor transport and thermodynamic activity determinations for real and synthetic coal slag samples in reactive coal gas components at atmospheric pressure. A highly nonideal and nonmonotonic (with temperature and composition variables) behavior for alkali metal vapor transport was indicated. Thus a priori predictions of alkali metal transport in coal gasifiers without actual activity data are virtually impossible at the present time. Surface segregation and diffusion limitations of alkali species in slags are also possible complicating effects.

19533 (UCID—19169-Rev.1) **Underground coal gasification data base.** Cena, R.J.; Thorsness, C.B.; Ott, L.L. (Lawrence Livermore National Lab., CA (USA)). 24 Nov 1982. Contract W-7405-ENG-48. 612p. NTIS, PC A99/MF A01. Order Number DE83008245.

The Lawrence Livermore National Laboratory has developed a data base containing results from fourteen DOE-sponsored underground coal gasification (UCG) field tests. These tests include three performed by LLNL near Gillette, Wyoming at the Hoe Creek site, eight performed by LETC at a site near Hanna, Wyoming, two by GULF near Rawlings, Wyoming, and one performed by METC near Princetown, West Virginia. All tests were done in flat lying coal seams except the Rawlings tests, which utilized a steeply dipping seam. The report presents process parameters and the results of material and energy balances for each test in a variety of forms. The raw process data used to construct the data base is first discussed along with material and energy balance conventions. Following this, each test is described with the process geometry and a brief operating chronology given. Differential and integral summary information in tabular and graphic form is provided for each test. Computer tapes of the entire data base may be requested from the authors through the Lawrence Livermore National Laboratory.

19534 **Letdown valve performance at Exxon and H-coal pilot plants.** *Materials and Components in Fossil Energy Applications;* No. 39, 1-4(1 Aug 1982).

This second article in a series reports on the operating experience of letdown valves in coal liquefaction plants, describes the behavior of modified Kieley-Mueller and Cameron valves and is based on information gathered from public literature.

19535 (DOE/OR/20807—T1-Vol.5-(Proj.Review)) **Tri-State Synfuels Project Review: Volume 5. Engineering costs, budgets and schedules.** (Tri-State Synfuels Co., Houston, TX (USA)). Jun 1982. Contract FC05-81OR20807. 84p. NTIS, PC A05/MF A01. Order Number DE83007448.

This section contains estimated costs and schedules for case studies 13, 14 and 15, plus certain back-up data such as a construction labor survey in the area, original and revised budgets, risk analysis, etc. These cases are described as follows: Case 13 - Nominal quarter-size plant to produce gasoline from coal via a methanol intermediate. Case 14 - Nominal quarter-size plant to produce chemical grade methanol from coal. Case 15 - Nominal half-size plant to produce gasoline from coal via a methanol intermediate.

19536 **Level indicator for pressure vessels.** US Patent Application 6-372,861. 28 Apr 1982. 28p. Contract AI22-80PC30258.

A liquid-level monitor for tracking the level of a coal slurry in a high-pressure vessel including a toroidal-shaped float with magnetically permeable bands thereon disposed within the vessel, two pairs of magnetic-field generators and detectors disposed outside the vessel adjacent the top and bottom thereof and magnetically coupled to the magnetically permeable bands on the float, and signal-processing circuitry for combining signals from the top and bottom detectors for generating a monotonically increasing analog control signal which is a function of liquid level. The control signal may be utilized to operate high-pressure control valves associated with processes in which the high-pressure vessel is used.

19537 **Low-Btu gasification utility demonstration project.** Rodgers, M.B.; Andrus, H.E. Jr. (Gulf States Util Co, Beaumont, TX, USA). *Coal Technology;* 4: 157-177(1981). (CONF-8111140—).

From 4. international coal utilization conference; Houston, TX, USA (17 Nov 1981).

Gulf States Utilities Company's analysis of the need for coal gasification is discussed and the states of the demonstation plant project is summarized. Out of four candidates for a demonstration program (Combustion-Engineering, British Gas Corporation, Foster Wheeler, and Allis-Chalmers processes) the C-E program has been chosen as the most promising. The process development and the prelimary design of the demonstration plant at Westlake, La, is described. Plant integration concepts have been investigated and the initial process flow diagrams have been developed. 8 refs.

19538 **District gasification in New Jersey.** Huber, D.A.; Wei, S.K.; Piascik, T.M. (Burns and Roe). *Coal Technology;* 4: 329-352(1981). (CONF-8111140—).

From 4. international coal utilization conference; Houston, TX, USA (17 Nov 1981).

A preliminary study evaluation has manifested an overall technical and economic feasibility for producing a medium Btu quality gas (MBG) from eastern coal at PSEandG's Sewaren Generating Station in New Jersey by the Texaco entrained gasification process. The production of MBG for use as a fuel gas for on-site power plant boilers or for distribution to industrial customers appears to be economically attractive and in the spirit of the national goal of energy independence. For example, a 2000 tons/day coal gasification plant used to supply fuel to the Sewaren boilers would displace approximately 1,3000,000 barrels of fuel oil per year. In addition to the possible economic advantages of coal gasification, certain environmental advantages were identified in this study. The SO_2 emission from buring MBG are expected to be considerably less than from burning either coal or oil. Particulate emissions from burning MBG are also less than those from burning coal directly. However, no detailed studies were conducted to determine whether and to what extent any boiler derating would occur as the result of firing with MBG. 8 refs.

19539 **Preliminary assessment of the integration of a coal gasifier into a petroleum refinery.** Humphrey, J.L. (Argonne Natl Lab, IL, USA). *Coal Technology;* 279-291(1981). (CONF-8111140—).

From 4. international coal utilization conference; Houston, TX, USA (17 Nov 1981).

Argonne National Laboratory, in association with Hunt Oil Company and Westinghouse Electric Corporation, has evaluated the integration of a coal gasifier into a petroleum refinery. The refinery used for this study is the 30,000 BPD Hunt Oil Company refinery in Tuscaloosa, Alabama. The major gasification-train components include the Westinghouse fluidized-bed gasifier, an air separation plant, a heat-recovery system, Selexol acid-gas removal, and a sulfur-recovery plant. The gasification train will convert a nominal 280 tons/day of petroleum coke to 790,000 SCF/hr of 365-Btu/SCF gas (equivalent to 7×10^6 SCFD of natural gas), which comes close to replacing the entire 7.5×10^6 SCFD of natural gas that must be purchased. The total capital investments for a 311-ton/day plant (280-ton/day nominal feed rate with operating factor of 90% is estimated to be 41×10^6 (1986 basis. This results in a manufacturing cost for the MBG in 1986 of 4.99×10^6 Btu, based on 2.53×10^{12} Btu/yr of gas generated. 5 refs.

19540 **Coal is a gas.** Maurer, R.E.; O'Donnell, K. (Black, Sivalls and Bryson Inc, Pooler, AR). *Coal Technology;* 293-307(1981). (CONF-8111140—).

From 4. international coal utilization conference; Houston, TX, USA (17 Nov 1981).

The technology and plant design of the first utility anthracite gasification plant in the USA, at Hazelton, Pennsylvania, is reviewed. The operation of the facility and the usage of the gas in small industrial-sized borders is described. The plant includes a fixed bed atmospheric gasifier. A gas free of tars and oils is produced. Only particulates and moisture have to be removed. 2 refs.

19541 **(DOE/ET/14858—T2) Development of alcohol-based synthetic transportation fuels from coal-derived synthesis gases. Final technical report, September 1979-July 1982.** (Chem Systems, Inc., Fairfield, NJ (USA). Research and Development Group). 15 Dec 1982. Contract AC22-79ET14858. 356p. NTIS, PC A16/MF A01. Order Number DE83004857.

Chem Systems, Inc. has completed a two-year R and D program formulated to develop catalysts and a reaction system for the conversion of coal-derived synthesis gases to alcohol-based, synthetic transportation fuels. The program was initiated on September 14, 1979 and involved a four-task approach which included a catalyst formulation and screening phase, a process variables evaluation phase utilizing laboratory-scale and bench-scale reactors, and a technical and economic analysis phase. The major accomplishments and conclusions achieved during the course of the program are summarized below: ALKANOL fuels, containing mixtures of methanol and C_2-C_6 saturated alcohols, represent a means of incorporating methanol into the gasoline pool while simultaneously circumventing most of the technical problems associated with the use of neat methanol-gasoline blends. Preferred catalysts and reaction conditions have been identified for the conversion of simulated coal-derived synthesis gases to ALKANOLS at high selectivity. An activity maintenance test made with one of these catalysts in a Berty gradientless, vapor-phase reactor indicated that the activity of the freshly reduced catalyst improved with on-stream time over the nominal 300-hour test while the selectivity to ALKANOLS maintained essentially constant. An analysis of the value of ALKANOLS as a gasoline pool blending stock indicates that there are certain scenarios in which specific ALKANOL fuel compositions have refining values equivalent to or better than some of the current octane improvement methods used by petroleum refiners.

19542 (EUR—7633-d,e,f,i, pp 317-349) **Study of the binding power of pitches for electrodes.** Chiche, P. 1982. (In French). Commission of the European Communities, Luxembourg.

In Round table meeting on chemical and physical valorisation of coal.

The binding power of three filtered coal tar pitches and a pitch of petroleum origin was studied in comparison with a petroleum coke. For purposes of comparison, one of the coal tar pitches was examined prior to filtration and after thermal development of a certain quantity of anisotropic mesophase. Examinations were carried out, on the one hand, on the pitches alone - technical and physico-chemical analyses - and, on the other, on the experimental electrodes before and after carbonization. The variation in volume of the pitch-coke mixture under the moulding pressure of the electrode as a function of the proportions of the mixture allows determination of the optimum amount of pitch necessary to fill the inter- and intragranular porosity of the coke. The results obtained for the carbonized electrodes clearly show, on the one hand, the beneficial effect of the aromaticity of the pitch on the quality of the binding judged by the density and electrical conductivity of the final electrode and, on the other, the detrimental effect of the insoluble particles - natural alpha resins or mesophase - which can block the pores of the coke or alter its moulding by the isotropic phase.

19543 (ACIRL-PR—81-11) **Examination of the mineral components of coal and its resultant fly ash in relation to resistivity characteristics of the fly ash.** Pandich, T.; Sullivan, K.M. (Australian Coal Industry Research Labs. Ltd., North Ryde). Dec 1981. 54p. Australian Coal Industry Research Labs. Ltd., North Ryde.

Eleven widely ranging coals and their associated fly ash samples were obtained from several Australian power stations, The coal minerals and fly ash were examined by x-ray fluorescence and x-ray diffraction techniques for elemental chemical and clay mineral analyses. The fly ash was also examined for electrical resistivity and surface chemical analysis using x-ray photoelectron spectroscopy. Scanning electron microscopy was used to examine both the coal and fly ash particles. This confirmed that fly ash comprises a large number of particles of differing appearance or nature, chemical composition and shape, which led to the development of a nature, composition, shape classification system for identifying fly ash using a scanning electron microscope. Using this system relationships were observed between the nature and composition of particles. A mathematical examination of the several chemical analysis and their relationship to the resistivity characteristics of the fly ash was undertaken. Although potential correlation between some coal characteristics and fly ash resistivity were observed, no firm relationship was established. (8 refs.)

19544 (CONF-821106—15) **Physical-property estimation for coal liquids.** Khan, A.A.; Barker, R.E.; Begovich, J.M. (Oak Ridge National Lab., TN (USA)). 1982. Contract W-7405-ENG-26. 38p. NTIS, PC A03/MF A01. Order Number DE83003483.

From Annual meeting of heat transfer and energy conversion; Los Angeles, CA, USA (14 Nov 1982).

Improved design of coal liquefaction facilities is dependent on the availability of accurate thermodynamic property estimation methods. However, since coal liquids are mixtures of a large number of pure components bound together in a complex heteroatomic group structure; traditional methods for estimating thermodynamic properties are often inapplicable. Three sets of physical properties correlations-Cavett (1962), Wilson (1981), and Starling (1980)-have been used in conjunction with the ASPEN simulator (MIT, 1981) to critically evaluate against experimental vapor-liquid equilibrium data the utility of ASPEN for simulating coal liquid separations. All three correlations were found to give close correspondence between predicted and experimental K-values for temperatures between 478 and 589 K at 13.89 MPa except for heavy boiling fractions. It was also found for the limited data examined from the SRC-II PDU vacuum flash unit that using Wilson's correlations with the Redlich-Kwong-Soave method in ASPEN predicts vapor mole fractions close to experimental results. The utility of ASPEN for coal liquids has thus been demonstrated. Examination of experimental data indicates that better boiling point characterization data, including improvements in measurements of specific gravity and molecular weight, may further improve simulation capabilities.

19545 (DOE/ET/11426—T2) **Small-angle x-ray scattering studies of the porosity of coals and chars. Final technical report, Sept. 30, 1978-March 31, 1981.** Schmidt, P.W. (Missouri Univ., Columbia (USA). Dept. of Physics). 10 Feb 1983. Contract AC22-77ET11426. 12p. NTIS (US Sales Only). Order Number DE83007040.

Small-angle x-ray scattering measurements are reported for 15 coal samples in the PSOC series of coals. The rank of the coal was found to be the main factor determining the form of the small-angle scattering curves. Analysis of the scattering curves provides evidence for the presence of three classes of pores--(1) large pores, with dimensions of at least 300 A, (2) intermediate sized pores, with average dimensions of the order of 100 or 200 A, and (3) very small pores, which with dimensions no greater than about 30 A. These three types of pores are referred to as macropores, transition pores, and micropores, respectively. The system of three kinds of pores suggested by the x-ray scattering data is in good agreement with the three-class pore structure developed by other workers' investigations employing techniques besides small-angle x-ray scattering. The specific surfaces of the coals were calculated from the scattering curves. A method was developed for estimating the fractions of the total specific surface which should be assigned to the macropores and transition pores under the assumption that the specific surface computed from the scattering curves did not include any contribution from the micropores. The specific surfaces calculated from the scattering data have been compared with the specific surfaces obtained by adsorption of nitrogen at low temperatures and by carbon dioxide at room temperature. The x-ray data are not consistent with the suggestion that many pores have dimensions of some hundreds of Angstroms but have restricted openings which exclude nitrogen at low temperatures. Instead, the high values of surface area obtained by carbon dioxide adsorptiom must be the result of the contribution of a large number of pores with minimum pore dimensions which are not greater than about 30 A. 2 figures, 1 table.

19546 (DOE/METC—82-51, pp 8-13) **Structural concepts of coal and implications of dynamic interaction.** Leonard, E. (Los Alamos National Lab., NM). Sep 1982. NTIS, PC A10/MF A01.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

Considerable progress has been reported during the last few years describing the chemical nature of coal. Newer coal structure concepts show that coal is a mixture of organic compounds. Varmann showed that coal contains significant quantities of small molecules of organic compounds having molecular weights of 200 to 300. His data, as well as data using supercritical hydrocarbon extraction processes (British National Coal Board), were suspect since molecular cleavages might occur during the severe processing steps. However, recent work at Los Alamos using pressurized, liquid carbon dioxide at 0°C again shows that stable molecules are readily removed from coal, confirming the presence of significant quantities of an apparent guest fraction. Coal then appears to be composed of stable compounds of variable composition trapped within an intractable (polymeric) matrix. This new host-guest, polymer-volatile type coal model appears as a major advance over other, essentially planar, structures. Extractive techniques, especially using liquid carbon dioxide, followed by GC-MS, had led to the nature of the guest components, even though much definitive quantitative work still remains to be done. The nature of the host fraction remains more speculative. Preliminary work at Los Alamos presumes that the host structures are composed of condensed alpha-hydroxycarboxylic acids, derived from substituted phenylpropanes. These concepts have support in recent field ionization-mass spectrometry studies in Germany (Schulten). Newer technologies need the support of an improved molecular framework describing the structure of coals. This research activity explores the validity and utility of the guest polymeric host model of coal.

19547 (DOE/METC—82-51, pp 14-19) **Investigations of the changes of coal structure occurring during gasification.** Griffiths, P.R. (Ohio Univ., Athens). Sep 1982. NTIS, PC A10/MF A01. Contract FG22-80PC30210.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

A detailed knowledge of how the chemical structure of coals affects their reactivity should greatly enhance our capability of controlling coal beneficiation reactions. Currently, two spectroscopic techniques can give information on coal structure; these are infrared and nuclear magnetic resonance spectrometry (NMR). The more popular of the two technique today appears to be NMR, yet solution phase measurements only give information on the portion of the coal that is extractable in a solvent such as pyridine while cross-polarization magic-angle NMR techniques, allow the spectrum of the solid whole coal to be measured, yield spectra with rather broad absorption bands measured at low signal-to-noise ratio (SNR), and require very expensive instrumentation. The information content of infrared spectra is theoretically higher than NMR spectra, but again several drawbacks are encountered. Techniques developed at Ohio University will enable at least two of these objections to be overcome, and possibly all three. Diffuse reflectance infrared spectra, measured on a Fourier transform spectrometer, can be obtained on powdered coals directly with no pretreatment other than grinding. The SNR of these spectra is so high that it is possible to apply a technique for resolution enhancemnt known as

Fourier self-deconvolution to sharpen up the absorption bands to such an extent that much more detailed information can be obtained on the structure of coals. The greater complexity of the spectra leads to new problems of band assignments, but even this should ultimately prove to be quite beneficial.

19548 (DOE/METC—82-51, pp 97-99) **Tables of thermodynamic data for selected chemical species.** Chase, M.W. Jr. (Dow Chemical Co., Midland, MI). Sep 1982. NTIS, PC A10/MF A01. Contract AC22-76ET10637.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

The present DOE contract extends the scope of JANAF Thermochemical Tables to cover chemical species occurring in gasifiers, methanators, combustors, MHD generators, fuel cells, gas turbines, etc., that use coal or other fossil fuel products as their feedstocks. This Dow project will review literature, evaluate accuracy of measurements, calculate thermodynamic functions, and publish thermodynamic tables in a manner that is consistent with the JANAF Thermodynamic Tables. Timely summaries of uncertain, missing, or inconsistent data are to be issued with the other products under this contract that will appear as quarterly supplements to the existing JANAF Thermochemical Tables.

19549 (DOE/OR/20807—T1-Vol.1(Commercial)) **Tri-State Synfuels Project Commercial Scale Coal Test: Volume 1. Selection of camp 1 coal.** (Tri-State Synfuels Co., Houston, TX (USA)). Jun 1982. Contract FC05-81OR20807. 135p. NTIS, PC A07/MF A01. Order Number DE83007436.

This report focuses on the rationale for selecting Camp 1 coal for a commercial scale gasification test conducted at the Sasol One Plant. The initial coal quality evaluation consisted primarily of The Pennsylvania State University coal data from Illinois Basin Counties. In November 1980, a preliminary collection of Illinois Basin coal quality data was developed to support the selection of coals for potential plant supply and full scale commercial testing. The total sample and coarse and fine fractions were analyzed. Lurgi and Sasol examined the list and gave their reasons for selection but they had not examined the samples in their laboratories. In December 1980, the list of potential source mines for the 22,000 short ton sample of raw coal for the test was narrowed to three. The mines were Camp 1, Ken and Providence. The reasons for this selection are given. The three candidate mines were again sampled and representative splits of the run-of-mine samples were flown to Lurgi and to Sasol for examination. The Lurgi laboratory report indicated that both Camp 1 and Ken mine samples would qualify as suitable gasifier feed coals. Sasol concluded from an examination of the November report data that Camp 1 and Ken mine samples would be preferable since the free swelling indices are not excessive. Paul Weir Company examined the data and recommended Camp 1 mine since it operates in the seams contiguous to other potential candidate reserve sites and has the ability to transport the mine sample by belt to a barge loading facility to limit production of fines. The final selection of the Camp 1 mine for the test shipment resulted from considerations given in the report.

19550 (DOE/OR/20807—T1-Vol.1(Sampling)) **Tri-State Synfuels Project Coal Sampling and Testing Program: Volume 1. Sampling and results.** (Tri-State Synfuels Co., Houston, TX (USA)). Jun 1982. Contract FC05-81OR20807. 235p. NTIS, PC A11/MF A01. Order Number DE83007437.

This report focuses on the sampling and testing program of run-of-mine Illinois Basin coals which was conducted for the supply and design program of the Tri-State Synfuels Project. The basic objective was to identify coals suitable for Lurgi gasification which would supplement the Camp 1 coal used as the design coal for the Tri-State Synfuels Project. The Camp 1 coal had been selected for the commercial scale gasification test at Sasolburg on the basis of its proximity to the Towhead Island Reserves, plant site and similarity of coal quality. The information developed was used as technical guidance for: assessing reserves potentially available for the project during supply negotiations; establishing a sensitivity range for the Lurgi design which used the Camp 1 coal for heat and material balances (the maximum heat rates and flow rates were used to specify requirements for major equipment); and establishing environmental design criteria in the areas of wastewater treatment and solids disposal. These results are covered in the project review reports for development, engineering and environmental aspects. The sampling and testing program consisted of selecting, collecting, preparing and analyzing samples from ten mines in Kentucky, Indiana and Illinois. The mines were operated by Peabody, Island Creek, Amax and Old Ben coal companies and represented a mix of underground - both continuous and conventional mining - and strip mining. The two predominant seams in each of the three states were sampled. The resulting technical data were judged to be representative of the coal available from reserves of the various operators. Paul Weir Company was responsible for conducting the program.

19551 (DOE/OR/20807—T1-Vol.2) **Tri-State Synfuels Project Coal Sampling and Testing Program: Volume 2. Analytical testwork.** (Tri-State Synfuels Co., Houston, TX (USA)). Jun 1982. Contract FC05-81OR20807. 284p. NTIS, PC A13/MF A01. Order Number DE83007439.

This volume contains detailed coal size analyses for the sample preparation and analytical results on the physical properties and chemical composition of the total, coarse and fine fractions. This information is useful in establishing purchase specifications and design coal sensitivity ranges for equipment sizes. The ten coals are from the following mines: Old Ben, Lynnville, Lynville 1, Camp 11, Hamilton, Providence, No. 9, Marissa, Wabash and Delta. The analytical information prepared by Commercial Testing and Engineering (Secion 2.0) contains size analyses for the actual run-of-mine coal, a representative run-of-mine coal, the run-of-mine coal crushed in the laboratory to pass 2 inches, and the total, coarse and fine fractions based on 2-inch top size. In some cases total, coarse and fine fractions had to be simulated because the operating mine breaker was not set for 2-inch top size or the mine did not have a breaker. The coal and coal ash analysis details prepared by Commercial Testing and Engineering are reported in Section 3.0. The ASTM standard methods include the proximate and ultimate analyses, equilibrium moisture, gross calorific value, sulfur forms, tumbler test, free swelling index, Hardgrove grindability, ash mineral analysis, and ash fusion temperatures. The special analyses are caking number, water soluble alkalies, spectroscopy, fluorine, mercury and Fischer assay. The University of Kentucky - Institute for Mining and Minerals Research - report their coal and coal ash analytical data.

19552 (DOE/OR/20807—T1-Vol.13) **Tri-State Synfuels Project Review: Volume 13. Coal sampling and testing.** (Tri-State Synfuels Co., Houston, TX (USA)). Jun 1982. Contract FC05-81OR20807. 44p. NTIS, PC A03/MF A01. Order Number DE83007453.

This report focuses on the sampling and testing program for run-of-mine Illinois Basin coals which was conducted for the supply and design program of the Tri-State Synfuels Project. The program is reported in detail in Coal Sampling and Testing, Volumes 1 and 2. Ten mines representative of future coal production were examined. The mines represented a mix of underground - both continuous and conventional mining - and strip mining. The two predominant seams in each of three states were sampled. The technical data on these run-of-mine coals were judged to be representative of the coal to be mined from potentially available reserves by the various operators. The overall program was conducted to identify coals suitable for Lurgi gasification which would supplement the data from the Camp 1 coal being used as the design coal for the Tri-State Synfuels Project. The Camp 1 coal had been selected for the commercial scale gasification test at Sasolburg on the basis of its proximity to the Towhead Island Reserves, plant site and similarity of coal quality. The sampling and testing program for Camp 1 coal has been reviewed in the Tri-State Synfuels Project Review Report, Volume 14, Commercial Scale Coal Test, June 1982.

19553 **(DOE/PC/10342—T1) Particle-size effects in oxidation of pyrite in air/water chemical coal cleaning. Final report, March 1, 1979-February 29, 1980.** Shah, Y.T.; Joshi, J.B. (Pittsburgh Univ., PA (USA). Dept. of Chemical and Petroleum Engineering). Mar 1980. Contract AC22-79PC10342. 48p. NTIS, PC A03/MF A01. Order Number DE83008115.

Process development of a means for precombustion removal of sulfur from coal by selective oxidation in an aqueous slurry is reported. The kinetics of the oxidation of pyritic sulfur and heating value loss for Lower Freeport coal are investigated. Experiments were conducted in a semibatch manner. The effects of coal particle size (< 72, 72 to 99, 150 to 208, 208 to 430, 700 to 1410, microns), reaction time (0 to 5400s), temperature (150 to 200°C) and partial pressure of oxygen (0.28 to 1.36 MPa) were studied. The oxidation of pyritic sulfur follows the shrinking core model where the rate controlling step was found to be the reaction between oxygen and pyrite. The analysis of the experimental data obtained in the range of variables covered in this work suggests that the rate controlling step in pyrite oxidation is the intrinsic chemical reaction between the dissolved oxygen and pyrite. The shrinking core model was successfully applied for the calculation of rate constant. The values of rate constant are practically independent of the coal particle size and oxygen partial pressure in the range covered in this work. An activation energy of 35×10^3 kJ/kmole was found. Equations for the coal weight loss and heating value loss are given.

19554 **(DOE/PC/30008—T6) Cross-polarization nuclear magnetic resonance studies of coals, coal-conversion products, and coal-conversion catalysts. Final technical report.** Maciel, G.E. (Colorado State Univ., Fort Collins (USA). Dept. of Chemistry). 1 May 1982. Contract AC22-80PC30008. 43p. NTIS, PC A03/MF A01. Order Number DE83005406.

Cross polarization magic-angle spinning ^{13}C NMR spectra of all of the samples studied are collected in this report. Because of the widely-varying characteristics of the spectra obtained on this project (e.g. different linewidths, aliphatic/aromatic ratios, aromatic chemical shift anisotropies as manifested in spinning sidebands) and because of the progress of research during the period of the project, the spectra were partitioned for analysis in various ways. In preparing this final report, we have standardized the partitioning into two alternate schemes. In one scheme the spectrum is divided arbitrarily into an aliphatic region (95 ppM to -10 ppM) and an aromatic region (the remainder of the spectrum, including spinning sidebands. This partitioning gives the f/sub a/' values (apparent aromatic fraction) reported in the tables. As the only significant sidebands from MAS come from the aromatic resonances, this (and the second) approach should account for the sidebands properly as aromatic intensity. In the second partitioning scheme the spectra are divided into three regions (I, II, III). Region II spans from 105 ppM to 70 ppM, region III from 70 ppM to -10 ppM and Region I is the remainder of the spectrum (aromatic/olefinic resonances, including their spinning sidebands). The expected error ranges given with the f/sub a/' values in the tables of this report are estimates based on experience with numerous similar samples and several replicate determinations. 33 figures, 5 tables.

19555 **(DOE/PC/30013—F2-Pt.2) Data base for the analysis of compositional characteristics of coal seams and macerals. Final report. Part 2. A multivariate study of the interrelationships among selected variables of the organic fraction of samples of United States' coals.** Gerencher, J.J. Jr. (Pennsylvania State Univ., University Park (USA). Coal Research Section). Jan 1983. Contract AC22-80PC30013. 637p. NTIS, PC A99/MF A01. Order Number DE83006580.

Multivariate statistical techniques have been applied to study interrelationships among 12 variables within a set of 277 coals representing whole-seam channel, column, and core samples obtained from each of the 6 coal provinces of the United States, and varying in rank from lignite through anthracite. The data are maintained in computerized data base at The Pennsylvania State University Coal Research Section. The variables selected are components of the elemental analysis (carbon, oxygen, organic sulfur, hydrogen, and nitrogen), selected components of the proximate analysis (volatile matter and moisture), calorific value, reflectance of vitrinite, and the relative proportions of the 3 maceral groups (total vitrinite, inertinite, and liptinite group macerals). Faactor analyses performed on the entire data set and on subsets separated on the basis of rank, geographic location, and by cluster analysis indicated that rank is the most important factor in determining the amount of variation of each data set. The rank-dependent variables for the entire data set are carbon, reflectance, oxygen, volatile matter, calorific value, and moisture. The maceral groups account for the next greatest source of variation. Organic sulfur is independent of the first 2 factors and is the third most important source of variation. Cluster analyses indicated that the most significant partitioning produces 4 groups which are differentiated primarily on the basis of rank, maceral composition, and organic sulfur content. Factor analyses of the individual groups provide insights into the coalification processes of these more homogeneous coal associations.

19556 **(DOE/PC/30054—T1) Measurement of the physical structure of coal liquids by small-angle x-ray scattering. Final technical report, April 1, 1980-March 31, 1981.** Schmidt, P.W. (Missouri Univ., Columbia (USA). Dept. of Physics). 23 Feb 1983. Contract AC22-80PC30054. 18p. NTIS, PC A02/MF A01. Order Number DE83008113.

Heavy direct coal liquefaction products are known to exhibit rapidly increasing viscosities upon prolonged exposure to oxygen. Small angle x-ray scattering has been used to monitor changes in the colloidal structure of a coal liquid subjected to accelerated aging under an oxygen atmosphere for a total period of eight weeks. The data are consistent with an agglomeration model for the formation of large colloidal size scattering centers which are partially responsible for the rapidly increasing viscosity of the coal liquid. 2 figures.

19557 **(DOE/PC/30225—T4) X-ray diffraction and scattering studies of coal constituents. Semi-annual technical progress report, July 1, 1982-December 31, 1982.** Pavlovic, A.S.; Renton, J.J. (West Virginia Univ., Morgantown (USA). Dept. of Physics). 15 Jan 1982. Contract FG22-80PC30225. 16p. NTIS, PC A02/MF A01. Order Number DE83007490.

The general objective of this work has been to use x-ray diffraction and scattering to examine coal macerals and minerals in order to perform the following studies: (1) to identify and explain differences in vitrinites and framboids from various coals. (2) to correlate differences with basic coal composition and properties. (3) to determine the systematic variability in the micro compositional variation of macerals. During this past six months work has progressed mainly in looking at correlations of the x-ray diffraction characteristics and basic coal properties. The most serious problem is still the inability to obtain coal samples whose fundamental properties are known. Nevertheless, four samples of coals were obtained from Dr. Ira Goldberg of the Rockwell International Science Center. He has measured the aromaticity of these coals and found them to have aromaticity values lying between 70% and 75%. In order to obtain some results on coals outside these values of aromaticity, it will be necessary to perform NMR magic angle spinning experiments. The Fourier Transform X-Ray (FTXR) studies have been continuing. Correlations of some ultimate analysis results and more complicated functions of Fourier Transform characteristics have been found - also, some general conclusions about the effects of various coal parameters on the (FTXR) characteristics. The micro x-ray diffraction patterns obtained on several coals have shown a variety of characteristics. They indicate that within any one coal and maceral the constitutents will exhibit a different x-ray diffraction pattern. Finally, the studies of framboids have revealed some differences between various framboids; however, the broadening of the x-ray diffraction spots from the individual microcrystallites is very slight. This indicates a high degree of crystalline perfection and certainly very few defects. 7 figures, 2 tables.

19558 **(DOE/PC/30252—T9) Hydrogen bonding in asphaltenes and coal liquids. Quarterly report, November 1, 1982-January 31, 1983.** Li, N.C.; Yaggi, N.F.; Loeffler, M.C. (Duquesne Univ., Pittsburgh, PA (USA). Dept. of Chemistry). 1983. Contract AC22-80PC30252. 23p. NTIS, PC A02/MF A01. Order Number DE83006816.

Aging of upgraded coal-derived liquids obtained from catalytic hydroprocessing of H-coal and SRC-II syncrudes has been studied. Fuel degradation, in the presence of added specific heteroatomic compounds, is monitored in the early stages by laser light scattering of developing particles at ambient temperature. The following additives have been included: 2,5-dimethypyrrole (DMP), 2,6-dimethylquioline (DMQ), phenol, 2,6-di-tert-butyl phenol (DTBP), pyridine, thiophenol, n-butyl sulfide, n-butyl disulfide, thiophene, tetrahydrothiophene, 1-hexene, copper wire, iron wire. Very pronounced enhancement of light scattering intensity has been observed for coal liquids containing the following additives: (1) Phenol, pyridine, Cu; (2) DTBP, pyridine, Cu; (3) Phenol, DMQ, Cu; (4) DMP, thiophenol. Phenolic oxidative coupling is a very important mechanism for the aging of coal liquids, and pyridine- or DMQ- complexed Cu is effective catalyst for oxidative coupling. DTBP is a hindered phenol, and therefore oxidative coupling is not as extensive as for the parent phenol. As a result, light scattering for system (2) is not as extensive as system (1). DMP by itself is deleterious to fuel stability, and the effect is enhanced by the presence of thiophenol. Thiophenes, sulfides, and hexene are much less deleterious. Iron is a poor catalyst for oxidative coupling, and therefore light scatteirng in the presence of iron is minimal. 7 figures, 1 table.

19559 (DOE/PC/40787—7) **Enthalpy measurement of coal-derived liquids. Technical progress report, November 1982-January 1983.** Kidnay, A.J.; Yesavage, V.F. (Colorado School of Mines, Golden (USA). Dept. of Chemical and Petroleum Refining Engineering). 22 Feb 1983. 8p. NTIS, PC A02/MF A01. Order Number DE83007293.

The objective of this research is to measure the enthalpy for representative coal-derived liquids and model compounds over the pressure and temperature regions most likely to be encountered in both liquefaction and processing systems, and to prepare from the data an enthalpy correlation suitable for process design calculations. The correlational effort this past quarter on the enthalpy of coal-derived syncrudes and model compounds has emphasized the experimental determination of a correlating factor for association in coal liquids. As in previous work, the degree of association is to be related to cryoscopic molecular weight determinations on the coal liquids. To this end, work on and an evaluationof a cryoscopic molecular weight apparatus was completed this quarter. Molecular weights of coal liquids determined by the standard Beckman freezing point depression apparatus were consistently low (5 to 10%). After modifications of the apparatus, it was tested with the following compounds: hexane, dodecane, m-xylene and naphthalene. Benzene was the solvent used. However, the molecular weight measurements were again consistently lower than the true values, and in many cases the experimental error was greater than that of the Beckman apparatus.

19560 (DOE/PC/40803—T5) **Characterization of tar products from rapid pyrolysis of bituminous coals. Fifth quarterly progress report, October 1982-December 1982.** Suuberg, E.M.; Unger, P.E. (Brown Univ., Providence, RI (USA). Div. of Engineering). 1982. Contract FG22-81PC40803. 8p. NTIS, PC A02/MF A01. Order Number DE83007272.

We are presently focusing mainly upon the role of mass transfer in shaping the pyrolysis behavior of softening coals. The molecular weight distribution data obtained as part of this program have given us new insights into such processes. It is well known that tar yields are increased by factors which tend to increase the rate of escape of tars from the particle (e.g., performing the pyrolysis at reduced pressures, or using small particles). Increased rates of escape allow the tar precursor species less residence time within the particle, which means that they have less time to be reoplymerized into the char fraction of the particle. The newly obtained tar molecular weight distribution data have suggested the necessity of developing a model of pyrolysis which explicitly accounts for mass transfer limitations within the particle. These limitations most likely arise from liquid phase diffusional processes rather than pore diffusional processes. The implications of the presently analyzed data are summarized in a manuscript which is to be submitted to Fuel.

19561 (DOE/PC/40809—T5) **Separation of asphaltenes using high-resolution supercritical-fluid chromatography. Progress report, December 1, 1982-February 28, 1983.** Jackson, W.P.; Fjeldsted, J.C.; Richter, B.E.; Kuei, J.C.; Kong, R.C.; Lee, M.L. (Brigham Young Univ., Provo, UT (USA). Dept. of Chemistry). 1983. Contract FG22-81PC40809. 29p. NTIS, PC A03/MF A01. Order Number DE83008321.

During this period, the developed Supercritical-Fluid Chromatography (SFC) instrumentation was applied to the analysis of a vacuum still bottoms. Small diameter (50 to 100 μm i.d.) capillary columns were used to resolve mixture components, and scanning fluorescence detection provided selective detection and identification of many separated components. This report describes the initial attempts to combine the developments in column technology and SFC instrumentation which have been made during the past 18 months to the analysis of an actual high-molecular-weight coal-derived product. In addition, an evaluation of the stability of stationary phases resulting from crosslinking procedures has been made. The commonly used peroxides for free-radical generation also promote oxidation of the tolyl crosslinking groups which ultimately lead to decomposition of the phase and limited resistance to the solvating power of the supercritical fluids used in chromatography. Azo-compounds have been found to be effective in crosslinking, and do not promote oxidation. 23 figures, 2 tables.

19562 (DOE/PC/40810—4) **Synthesis of oligomeric models of coal derived materials for use with GPC calibration. Quarterly report, September 1982-November 1982.** Baltisberger, R.J.; Jones, M.B. (North Dakota Univ., Grand Forks (USA)). Dec 1982. Contract FG22-81PC40810. 13p. NTIS, PC A02/MF A01. Order Number DE83005664.

Analysis of two asphaltene and six preasphaltene samples have shown that 60 to 80% of the total oxygen is accounted for as phenol and carbonyl groups. Thus, ethers make up no more than 40% of the oxygen in these samples. Mofification of the proposed models, particularly the preasphaltenes, by incorporation of carbonyl moieties is therefore warranted. Thirty diaryl ethers and oligo(aryl oxides), both with and without phenolic OH groups, ranging from 186 g/mole to 538 g/mole have been synthesized as model asphaltenes. Preasphaltene models have been modified to include carbonyl groups (generally as quinones). The synthesis of the first of these new models has been accomplished and work on the preparation of other models is in progress.

19563 (DOE/PC/50807—T1) **Reaction calorimetry for coal chemistry and catalysis. Quarterly report, November 1, 1982-January 20, 1983.** Arnett, E.M. (Duke Univ., Durham, NC (USA). Dept. of Chemistry). 1983. Contract FG22-82PC50807. 19p. NTIS, PC A02/MF A01. Order Number DE83005826.

After several unsuccessful attempts to study coal reactions and adsorption of bases on solid acids with our previous calorimeter, we have deferred thermochemical measurements until all of the parts of our Setaram calorimeter have arrived and it is functioning. Most of this report describes some very encouraging studies comparing free energies of absorption for a variety of bases on several types of solid acids using thin layer chromatography. 6 figures, 2 tables.

19564 (EUR—7633-d,e,f,i, pp 44-61) **Metal impurities in coal liquids and their removal during hydroprocessing.** Wyss, W.F. 1982. Commission of the European Communities, Luxembourg.

In Round table meeting on chemical and physical valorisation of coal.

The two processes being developed by the NCB for the production of low-boiling distillates from coal both involve a preliminary solvent extraction of the coal, in one case by a high boiling hydrocarbon solvent recycled from the process itself (LSE) and, in the other, by a low-boiling solvent under supercritical conditions (SGE). In both cases, while the metals content of the extract is very small (generally less than about 0.1%), complete demetallization by filtration has not proved possible. Analysis of coals and filtered coal extracts has shown that a wide range of metals is transferred from coal to extract on extraction and that the proportion transferred differs with different metals. Investigation of a catalytic method of demetallization has yielded results that suggest that some at least of the metals in the extract are organically bound. An extensive investigation into the existence of organometallic complexes in coals and coal extracts has established the presence of gallium porphyrins in several British coals and in the extracts produced in the NCB liquefaction processes. While the concentration of proved organometallic complexes in the extracts is very small, it may be inferred that larger concentrations could exist but have remained undetected. (4 refs.)

19565 (EUR—7633-d,e,f,i, pp 200-217) **Analysis of coal tar oil by chromatographic methods.** Liphard, K.G. 1982. (In German). Commission of the European Communities, Luxembourg.

In Round table meeting on chemical and physical valorisation of coal.

For some years experimental coal hydrogenation plants have again been operated in the Federal Republic of Germany, e.g. at Bergbau-Forschung GmbH. Under coal tar oil process conditions, a distillate oil is obtained with a final boiling point of around 320-340 degrees C. The oil is separated by distillation into two fractions: light oil (boiling range up to 200 degrees C) and middle oil (boiling range above 200 degrees C). Coal tar oil represents an extraordinarily complex mixture necessitating preliminary separations to allow detailed analysis. This is illustrated diagrammatically for light and middle oils. Phenols and bases are separated off by liquid-liquid extraction with NaOH or H_2SO_4. These compounds are further analysed by capillary gas chromatography. The neutral oils thus obtained are divided into structural groups by a recently developed high-performance liquid chromatography method (HPLC). Coal tar oils from various coal feedstocks can be compared directly using this method. HPLC separation can also be carried out on a preparatory scale. Consequently individual fractions are available which can be more closely characterized by other methods, e.g. by gas chromatography. Some typical chromatograms are shown.

19566 (EUR—7633-d,e,f,i, pp 218-235) **Analytical methodology in studies of polycyclic aromatic hydrocarbons in coal derived products.** Grant, D.W. 1982. Commission of the European Communities, Luxembourg.

In Round table meeting on chemical and physical valorisation of coal.

The methods currently available for the analysis of polycyclic aromatic hydrocarbons (PAH) are discussed in relation to the kind of information that may become important in future legislation. High performance liquid chromatography (HPLC), operated in conjunction with UV or spectrofluorimetric monitoring, is considered to have advantages over other techniques within the present context because of its high selectivity towards geometric isomers and the well-defined and predictable specificity of the spectrofluorimetric techniques. The performances of normal and bonded reverse-phase columns are compared and it is concluded that, at the present stage of development, normal-phase adsorption columns, packed with microparticulate silica gel, give a better and more consistent resolution between the important isomers than the bonded reverse-phase columns. Also the addition of trace concentrations of acetone as a polar modifier to the n-hexane mobile phase enables the column selectivity to be adjusted appropriate to the type of separation required. This is exemplified by the separation of a number of important PAH including chrysene, benz(a)anthracene, and the six compounds specified in the WHO directive, for drinking water, namely fluoranthene, benzo(a)pyrene, benzo(ghi)perylene, benzo(k)fluoranthene, benzo(b)fluoranthene, and indeno(123,cd)pyrene. (36 refs.)

19567 (EUR—7633-d,e,f,i, pp 236-262) **Relationships between petrographic and chemical properties of Rhenish lignite.** Wolfrum, E.; Wawrzinek, J. 1982. (In German). Commission of the European Communities, Luxembourg.

In Round table meeting on chemical and physical valorisation of coal.

In developing new designs for lignite gasification, liquefaction and coking processes, it is necessary to achieve further improvements in process economy by optimizing the quality of the feedstock. In order to provide a more detailed description of the characteristics of Rhenish brown coal during valorization, detailed petrographic and chemical analyses were carried out. Correlation calculations enabled relationships between petrographic and chemical data to be determined. (5 refs.)

19568 **(ORNL/TM—8541) Coordination of physical, chemical, and thermodynamic properties for coal conversion: proceedings of the Oak Ridge conference.** (Oak Ridge National Lab., TN (USA)). Feb 1983. Contract W-7405-ENG-26. 118p. (CONF-8206158—Summ.). NTIS, PC A06/MF A01. Order Number DE83007169.

From Coordination of physical, chemical, and thermodynamic properties for coal conversion conference; Oak Ridge, TN, USA (2 Jun 1982).

A conference on Coordination of Physical, Chemical, and Thermodynamic (PCT) Properties for Coal Conversion was held at Oak Ridge, Tennessee, on June 2 to 4, 1982. The conference was sponsored by the Oak Ridge National Laboratory, using funds provided by the Department of Energy, Oak Ridge Operations (DOE-ORO). To facilitate the workshop format, the conference attendance was limited by invitation to about 42 participants. The format included: (1) a plenary session with presentations by respected government, industry, and academic leaders, each discussing their role in PCT properties data generation and dissemination, (2) workshops on the topics of data generation, data correlation, and uses of data, and (3) an open discussion to reach consensus viewpoints. The principal results of the conference were: (1) recognition that a centralized data bank of high quality is critical to large-scale coordination of coal conversion work, (2) an agreement that some form of quality assessment of the information to be included in the data bank is necessary, (3) a recommendation to form a National Steering Committee with working groups, and (4) a decision to send a letter on behalf of the conference attendees to Dr. Sun Chun, Director of the Pittsburgh Energy Technology Center (PETC), requesting the organization of a National Steering Committee. The conference organization and the ensuing results are discussed in detail in this report.

19569 **(PB—82-239997) Laser micropyrolysis of coal macerals. Annual report Oct 80-Sep 81.** Vastola, F.J. (Pennsylvania State Univ., University Park (USA). Dept. of Materials Science and Engineering). Oct 1981. 19p. NTIS, PC A02/MF A01.

The focused output of a 100 mj pulsed ruby laser is used to pyrolyze selected macerals of coal. The analysis of the pyrolysis products is accomplished by heating the coal in the ionization chamber of a time-of-flight mass spectrometer. A high speed data acquisition system has been designed to allow the recording of the spectra at rates up to twenty thousand spectra per second during the 1-5 ms pyrolysis period. The mass spectra obtained can be used to differentiate compositional variations in coal macerals as well as their alteration with rank.

19570 **(PB—82-241415) Review of needs for thermophysical property data on solid feedstocks: 1. coal. Final report.** Callanan, J.E. (National Bureau of Standards, Boulder, CO (USA). Inst. for Basic Standards). May 1982. 32p. NTIS, PC A03/MF A01.

In January 1981, a comprehensive survey was undertaken to determine the need for thermophysical properties of the following solid feedstocks/fuels: coal, oil shale, tar sands, gas hydrates. This report deals with that portion of the survey which concerns coal and includes the results of broad consultation with industrial, government, and academic groups as indicated. This survey shows the need for experimental work on heat of combustion, heat capacity/enthalpy, thermal conductivity, and heat of wetting for both well-characterized premium coal samples and for samples of the type which will be used directly in conversion processes. Widely accepted, standardized measurement techniques do not exist for these properties, with the exception of heat of combustion, and must be developed; in addition, reliable data must be generated for efficient use of coal as a feedstock. Theoretical studies which will allow for modeling of properties should proceed along with the experimental investigations to allow for improvement in prediction of coal properties for process design.

19571 **Physical structure of coal.** Grimes, W.R. (Oak Ridge National Lab., TN). pp 21-42 of Coal science. Volume 1. Gorbaty, M.L.; Larsen, J.W.; Wender, I. (eds.). New York, NY; Academic Press (1982).

Coal seems to consist of a network of clusters-held together by mechanisms that include occasional chemical cross-links. The clusters appear to be relatively small and consist of aromatic and hydroaromatic rings and condensed rings. The cross-linkages apparently consist at least in part of ether linkages, methylene groups, and some longer alkanes. Several methods were given for determining the porosity of coal. The internal surface area of coal is determined from (1) measurements of the heat generated when coal is treated with liquids, (2) determination of the quantities of adsorbed gases or vapors as functions of temperature and adsorbate pressure, and more recently, (3) by careful examination of scattering by x rays incident at very small angles. The internal surface of coal is largely associated with a micropore system in which 30 A (or smaller) diameter pores are constricted or linked by 5 to 8 A passages. The effects of heat on the pore structure, devolatilization and plastic behavior of coal were discussed. 110 references, 1 table. (DP)

19572 **Magnetic resonance studies of coal.** Retcofsky, H.L. (Pittsburgh Energy Tech. Center, PA). pp 43-82 of Coal science. Volume 1. Gorbaty, M.L.; Larsen, J.W.; Wender, I. (eds.). New York, NY; Academic Press (1982).

Electron spin resonance and nuclear magnetic resonance spectrometries have become extremely valuable tools in coal research. This work described was undertaken by the Pittsburgh Energy Technology Center. ESR and NMR provide valuable data that have led and will continue to lead to a better understanding of coal structure and how this structure is altered during the natural processes involved in coalification and during man-made processes for converting coal into more suitable fuels. ESR studies of respiratory-size mine dust appear to give little additional insight into the understanding of coal workers' pneumoconiosis. 20 figures, 9 tables. (DP)

19573 **Reductive alkylation reaction.** Stock, L.M. (Univ. of Chicago, IL). pp 161-279 of Coal science. Volume 1. Gorbaty, M.L.; Larsen, J.W.; Wender, I. (eds.). New York, NY; Academic Press (1982).

The chemical reduction of coal can be accomplished in several different ways. This review was primarily concerned with the reductive alkylation reaction and with other pertinent procedures such as reduction without alkylation and alkylation without reduction because, although many electrophilic reagents react rapidly with the coal polyanion, almost all of the research undertaken in this area has focused on the reactions of these anions with proton donors and with alkylating agents. All these reactions can provide a broad spectrum of information concerning the structural characteristics and reactivity of coal. 16 figures, 56 tables. (DP)

19574 **(ACIRL-PR—81-7) Development of a laboratory corona apparatus. Part 1.** Baker, J.W.; Smith, P.D. (Australian Coal Industry Research Labs. Ltd., North Ryde). Sep 1981. 58p. Australian Coal Industry Research Labs. Ltd., North Ryde.

A laboratory scale, point plant corona apparatus has been developed with the aim of producing voltage current corona characteristics which are similar to those found in a large scale pilot precipitator. The project was undertaken to enable corona characteristics to be obtained which were more interpretable than those obtained in an existing wire cylinder apparatus. A series of tests have been performed in the point plane apparatus with ten power station fly ashes. These tests have lacked repeatability and have not matched the pilot precipitator corona characteristics satisfactorily in most cases. Other properties of these fly ashes have been measured, particularly resistivity and carbon content, and correlation between these properties and corona characteristics were tested. An investigation showed that the lack of repeatability was due to variations in craters which form in the ash layer. The differences between point plane apparatus and pilot precipitator results also appear to be caused mainly by differences in crater formation. The point plane apparatus had a small measuring electrode where individual craters could have a dominant effect. In order to improve control of cratering and to avoid an individual crater having such a dominant effect the size of the electrode has now been increased twenty times. (15 refs.)

19575 **(BMFT-FB-T—81-102) Process for removing sulfur oxides from gases with direct production of a usable finished reaction product. Final report, October 1980.** Fischer, H.J.; Kremer, G. (Walther Cie A.G., Cologne (Germany, F.R.)). Jul 1981. 38p. (In several languages). NTIS, PC A03/MF A01.

Bundesministerium fuer Forschung und Technologie Sponsored by Bundesministerium fuer Forschung und Technologie.

During the described phase of testing, the waste-water-free Walther-process could be advanced considerably and tried in the final process conception after a coal-fired power-station block. The ammonia sulfate obtained as a waste-product, meets the requirements of the fertilizer industry. Further processing of this pulverous waste-product to obtain a marketable end-product was investigated and demonstrated in a pelletizing unit with subsequent drying in a drum-type drier. The possibility of reheating the gases in a FGD-plant (flue-gas desulfurization plant) without application of energy from foreign source was proven by the use of a regenerative heat exchanger. As regards spray-drying, a variant was investigated: a partial flow of the high-temperature flue-gas was branched before the airheater and spray-drying of the oxidized scrubbing liquid resulting from the desulfurization process was carried out in this partial flow.

19576 **(CONF-8205161—1) Pollution-control costs: a status report.** Witmer, F.E.; Livengood, C.D. (USDOE Assistant Secretary for Environmental Protection, Safety and Emergency Preparedness, Washington, DC. Office of the Deputy Assistant Secretary for Environment, Safety and Health; Argonne National Lab., IL (USA)). May 1982. Contract W-31-109-ENG-38. 19p. NTIS, PC A02/MF A01. Order Number DE83007679.

From International symposium on the economic aspects of coal pollution abatement technologies; Petten, Netherlands (24 May 1982).

The purpose of this study is to assess the economic, energy, and environmental impacts of possible New Source Performance Standards (NSPS) for 68 combinations of boiler size, emission standards, load factor, and combustion/control technologies. The results of the study show that Low-Btu gasification is not competitive with direct coal combustion for any level of control in the systems studied. The market for LBG technology will depend primarily on the availability and relative prices of petroleum and natural gas. Direct firing of low-sulfur coal is the least-cost option for Level-1 control and gives by far the lowest level of SO_2 emissions. However, AFBC is economically competitive with low-sulfur coal at the 75 and 150 million Btu/hr sizes (within the uncertainty of the estimates) and is more attractive than the other options. For Level-2 control, dry FGD was found to be competitive with wet FGD, but still more expensive than AFBC. Although dry FGD was not evaluated for high-sulfur-coal applications in this study, recent experience with a retrofitted spray dryer/fabric system at ANL has indicated that such systems should also be competitive for high-sulfur coals. At level 3, AFBC and wet FGD are the favored technologies for the larger boilers. SRC is nearly competitive at 150 and 75 million Btu/hr, and is clearly the economic choice at 30 million Btu/hr, especially for the lower load factor. Although SNG was not evaluated for the smaller boilers, it is expected to be competitive with SRC in those cases at the stringent control level. The most attractive technology options as determined by this study depend on boiler size, load factor, and level of control required. Direct combustion is favored for larger boilers, while coal-derived synfuels and petroleum-based fuels are most attractive for small boilers operating at low load factors. The systems approach to technology comparisons reveals important facets that would not be shown by narrowly focussed case studies.

19577 (DOE/EV/10367—27) **Experimental study of organically contaminated water in a cooling tower.** Goldstein, D.J.; Aiyegbusi, O. (Water General Corp., Cambridge, MA (USA)). 1 Dec 1982. Contract AC02-80EV10367. 66p. NTIS, PC A04/MF A01. Order Number DE83005645.

A pilot model cooling system was set up and run so as to simultaneously cool heat exchanger tubes and biologically degrade phenol in the makeup water. The cooling tower used 1 ft^2 by 3 ft high, wetted film, polygrid, PVC packing. Water was circulated at 2.5 gpm (5.6 ft/sec) through two parallel heat exchange tubes immersed in a water bath controlled at 150°F. Total water flow was 5 gpm/ft^2 of tower. Air was forced through the tower to give a liquid to gas mass ratio of 1.3. The cooling water circulated with an average temperature rise of 10°F and an average approach to the air wet bulb temperature of 12°F. Conclusions of this study are: (1) The pilot cooling tower was successfully operated to simultaneously cool and biodegrade phenol in the makeup water. Operation was not difficult and the experiments were reasonably reproducible. (2) An equivalent average concentration of phenol in the makeup water of 165 ppM (300 ppM BOD) should present little problem in commercial practice. An equivalent average concentration of up to 600 ppM phenol (1200 ppM BOD) may be acceptable in practice. Concentrations higher than 600 ppM phenol will cause such rapid biofouling and such rapid production of suspended solids in the circulating water as to be impractical. (3) More than 85 percent of the phenol removed was by biodegradation. Not more than 15 percent was stripped into the atmosphere. 12 figures, 12 tables.

19578 (DOE/METC—82-42-Vol.2) **Acid rain: control strategies for utility boilers. Volume II. Appendices.** (PEDCo-Environmental, Inc., Cincinnati, OH (USA)). May 1981. Contract AC21-81MC16361. 588p. NTIS, PC A25/MF A01. Order Number DE83006564.

These appendices provide a detailed breakdown of cost estimates for SO_2 and NO/sub x/ control strategies applied to the top 50 coal-fired SO_2/NO/sub x/ emitters as defined in the summary report: Acid Rain Control Strategies for Utility Boilers, Volume 1. Appendix A contains costs for the eastern and western low-sulfur coal strategies; Appendix B, costs for the 90% and 60% (partial scrubbing) SO_2 control attained through the use of wet flue gas desulfurization; Appendix C, costs for dry flue gas desulfurization (applicable to only three plants); and Appendix D, NO/sub x/ control costs for low-NO/sub x/ burners and overfire air. All costs are in 1980 dollars, and treatment of annual operating and maintenance and fixed charges is as uniform as possible to maximize comparisons on the same or similar basis.

19579 (DOE/METC—82-51, pp 181-185) **Treatment of coal gasification process wastewater.** Strakey, J.P. (Pittsburgh Energy Technology Center, PA). Sep 1982. NTIS, PC A10/MF A01.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

The availability of effective and economic environmental controls is required to enhance the utility of coal gasification technology. An area of major environmental concern is the wastewater produced by these processes. These wastewaters are considered to be complex in nature containing phenolic compounds, polynuclear aromatic compounds, ammonia, hydrogen sulfide, and numerous hazardous organic and inorganic pollutants. These wastewaters must be treated and the contaminants eliminated or reduced to acceptably low concentrations before discharge to the environment or reuse in the plant. Certain conventional wastewater treatment unit operations and processes are generally considered applicable to the treatment of coal conversion process wastewater. At present, no operating demonstration or commercial-scale coal conversion wastewater treatment facilities exist. Operating data from large-scale facilities are not available to determine the actual effectiveness and feasibility of the wastewater treatment unit operations and processes mentioned above in the treatment of coal conversion process wastewaters. In order to provide this information, bench-scale laboratory investigations have been conducted at PETC to determine the effectiveness of these environmental controls for coal gasification process wastewater and to obtain data useful in the design of large-scale facilities. The wastewater treatment program at PETC has provided data from bench-scale evaluations of various wastewater treatment unit operations and processes documenting the effectiveness of these environmental controls and providing useful information for the design of large-scale facilities.

19580 (DOE/METC—82-51, pp 188-189) **Environmental studies.** Paulson, L.E. (Grand Forks Energy Tech. Center, ND). Sep 1982. NTIS, PC A10/MF A01.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

The required level of treatment for gasification wastewater is dictated by its end use, which in the case of the Great Plains Gasification Project is the cooling tower. The extent of wastewater treatment needed to produce a satisfactory feed to the cooling tower is unknown; the environmental and economic risks are substantial. Great Plains proposes to process the wastewater by tar water separation, solvent extraction, and ammonia stripping and then feed to a cooling tower. Phenolic distribution coefficients for raw wastewater and a variety of solvents, including the two that apparently are used in commercial processes, were determined. Methyl isobutyl ketone (MIBK) showed the largest distribution coefficient for wastewater phenolics and was selected for use in subsequent studies. SFBG wastewater pretreated by solvent extraction and ammonia stripping was tested in activated sludge (AS) systems with and without addition of powdered activated carbon (PAC) at full strength. Effluent from PAC/As treatment was somewhat lower in TOC, COD, phenolics, organic nitrogen, and color than AS-treated alone. However, both AS- and PAC/AS-treated wastewater showed excellent reduction in extractable/chromatographable organics with effluents containing only low levels of relatively few compounds. The key to wastewater processing apparently lies in the solvent extraction for phenol recovery: when phenolics were reduced to the range of a few mg/1 by solvent extraction, most wastewater organic contaminants - both aqueous and suspended phase - were reduced to detection limits. Solvent-extracted wastewater did not require dilution prior to biological treatment, and had less tendency to foam and a lower COD, TOC, and color than did a similar sample diluted to the same phenolic level.

19581 (DOE/METC—82-51, pp 190-193) **Advanced process development for wastewater treatment processes.** Genung, R.K. (Oak Ridge National Lab., TN). Sep 1982. NTIS, PC A10/MF A01.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

The project has two tasks. The objective of the first task is to develop and evalute a fixed-film, fluidized-bed bioreactor as a biooxidation process for use in coal conversion wastewater treatment systems. Work includes the definition of process design parameters, the identification and evaluation of operating parameters to be used for process control, and the demonstration of steady state operaton for extended periods. The objective of the second task is to develop a process flow diagram and an associated R & D plan for a mobile wastewater treatment process demonstration unit containing selected unit operations. The new bioreactors technology has the potentail for having significant advantages over technologies such as the activated sludge process or the rotating biological contactor conventionally used for biooxidation. The concepts being exploited in this development include the following: use of inert support particles to confine films of active biomass within a continuous-flow bioreactor; development of significantly higher active-biomass-to-reactor volume ratios than those obtained in conventional systems; use of reactor geometries that optimize hydraulic behavior; and use of closed-reactor systems to minimize the environmntal and health impacts associated with vapors and aerosols produced from open-air biooxidation systems. The purpose of the second task is to develop iformation that could be used to guide the future development and execution of a field wastewater treatment R & D program based on unit operatons of a scale adequate to produce credible design and cost data. Information produced will include recommendations for process selection, estimates of construction and operationg cost, and a basic outline for essential R & D activities.

19582 (DOE/METC—83-51, pp 5-16) **Particulate sampling from a high temperature and high pressure process stream.** Wegrzyn, J. (Brookhaven Natonal Lab., Upton, NY). 1981. NTIS, PC A18/MF A01.

From DOE contractor's workshop on particulate sampling and characterization; Morgantown, WV, USA (16 Jun 1981).

Sampling from a coal process stream poses many unique problems for the investigator in obtaining representative data. A brief overview of same of these problems, along with possible solutions, are discussed. In particular, problems of the definition of an irregular type particle, flow measurement and control, characterization of the process stream, and preservation of the sample are reviewed in terms of their impact on the design features of an extractive sampling probe. It is argued that these problems are varied and complex, and only through multi-comparison tests of all types of particulate detectors can the particulate phase from the combustor to the turbine be characterized with any level of confidence.

19583 (DOE/METC—83-51, pp 98-112) **Impactor data analysis for high temperature-high pressure aerosol sampling.** Cheng, Y.S.; Newton, G.J.; Carpenter, R.L. Barr, E.B.; Yeh, H.C. (Lovelace Biomedical and Environmental Research Inst., Albuquerque, NM). 1981. NTIS, PC A18/MF A01.

From DOE contractor's workshop on particulate sampling and characterization; Morgantown, WV, USA (16 Jun 1981).

Samples collected at high tempertures and pressures in gases other than air cannot be characterized using impactor stage characteristics measured in air at ambient conditions. This paper describes a method of translating the impactor stage characteristics under ambient conditions to the sampling conditions found during HTHP sampling of low Btu coal gas.

19584 (DOE/METC—83-51, pp 201-230) **Fine particulates behavior in species concentration and temperature gradient fields.** Mahalingam, R. (Washington State Univ., Pullman, WA). 1981. NTIS, PC A18/MF A01.

From DOE contractor's workshop on particulate sampling and characterization; Morgantown, WV, USA (16 Jun 1981).

The overall objective of this study is to investigate the effects of trace species and temperature and gas phase concentration gradients influencing transportation mechanisms in organic aerosols, simulating tars. The results will be applicable in the development and evaluation of sampling strategies and batch and real-time monitoring instrumentation development, for gas streams from gasifiers and fluidized bed combustors. Additionally, the results will be useful in formulating control strategy, technology, and control equipment. An experimental unit, capable of generating aerosol streams whose output and size distribution are constant and a reproducible, has been set up. The unit consists of an aerosol generator, a dilution chamber, a charge neutralizer, a set of cyclones and replaceable test sections of various geometries and controllable parameters. Monitoring across the test section is with Nuclepore filters, cascade impactors, condensation nuclei counter, diffusion battery, and electrical aerosol analyzer. In the runs carried out till now, the test sections used in the experimental unit are straight sections of 0.305" i.d. and 2' and 7' long stainless steel tubes, to simulate the probes typically used in a gasifier. The evaluation, however, has been under ambient isothermal conditions. Both methylene blue and dioctyl phthalate aerosols, in the size range 0.03 to 3 μm, have been used in these runs. The aerosol loadings have been in the range 0.001 to 2.0 g/m^3, the capacity of the unit being up to 4 g/m^3. Both laminar and turbulent flows have been evaluated. These results show that there is negligible deposition and size redistribution, as to be expected; also, these results establish baseline conditions for subsequent phase of the investigation.

19585 (DOE/METC—83-51, pp 241-255) **New instrument for isokinetic sampling in high temperature stacks and ducts.** Nelson, P.A. (TSI Inc., St. Paul, MN). 1981. NTIS, PC A18/MF A01.

From DOE contractor's workshop on particulate sampling and characterization; Morgantown, WV, USA (16 Jun 1981).

A new commercially available in-situ instrument for particle sampling is described. Its unique characteristic is its ability to isokinetically sample and collect from a moving gas stream over wide ranges of temperature and velocity. The sampler is of a fixed design and does not require variable flow pumps nor varying inlet areas to maintain the isokinetic characteristic. Rather, it is accomplished through the aerodynamic design. The collection mechanism is electrostatic precipitation. The collection efficiency has been studied under changing operating parameters and is reported.

19586 (DOE/METC—83-51, pp 256-270) **New particle sizing impactor for heavy grain loading.** Smith, M.L. (Andersen Samplers Inc., Atlanta, GA). 1981. NTIS, PC A18/MF A01.

From DOE contractor's workshop on particulate sampling and characterization; Morgantown, WV, USA (16 Jun 1981).

Classical impactors have mass loading limits in the range of 2 to 10 milligrams per stage, which prove impractical to use in gas streams where the loading is greater than 2 grams/m^3. The Anderson high-capacity stack sampler is a 3-stage impactor that does allow sampling of stack gases under these conditions. Two impaction stages are followed by the third-stage cyclone followed by a glass fiber thimble filter. The cyclone stage can have either a 1.5 micron or a 2.5 micron cutpoint. Calibration curves are shown, and the performance tests are described. It is constructed of type 316 stainless steel and has no rubber components so it will withstand temperatures of 1200°F for long runs or 1500°F for shorter runs without the glass fiber filter. It is not designed for large pressure drops, so the internal and external pressure would have to be equalized before using in a high pressure stack. (CKK)

19587 (DOE/METC—83-51, pp 271-301) **On-line particle sizing.** VanValkenburg, E.S. (Leeds & Northrup Co., North Wales, PA). 1981. NTIS, PC A18/MF A01.

From DOE contractor's workshop on particulate sampling and characterization; Morgantown, WV, USA (16 Jun 1981).

Leeds & Northrup Company has developed and commercialized several light scattering instruments for continuous on-line measurements of particle size and concentration in liquid or gas streams. These instruments enable rapid characterization of the size distribution of solid particles and droplets by analysis of all particles crossing a laser beam. Whereas other light scattering instruments resolve individual particles and sort data according to size measurements, our method involves collecting instantaneous data from large numbers of particles and characterizing their size distribution from the composite diffraction patterns. This method enables measurement of particles from 0.1 to 1000 micrometers in diameter over large volumetric ranges and independent of refractive index. This type of instrumentation is being used extensively in industrial milling, blending and inspection processes, and special instruments have been deveoloped for measuring particles in energy conversion processes. This presentation elaborates on its applications to measuring particle loadings in high temperature/pressure gas streams of fluidized-bed combustion systems and for monitoring particles in emissions from stationary stacks.

19588 (EPRI-CS—2809) **Electrostatic-precipitator reference manual. Final report.** Gallaer, C.A. (Gallaer (C.A.), Pittsburgh, PA (USA)). Jan 1983. 432p. NTIS, PC A19/MF A01. Order Number DE83901468.

This manual is designed to familiarize the reader with the application of electrostatic precipitators (ESPs) to the collection of fly ash produced by steam boilers in the electric power industry. It is intended to be used by utility engineers who have had little or no previous background or experience in the control of fly ash emissions. The report summarizes the history and theory of electrostatic precipitation and contains an outline of steam boilers and their production of fly ash. The chemical and physical properties of fly ash are discussed in depth with emphasis upon the effects of these properties upon ESP performance. Practical guides for the selection of ESP design and size are given, along with examples of commercial and technical aspects of equipment specifications. Sections are included covering the construction, operation, and maintenance of ESPs. Special attention is given to operating and performance problem diagnostics (trouble-shooting). The report concludes with a discussion of future trends in the design and application of ESPs to electric generating plants. The manual is published in loose-leaf format to facilitate its updating as additional material on the state-of-the-art becomes available. Its organization and emphasis are the result of its writers' many years of practical experience with ESPs.

Its content is mainly derived from the voluminous literature on the subject indicated in the reference list. The initial effort coordinates and/or references some twenty EPRI research projects and ninety other published books and papers. This manual will be supplemented by guidelines which deal specifically with: (1) ESP sizing and design; (2) ESP detail specifications; (3) ESP trouble-shooting; and (4) ESP upgrading. 53 figures, 2 tables.

19589 (EPRI-CS—2817) **Preliminary evaluation of the Avco-Ebara FGT process. Final report.** Troupe, J.S. (Bechtel Group, Inc., San Francisco, CA (USA)). Jan 1983. 108p. NTIS, PC A06/MF A01. Order Number DE83901453.

This report evaluates the technical and economic feasibility of applying the Avco-Ebara flue gas treatment process to coal-fired electric utility steam generators. The technical assessment addresses the process chemistry, historical development, critical process parameters, areas requiring further development, safety and environmental concerns, and the readiness for commercialization of the process. Process design criteria are developed for a hypothetical generating station having two 500 MW units, and a conceptual design for applying the Avco-Ebara process at that station is developed and described. The major conclusions drawn from this study are: (1) the proposed flue gas treatment process is technologically feasible; (2) simultaneous removal of sulfur oxides and nitrogen oxides is possible at high efficiencies; (3) the flue gas treatment process is safe and has no adverse impact upon the environment; (4) electron-beam generation equipment large enough for use in the process is being designed, but has not yet been commercially manufactured; (5) a 10 MW process demonstration unit being implemented by the co-developer of the process is a critical step in the orderly evolution to large-scale utility use; (6) under present conditions, requiring no postcombustion NO/sub x/ control, a $48/ton return for the by-product (above transportation costs) is needed to equal the 30-year levelized revenue requirement for a wet limestone scrubbing alternative; and (7) if postcombustion NO/sub x/ control involving between 70 and 80 percent removal were required, the process, without any return for the by-product, could provide as much as a 25 percent savings in the 30-year levelized revenue requirement for an alternative of wet limestone scrubbing combined with selective catalytic NO/sub x/ reduction.

19590 (EUR—7633-d,e,f,i, pp 263-282) **Some aspects of the application of activated carbon for waste water treatment.** Berends, J. 1982. Commission of the European Communities, Luxembourg.

In Round table meeting on chemical and physical valorisation of coal.

The most important parameters which are relevant for the use of activated carbon in waste water treatment are reviewed. For a number of carbon grades from different origins, the structure, surface chemistry and resistivity against oxidation were examined. Experiments were carried out for a certain number of potential applications of activated carbon treatment. In the treatment of pesticide-plant waste water, selective adsorption of persistant substances was found. Melamine waste water could be treated in an adsorption-desorption process, although recovery of the melamine was not possible. From acrylonitrile waste water selective adsorption of one component was found, which could be recovered from the carbon.

19591 (NP—3901156) **Disposal of excess spoil from coal mining and the Surface Mining Control and Reclamation Act of 1977: a study of regulatory requirements, engineering practices, and environmental protection objectives.** (National Research Council, Washington, DC (USA). Committee on Disposal of Excess Spoil). 1981. 218p. National Academy Press, 2101 Constitution Avenue, N.W., Washington, DC 20418.

The objectives of the study were to conduct a nationwide review of engineering practices and physiographic and environmental conditions that have an impact on the disposal to excess spoil from surface and underground mining of coal and to evaluate the rationale for promulgating OSM regulations in the form of general guidelines, detailed engineering standards, or a combination of both. Chapter 3 deals with the history of the issues at hand-the earlier attempts by Congress to deal legislatively with the disposal of excess spoil, the enactment of SMCRA, and the concerns of OSM as it wrote its regulations. Chapter 4 quotes the OSM regulations pertaining to the disposal of excess spoil, presents the Committee's analysis of each of these regulations, and evaluates the costs of disposing of excess spoil. OSM's regulations pertaining to the hydrologic impacts of excess spoil fills are analyzed and pre-SMCRA state regulatory requirements are compared with the initial SMCRA regulatory requirements. Chapter 5 presents an alternative approach developed by the Committee and includes brief discussions of the regulatory approaches used by the Mine Safety and Health Administraton, the Environmental Protection Agency, and the US Geological Survey. Chapter 6 is a discussion of the characteristics of excess spoil and of excess spoil disposal areas, and of certain hazards in spoil disposal areas, such as land erosion and landslides. Chapter 7 deals with the environmental impacts of excess spoil, that is, its potential effects on water, air, land, and fish and wildlife in the vicinity of the spoil. Chapter 8 discusses engineering practices used in disposing of, and minimizing the environmental and other impacts of, excess spoil. Special attention is paid to the design of spoil disposal facilities, to the drainage of excess spoil embankments, and to the revegetation of excess spoil fills and embankments.

19592 (PB—82-227729) **Recovery of calcium carbonate and sulfur from FGD scrubber waste. Final report Aug 77-Apr 78.** Arganbright, R.P.; Huang, P.; Benner, G.S.; Mandelik, B.G.; Roche, T.S. (Kellogg (M.W.) Co., Houston, TX (USA)). Apr 1982. 143p. NTIS, PC A07/MF A01.

The report gives results of a demonstration of key process steps in the proprietary Kel-S process for recovering calcium carbonate and sulfur from lime/limestone flue gas desulfurization (FGD) scrubber waste. The steps are: reduction of the waste to calcium sulfide (using coal as the reducing agent), carbonation of the calcium sulfide to generate hydrogen sulfide and calcium carbonate, and recovery of precipitated calcium carbonate from inerts (coal ash).

19593 **Field test results of eighteen industrial coal stoker fired boilers for emission control and improved efficiency. Paper 81.35.3.** Axtman, W.; Eleniewski, M.A. (Am Boiler Manuf Assoc, Arlington, VA, USA). *Proceedings, Annual Meeting, Air Pollution Control Association;* vp(1981). (CONF-810631—).

From 74. annual meeting of the Air Pollution Control Association; Philadelphia, PA, USA (21 Jun 1981).

Results of test program are given of average data monitored on flue gases from coal-burning boiler and stoker equipment. Performances are dependent upon many variables such as fuel properties and operating procedures.

0109 Environmental Aspects

REFER ALSO TO CITATION(S) 19499, 19501, 19505, 19506, 19537, 19538, 19591, 19614, 19645, 21194, 21707, 21865, 21868, 21881

19594 (ANL/EES-TM—206) **Data for intermodal comparison of environmental impacts of inland transport alternatives for coal energy.** Bertram, K.M.; Tobin, R.L. (Argonne National Lab., IL (USA)). Mar 1981. Contract W-31-109-ENG-38. 136p. NTIS, PC A07/MF A01. Order Number DE83007577.

This report summarizes coal energy tranportation alternatives and their environmental effects. The data presented allow comparison of the alternatives and are easily scaled to give the environmental effects for specific cases. Environmental effects that are difficult to quantify are presented in descriptive form. Regional data and regulatory information on air quality, water quality, and land use allow the generic environmental effects to be applied to site-specific analyses. An example of such an analysis is included.

19595 (CONF-821175—1) **Subsurface oxidation of pyritic coal-cleaning wastes by chemoautotrophic bacteria.** Schubert, J.P.; Miller, R.M. (Argonne National Lab., IL (USA)). Nov 1982. Contract W-31-109-ENG-38. 19p. NTIS, PC A02/MF A01. Order Number DE83007965.

From Symposium on surface mining hydrology, sedimentology, and reclamation; Lexington, KY, USA (1 Nov 1982).

The presence of the iron-oxidizing bacterium Thiobacillus ferrooxidans was investigated in groundwater and surface water at two coal refuse disposal sites in southwestern Illinois. Piezometers placed in the saturated bases of reclaimed and unreclaimed refuse piles showed high populations of the bacteria. The reclaimed pile had lower populations than did the unreclaimed coal refuse, suggesting that the reclamation effort may have caused a decline in subsurface Thiobacillus population levels. Acidic runoff water from the two piles also contained T. ferrooxidans but the levels encountered are not as high as those found in the saturated bases. Population levels of T. ferrooxidans were not high in till below the gob pile or in slurry material at the Staunton site. This may be attributed to the lower acidity and dissolved iron concentrations in groundwater at these locations, as well as to the lack of pyrite in the till and slurry material. Statistical analysis of T. ferrooxidans populations and six water quality variables for runoff and groundwater samples from the two sites showed that all seven variables were significantly intercorrelated. More samples and additional variables must be evaluated before cause/effect relationships can be determined. High populations of T. ferrooxidans were found in the saturated bases of the two refuse piles, despite low levels (< 0.5 mg/L) of dissolved oxygen. If these bacteria can catalyze pyrite oxidation under the conditions present, reduction of acid formation by refuse burial may not be successful.

19596 **(DOE/ET/10143—T30) H-Coal Pilot Plant: surface- and ground-water monitoring program for H-Coal solid-waste storage and disposal site, E and H-11.** Gray, J.H. (Ashland Synthetic Fuels, Inc., KY (USA)). Dec 1982. Contract AC05-76ET10143. 54p. NTIS, PC A04/MF A01. Order Number DE83006750.

Operation of the H-Coal Pilot Plant causes solid wastes and process by-products to be produced. This report discusses the impact of two materials, filter cake and flaked residuum, on a disposal site. The filter cake is the dewatered biological solids from the wastewater treatment plant and the flaked residuum is a process by-product from the vacuum tower bottoms. The H-Coal solid waste storage and disposal site is located 15 miles south of the plant in Lawrence County, Kentucky. The large 274 acre licensed landfill was modified to create a 7 acre surface storage area for the flaked residuum and a 1 acre landfill area for the filter cake. Leachate testing showed the two materials to be non-hazardous by standards found in the Resource Conservation and Recovery Act. The H-Coal project still elected to monitor the surface and ground water at the site to determine what impacts, if any, were exerted by the two materials. Both the State of Kentucky and US Environmental Protection Agency Region IV located in Atlanta, Georgia have classified the wastes as non-hazardous. Analyses of the surface and ground waters show no environmental impact due to the landfill and surface storage operation.

19597 **(DOE/ET/14146—2) Mining/reclamation handbook project. Final technical report, September 1980-February 1983.** Sendlein, L.V.A. (Southern Illinois Univ., Carbondale (USA). Coal Extraction and Utilization Research Center). Feb 1983. Contract AC22-80ET14146. 16p. NTIS, PC A02/MF A01. Order Number DE83008366.

This document contains a report on the development of a Surface Mining Environmental Monitoring and Reclamation Handbook. The purpose of the book was to provide mine operators with cost-effective techniques for compliance with monitoring requirements of the Surface Mining Control and Reclamation Act of 1977 (PL 95-87). The monitoring requirements of PL 95-87 were identified and categorized into eight subject areas. These subject areas, which became the focus of the Handbook chapters, included the following: geology, hydrology, reclamation, air quality, blasting, fish and wildlife, archeological and historic resources, and subsidence. The chapter manuscripts were prepared by a team of experts representing government, industry, and academia. The Handbook will be published by Elsevier Scientific Publishing Co., Inc. in late 1983. A bibliography developed during the course of the project is available from the National Technical Information Service (NTIS).

19598 **(MST-LUFT-A—52) Annual report for 1981.** (Miljoestyrelsen, Roskilde (Denmark). Luftforureningslab.). Mar 1982. 40p. (In Danish). Miljoestyrelsen, Roskilde, Denmark.

Activities of the Danish Air Pollution Laboratory of scientific and administrative character are listed. Two large projects 'Operational Meteorological Air Quality models' and 'National Air Quality Measuring program' are prepared, cooperation with municipal and meteorological authorities is in progress. Staff publications are listed. (Available from Miljoestyrelsens Luftforureningslaboratorium, Risoe DK-4000 Roskilde, Denmark) (In Danish)

19599 **(NP—3901160) Coal mining and ground-water resources in the United States.** (National Research Council, Washington, DC (USA). Committee on Ground-Water Resources in Relation to Coal Mining). 1981. 212p. National Academy Press, 2101 Constitution Avenue, N.W., Washington, DC 20418.

The purpose of this report is to examine the expansion and geographical redirection of coal mining now occurring in the United States, its effects on ground water, and the environmental and socioeconomic impacts of those effects. The report addresses ground-water use, ground-water supplies and availability, principles that govern the functioning of hydrogeologic systems, and the institutional framework for ground-water allocation. Because of the geological, hydrological, climatic, and water-rights differences between the eastern and western United States, the study includes separate examinations of the specific ground-water implications of coal mining in both regions. The report addresses all coal mining technologies, including surface mining, underground mining, and underground coal gasification. However, it does not include ground-water effects that may result from transportation or consumption of coal or from any other coal-related activity, unless that activity is an integral part of operations at the mine site. This report describes how methods of coal extraction may affect ground water and assesses methods for mitigating adverse effects during and after mining. The report appraises the state of knowledge within the discipline of hydrogeology. Mining affects both ground-water quantity and quality. The effects of mining on ground-water levels and flow normally occur quickly and can be identified and monitored. Equilibrium in ground-water levels and flow regimes is often readily reestablished, but changes in ground-water quality can be long lasting and difficult to reverse. Furthermore, the exact nature of future ground-water quality degradation as a result of mining cannot always be anticipated. Some effects of mining cannot be identified until long afterward, and this time lapse makes mitigation difficult.

19600 **(PB—82-222910) Environmental assessment of coal cleaning processes. Final report Jul 76-Sep 79.** Lemmon, A.W. Jr; Robinson, G.L.; Rogers, S.E.; Van Voris, P. (Battelle Columbus Labs., OH (USA)). Apr 1982. 116p. NTIS, PC A06/MF A01.

The report summarizes a 3-year evaluation of coal cleaning processes. It discusses: physical coal cleaning (PCC) technology; the potential role of PCC in producing coals for compliance with SO2 emission regulations; pollution controls for PCC plants; assessment criteria and test methods for environmental testing at PCC plants; and baseline environmental tests at the Homer City coal preparation plant.

19601 **(PB—82-222936) Coal gasification/gas cleanup test facility: volume ii. environmental assessment of operation with devolatilized bituminous coal and chilled methanol. Final report Sep 80-Apr 81.** Ferrell, J.K.; Felder, R.M.; Rousseau, R.W.; Ganesan, S.; Kelly, R.M. (North Carolina State Univ., Raleigh (USA). Dept. of Chemical Engineering). Apr 1982. 190p. NTIS, PC A09/MF A01.

The report gives results of initial runs of a pilot-scale coal gasification and gas cleaning plant at North Carolina State University. In these runs, a devolatilized Western Kentucky No. 11 bituminous coal was gasified with steam and oxygen, and chilled methanol was used as the acid-gas removal solvent. Material balances were obtained for major elements and trace elements judged to be both volatile and environmentally hazardous. Emissions of sulfur gases in the various plant effluent streams were also measured.

19602 (PB—82-225855) Synthetic fuels development: earth-science considerations. Rickert, D.A.; Ulmam, W.J.; Hampton, E.R. (Geological Survey, Reston, VA (USA)). 1979. 53p. NTIS, PC A04.

This report provides basic information on the natural resources required for synfuel production and briefly describes some of the possible geologic and hydrologic considerations. No attempt is made to address the social, economic, air-quality, and secondary environmental effects that would result from the large-scale production of synfuels.

19603 (PB—82-258476) Procedures for predictive analysis of selected hydrologic impacts of surface mining. Final report Sep 76-Sep 81. McWhorter, D.B. (Colorado State Univ., Fort Collins (USA). Dept. of Agricultural and Chemical Engineering). Aug 1982. 98p. NTIS, PC A05/MF A01.

This report presents a methodology for the prediction of selected hydrologic impacts of surface coal mining. Procedures for estimation of the chemical and hydrologic parameters required by an algebraic water quality model are provided. The model predicts the long term mean dissolved solids concentration in combined direct and sub-surface runoff from a watershed partially disturbed by mining. The computational procedure is demonstrated in a step-by-step calculation for a mine site in Colorado. The predicted results are in satisfactory agreement with short term (2 and 3 year) observations. Procedures for determining the transmissivity of coal and overburden aquifers from single-hole aquifer tests are provided. The procedures permit the analysis of recovery data, affected by well-bore storage, following a prolonged pumping period. Well-bore storage is an important effect in the recovery of low transmissivity aquifers often encountered in coal mining related hydrology.

19604 (PB—83-114884) Selective placement of strip mine overburden in Montana. V: summary report. Open file report Jul 76-Jun 81. Dollhopf, D.J.; Goering, J.D.; Levine, C.J.; Bauman, B.J.; Hedberg, D.W. (Montana State Univ., Bozeman (USA). Agricultural Experiment Station). Jun 1981. 211p. NTIS, PC A10/MF A01.

The objective of this study was to investigate the means of establishing nonpolluted ground water and root zone systems in areas where surface mining intercepts physiochemically unsuitable overburden materials. Overburden may need to be sampled on a 60-m grid to delineate materials unsuitable for reclamation and to accurately implement selective handling operations. After 3 years the buried material remains above the reestablished aquifer and below the root zone. At least a portion of the postmine aquifer had hydraulic conductivity rates lower than the premine system, indicating the reestablished aquifer may, in part, conduct ground water very slowly. Postmine ground water chemical quality in spoil materials had poorer quality compared with premine ground water.

19605 Environmental emissions from emerging coal technologies. Paper 81.3.1. Headley, L.C.; Bajura, R.A. (US DOE, Morgantown, WV, USA). *Proceedings, Annual Meeting, Air Pollution Control Association;* vp(1981). (CONF-810631—).

From 74. annual meeting of the Air Pollution Control Association; Philadelphia, PA, USA (21 Jun 1981).

An assessment of the expected environmental emission levels caused by the probable increase of using more coal as a fuel in the future is presented. Coal will be a major domestic energy resource in the United States both for direct burning to make electric power and heat and for gasification and liquefaction. The effects of the increased levels of sulfur dioxide, nitric oxides and particulate emissions on the environment are evaluated. 14 refs.

19606 Airborne size distributions of trace elements in an industrial section of Pittsburgh. Paper 81.28.6. Davidson, C.I.; Goold, W.D.; Nasta, M.A.; Reilly, M.T. (Carnegie-Mellon Univ, Pittsburgh, PA, USA). *Proceedings, Annual Meeting, Air Pollution Control Association;* vp(1981). (CONF-810631—).

From 74. annual meeting of the Air Pollution Control Association; Philadelphia, PA, USA (21 Jun 1981).

In this study, airborne trace element size distribution, measured in an industrial area of Pittsburgh, Pennsylvania are reported. Crustal enrichment factors as a function of particle size are calculated for Al, As, Ba, Cd, Cu, Fe, Ni, Pb, V, and Zn, in order to assess differences between composition of aerosol and that of the earth's crust. 49 refs.

19608 (DOE/ET/12548—16) Automation of the longwall mining system. Zimmerman, W.; Aster, R.; Harris, J.; High, J. (Jet Propulsion Lab., Pasadena, CA (USA)). 1 Nov 1982. Contract AI01-76ET12548. 112p. (JPL-PUB—82-99). NTIS, PC A06/MF A01. Order Number DE83007267.

The longwall automation study presented is the first phase of a study to evaluate mining automation opportunities. The objective was to identify cost-effective, safe, and technologically sound applications of automation technology to understand coal mining. The prime automation candidates resulting from the industry experience and survey were: (1) the shearer operation, (2) shield and conveyor pan-line advance, (3) a management information system to allow improved mine logistics support, and (4) component fault isolation and diagnostics to reduce untimely maintenance delays. A system network analysis indicated that a 40% improvement in productivity was feasible if system delays associated with all of the above four areas were removed. A technology assessment and conceptual system design of each of the four automation candidate areas showed that state-of-the-art digital computer, servomechanism, and actuator technologies could be applied to automate the longwall system. The final cost benefit analysis of all of the automation areas indicated a total net national benefit (profit) of roughly $200 million to the longwall mining industry if all automation candidates were installed. This cost benefit represented an approximate order of magnitude payback on the research and development (R and D) investment. In conclusion, it is recommended that the shearer operation be automated first because it provides a large number of other sensor inputs required for face alignment (i.e., shields and conveyor). Automation of the shield and conveyor pan-line advance is suggested as the next step since both the shearer and face alignment operations contributed the greatest time delays to the overall system downtime.

19609 (DOE/ET/14180—T1) Acme Miner Bolter: design, assembly, and field testing. Final technical report, September 30, 1979-March 31, 1982. Myers, S.L. (Acme Machinery Co., Huntington, WV (USA)). Jan 1983. Contract AC01-80ET14180. 110p. NTIS, PC A06/MF A01. Order Number DE83006382.

The purpose of this report is to convey information and data concerning the manufacture, surface and underground testing of the Acme Miner Bolter under the Department of Energy Contract No. DE-AC01-80ET14180. The manufacture of the A.M.B. was completed in March 1982; and the machine was shipped to the DOE test facility in Bruceton, Pennsylvania, to undergo surface testing by cutting on a block of coalcrete in the Cutting Trials Area and taking data of the various functions. After completing the surface testing in May 1982, the A.M.B. was shipped to R and P Coal Company's Urling No. 3 Mine to undergo underground testing. primarily the A.M.B. was to mine 150 tons of coal per shift for five consecutive shifts. The A.M.B. satisfactorily completed this test on November 4, 1982. The general consensus of the people involved with the testing of the A.M.B. was that it was a valid coal mining concept. They also felt it should be further developed to obtain a production model.

19610 **(DOE/OR/20807—T1-Vol.2C) Tri-State Synfuels Project Commercial Scale Coal Test: Volume 2C. Collection and shipment photographic review.** (Tri-State Synfuels Co., Houston, TX (USA)). Jun 1982. Contract FC05-81OR20807. 94p. NTIS, PC A05/MF A01. Order Number DE83007444.

This report is a photographic review of the collection and shipment phase of the project during February through April 1981. It covers the locations at Morganfield and Uniontown, Kentucky; Darrow, Louisiana; and Port Elizabeth and Sasolburg, Republic of South Africa. The final detailed program planning and tour of the mine, belt and barge loading facilities occurred on February 11 and 12 (Section 2.0). The coal was ampled and selected from the Camp 1 mine at Morganfield (Section 3.0) and transported on the nine-mile conveyor belt to Uniontown, February 23-25 (Section 4.0). The coal was inspected and loaded at Uniontown on a 15-barge tow, February 23-25, for the 900-mile trip on the Ohio and Mississippi River systems to Darrow (Section 5.0). The barges were inspected and top sampled prior to transloading the bulk carrier M.S. Bonita at Darrow during March 17-20 for shipment to Port Elizabeth (Section 6.0). The ship was offloaded and rail cars sampled April 15-24 at Port Elizabeth before leaving for Sasolburg (Section 7.0). The rail cars were offloaded and partially sampled and trucked to Sasolburg in late April and stockpiled until the gasification test program started in July. After the July and September phases of the coal test, the remaining stockpile was relocated and compacted prior to the November tests to prevent spontaneous ignition.

19611 **(PB—83-115840) Development of lightweight hydraulic supports. Open file report Sep 78-May 82.** Alexander, P.T. (ESD Corp., Santa Clara, CA (USA)). May 1982. 94p. NTIS, PC A05/MF A01.

After evaluating preceding studies and designs of lightweight supports, the all-hydraulic and the hydromechanical concepts were selected for detailed design and fabrication. Further analysis and testing showed that the all-hydraulic design was economically justified and met all the crucial engineering, manufacturing, and design criteria identified during the evaluation. Following Bureau of Mines approval of the detailed design, four all-hydraulic support models were fabricated. When functional and structural testing was completed, 40 additional units were constructed and distributed for in-mine testing. The units were acceptable by all three demonstration mines. The widespread interest in supports for seam heights greater than 8 feet led to expansion of the design data package. Four basic models were designed to cover the new height range, but no hardware has yet been fabricated.

19612 **(PB—83-117887) Longwall mining principles for safely working steep coal seams. Open file report 3 Dec 79-30 Jun 81.** Adam, R.F.J.; Douglas, W.J.; Reese, B.J. (Ketron, Inc., Wayne, PA (USA)). 30 Jun 1981. 162p. NTIS, PC A08/MF A01.

This report summarizes the principles of safely working steep coal seams using longwall mining methods. The report presents the state of the art and identifies the problems that result from seam inclination. Details are given on foreign longwall faces achieving good records of safety and productivity when mining on 30 degrees to 50 degrees inclined seams. Recommendations for further research are suggested.

19613 **(SAND—82-2949) Subsidence prediction for high-extraction mining using complementary influence functions.** Sutherland, H.J.; Munson, D.E. (Sandia National Labs., Albuquerque, NM (USA)). Feb 1983. Contract AC04-76DP00789. 35p. NTIS, PC A03/MF A01. Order Number DE83007579.

Surface subsidence caused by high-extraction underground mining is described through complementary influence functions. The concept of complementary functions was introduced recently by Sutherland and Munson. This concept differs from other proposed concepts in that the surface displacement is the result of the combined contributions of mined and unmined zones. This approach eliminates computational difficulties experienced with the conventional influence functions to complex room-and-pillar configurations. The analysis framework is reported here in two forms. The first is for the complete complementary influence function formulation and the second is the degenerate case of the complementary influence functions applied to a longwall geometry. The former is solved analytically; the latter graphically. Both are illustrated with analyses of actual case histories. 13 figures, 3 tables.

19614 **Ten ways to reduce longwall dust.** Niewiadomski, G.E.; Jankowski, R.A.; Kissell, F.N. (US Bur of Mines, USA). *Mining Congress Journal;* 68: No. 8, 46-49, 76(Aug 1982).

The article gives ways to reduce dust. In addition the Bureau of Mines has undertaken a major joint effort with industry to identify and document technology that may eliminate the longwall dust problem.

0130 Transport And Handling

REFER ALSO TO CITATION(S) 19486, 19487, 19492, 19497, 19553, 19594, 19600, 19610, 19644, 19954, 21881

19615 **(DOE/ET/13350—T5) Characterization and evaluation of washability of Alaskan coal: selected seams from Northern Alaska, Chicago Creek, Unalakleet, Nenana, Matanuska, Beluga, Yentna, and Herendeen Bay coal fields. Final technical report for phase IV, August 1, 1980-January 31, 1982.** Rao, P.D.; Wolff, E.N. (Alaska Univ., Fairbanks (USA). Mineral Industry Research Lab.). Nov 1982. Contract FG22-78ET13350. 66p. NTIS, PC A04/MF A01. Order Number DE83007890.

Washability characteristics were determined for fifteen coal samples from the Northern Alaska, Chicago Creek, Unalakleet, Nenana, Matanuska, Beluga, Yentna and Herendeen Bay coal fields. The raw coal was crushed to 1 1/2 inches, 3/8 inch and 14 mesh top sizes, and float-sink separations were made at 1.30, 1.40 and 1.60 specific gravities. The results are given as follows: original percent ash, final percent ash and percent yields given. The coals were mostly subbituminous and bituminous. (LTN)

19616 **(DOE/ET/13350—T6) Characterization and evaluation of washability of Alaskan coals: selected seams from the Northern Alaska, Nulato, Eagle, Nenana, Broad Pass, Kenai, Beluga, and Chignik coal fields. Final technical report for phase III, March 1979-January 31, 1982.** Rao, P.D.; Wolff, E.N. (Alaska Univ., Fairbanks (USA). Mineral Industry Research Lab.). Nov 1982. Contract FG22-78ET13350. 69p. NTIS, PC A04/MF A01. Order Number DE83007891.

Washability characteristics were determined for fifteen coal samples from the Northern Alaska, Nulato, Eagle, Nenana, Broad Pass, Kenai, Beluga and Chignik coal fields. The raw coals were crushed to 1 1/2 inches, 3/8 inch and 14 mesh topsizes, and float-sink separations were made at 1.30, 1.40 and 1.60 specific gravities. The results are given as follows: original percent ash, final percent ash and percent yield; in some cases the original and final percent sulfur content are given. The coals were mostly subbituminous and bituminous. (LTN)

19617 **(DOE/NBM—3008223) Gas-solid transport flow regimes: design and measurement.** Klinzing, G.E.; Mathur, M.P. (Department of Energy, Pittsburgh, PA (USA). Pittsburgh Energy Technology Center). 1980. 14p. NTIS, PC A02/MF A01. Order Number DE83008223.

The transport in gas-solid systems from the dilute to the extrusion flow regimes is reviewed. The troublesme dense phase regime is considered and design recommendations are given for each flow case. The homogeneous dense phase flow regime with loading from 10 to 50 is analyzed and a pressure drop relationship is presented. The mass flow measurements of the gas-solid system are studied using three meters that do not distort the flow stream because they are not inserted into it. Varying degrees of reliability are seen for these flowmeters.

19618 **(DOE/NBM—3008225) Recent developments in coal preparation in the USA.** Killmeyer, R.P.; Miller, K.J.; Deurbrouck, A.W. (Department of Energy, Pittsburgh, PA (USA). Pittsburgh Mining Technology Center). 1981. 14p. NTIS, PC A02/MF A01. Order Number DE83008225.

As the value of coal and, therefore, the importance of coal preparation, have grown in the US in the last few years, so have the sophistication and efficiency of preparation plant circuitry. Until a few years ago, most preparation plant flowsheets were relatively simple, with jigs or heavy-media for the coarse and intermediate size coal, and flotation for the fine coal. The coal flotation circuits were usually single-stage using open-trough or flow-through flotation cells, and reagent (usually frother only) was added directly into the feedbox of each flotation cell bank. In many plants, particularly where lower-rank coals or steam coals were washed, the fines were discarded to refuse or were recovered without cleaning. But in recent years, a number of preparation plants have been built with more flexible and complex circuitry utilizing various parallel circuits, multi-stage cleaning, split-feed flotation, and the capability of cleaning to finer sizes by specific gravity separation methods. To illustrate the changing trends in US coal preparation practice, this paper will review several new preparation plant flowsheets and fine coal circuits, as well as new processes and preparation plant design concepts.

19619 (DOE/NBM—3008423) **Oxydesulfurization of coal and sulfur-containing compounds.** Warzinski, R.P.; LaCount, R.B.; Friedman, S. (Department of Energy, Pittsburgh, PA (USA). Pittsburgh Energy Technology Center). 1980. 28p. NTIS, PC A03/MF A01. Order Number DE83008423.

The susceptibility of sulfur in coal to oxidative removal varies with the nature of sulfur-containing species. The inorganic compounds, primarily pyrite, marcasite, and iron sulfate, are amenable to removal by a variety of methods; the organically bound sulfur, however, is more diffucult to remove and exhibits varying degrees of resistance depending on its chemical environment. The extent and efficiency of organic sulfur removal from coal by air/water oxydesulfurization has been investigated and appears to depend on the type of coal and severity of treatment used. In general, higher rank coals exhibit more resistance to treatment than lower rank coals; however, the accompanying loss in heating value is greater for the latter. Similar treatment of sulfur-containing model compounds further illustrates the relative susceptibilities of different chemical species to oxidation. Extrapolation of these data to the treatment of coal is a first step in the elucidation of the complex chemistry involved. Combinations of chemical desulfurization, physical cleaning, and flue gas desulfurization are considered briefly. It is concluded that the greatest demand for chemically cleaned coal may be from industrial boilers since the cost of flue gas desulfurization rises sharply as the size of the installation decreases. (LTN)

19620 (DOE/PC/42295—T6) **Gravimelt process development. Quarterly technical progress report.** (TRW Energy Development Group, Redondo Beach, CA (USA)). 20 Feb 1983. Contract AC22-81PC42295. 10p. NTIS, PC A02/MF A01. Order Number DE83006962.

During the current reporting period, the Mod 2, bench-scale Gravimelt reactor was installed, shaken down and operated using a sample of 40% ash run of mine Pittsburgh No. 8 seam coal which had been mine cleaned to a level of 10.3% ash. Operation was successful and an excellent overall mass balance was achieved. Preliminary ash analyses from the test site show the above 97% ash removal calculated from run of mine was obtained as expected from previous laboratory scale tests. Large processed coal samples, prepared during the week of round-the-clock operation, were obtained for the planned washing studies and other protect requirements. 3 tables.

19621 (ICTIS/M—0152) **Beneficiation of Stockton coal by dense-media processes using organic parting liquids. Preliminary tests of prototype.** (Coal Research Association of New Zealand, Wellington). Sep 1982. 12p. Coal Research Association of New Zealand, Wellington.

Preliminary tests are described in the use of organic parting liquids in dense-media separation, for possible application to the beneficiation of Stockton coal (for use in anode-carbon manufacture). A small prototype separating chamber was fabricated. Tests carried out indicate that, with a feed of + 100 mesh coal containing about 0.9% ash, and with a parting-liquid specific gravity of 1.32, a 92.5% yield of 'floats' containing 0.25% ash could be obtained. Some ideas for commercial operation are presented.

19622 (PB—82-239732) **Review of the commodity flow studies (1975-1979).** Pike, J.; Gandham, B. (Newcastle upon Tyne Univ. (UK). Transport Operations Research Group). Sep 1981. 57p. (RR—36). NTIS, PC A04/MF A01.

The purpose of the study was to: Establish a data-base relating to the flows of a limited number of important commodities in terms of their origins, destinations, modes, packaging and handling characteristics; consider changes affecting the provision of transport within the commodities; and consider changes affecting the generation of flows and demand for the chosen commodities. The following nine commodities were selected for study: Iron Ore, Coal, General Steels, Petroleum Products, Bricks, Milk, Beer, Paper and Sugar. It was decided to concentrate upon the primary flows within these commodities i.e. flows from the point of production to redistribution depots, ports or manufacturing plants, rather than their detailed distribution to consumers.

19623 (PB—82-256595) **Distributing the risks of interbasin water transfers under drought conditions: the dilemma posed by coal slurry pipelines.** (Teknekron, Inc., Berkeley, CA (USA)). Mar 1982. 215p. NTIS, PC A10/MF A01.

Problems are examined concerning the use of western water to transport coal in slurry pipelines from mines to generating facilities during western water shortages. Potential water shortage risks to the parties-at-interest were identified and reviewed. It was found that, while each of three pipelines considered originates in an arid western state (Wyoming, Colorado, Utah), the water availability level, water use for irrigation, and the likelihood of local water shortages in the surrounding community varies considerably in each locale. The risks associated with western water use for pipelines fall heaviest on agricultural users who might need such water during water shortage periods.

19624 (PB—83-135509) **Pacific Bulk commodity Transportation System, phase III. Volume IV: marad/Boeing study. Final report.** (Boeing Engineering and Construction, Tukwila, WA (USA)). Sep 1981. 170p. NTIS, PC A08/MF A01.

Projections are developed for comparative costs in Japan in 1987 from imported oil and Utah coal transported to Japan by means of the Pacific Bulk Commodity Transportation System. Cost projections are derived from underground mining models and transportation systems for oil and coal utilizing inflation factors derived from economic projections to 1987. Japanese goals for steam coal imports from United States between 1985 and 1990 are described. Overland transportation costs and limited U.S. west coast port capacity are identified as obstacles to U.S.A. reaching this share. Methods of increasing pipeline throughput during startup are described and strategies for replenishment of storage basins at the U.S. terminal and at the overseas coal center are defined. Economics of a Japanese distribution system is analyzed based on the concept of a coal center serving four power plants; two by pipeline and two 150 miles distant served by pusher barge fleet. Comparisons are provided of relative costs of distributing coal in all slurry, solid coal, and a mixed mode systems. Trends in underground coal mine productivity in Utah are analyzed. Possible delays in design and construction of the Pacific Bulk Commodity Transportation System are reviewed.

19625 **Economic tradeoffs between flue gas desulfurization and coal cleaning.** Thomas, T. (Battelle, Columbus Lab, OH, USA). *Coal Technology;* 139-154(1981). (CONF-8111140—).

From 4. international coal utilization conference; Houston, TX, USA (17 Nov 1981).

Physical coal cleaning has been evaluated frequently for its use in supplementary SO_2 control. The existing studies examine differing issues and show differing conclusions. This paper addresses all of the known potential benefits to be had from coal cleaning. In the example quantification, there are two major benefits to be had FGD savings and systems availability. Together these two benefits alone may justify the use of coal cleaning, depending upon site specific data. 5 refs.

19626 (ANL/FE—80-10-Add.) **Sulfur control in fluidized-bed combustors: methodology for predicting the performance of limestone and dolomite sorbents. Addendum. Compilation of sorbent performance data from atmospheric fluidized-bed combustors.** Fee, D.C.; Myles, K.M.; Wilson, W.I.; Fan, L.S.; Smith, G.W.; Wong, S.H.; Shearer, J.A.; Lenc, J.F.; Johnson, I. (Argonne National Lab., IL (USA)). Sep 1982. Contract W-31-109-ENG-38. 99p. NTIS, PC A05/MF A01. Order Number DE83007659.

This addendum contains tabulated experimental data on sorbent utilization in fluidized-bed combustors. The data were extracted from a review of literature, dealing mainly with combustors greater than 18-in. in diameter. The tables include data on experimental variables, sorbent properties, coal properties, and the physical arrangement of the combustor. The format is designed to minimize the amount of data which must be entered for each experiment by making extensive use of libraries of the information, each common to many individual experiments. (LCL)

19627 (BNL—51596) **Coal-oil mixtures: an alternative fuel for the commercial sector. Annual report, fiscal year 1981.** Butcher, T.; Krishna, C.R.; Saunders, J. (Brookhaven National Lab., Upton, NY (USA)). Aug 1982. Contract AC02-76CH00016. 77p. NTIS, PC A05/MF A01. Order Number DE83008472.

Results are presented from a program aimed at identifying the hardware systems required for the implementation of coal-oil mixtures (COM) as a substitute boiler fuel in the commercial sector. Components for a COM burner system were evaluated both in a cold burner system test stand and a small cast iron boiler fitted with a modified retention head burner. Control valves, pumps, atomizers, and strainers were selected and combustion trials were conducted. Results are presented on thermal efficiency and particulate emissions. Agitation of a commercial sector fuel storage tank with a slurry recirculation system has been evaluated through model tank tests. The most successful arrangement tested was a set of six nozzles aimed across the tank floor. A fully settled slurry in the model tank has been resuspended in three hours and maintained at 98% suspension. Tests were also conducted in a 3800 liter (1000 gallon) vertical tank with a propeller agitator where it was shown that the slurry can be easily resuspended. In routine operation an agitator fractional on-time of about 10% may be adequate. An evaluation of the economics of conversion to COM in the commercial sector is presented. Conversion is currently attractive if a cyclone dust collector can be used for pollution control.

19628 (CONF-800878—, pp 233-247) **Fluidized bed combustion: an overview of design and operations.** Patterson, R.M. (Davy McKee Corp., Cleveland, OH). 1980. Univ. of Pittsburgh, Dept. of Chemical and Petroleum Engineering, Pittsburgh, PA 15261.

From 7. annual international conference on coal gasification, liquefaction, and conversion to electricity; Pittsburgh, PA, USA (5 Aug 1980).

Fluidized bed combustion (FBC) is an environmentally sound and energy efficient approach to burning a wide variety of fuels. With decreasing and unsure supplies of liquid and gaseous fuels, FBC has lately received attention as a commercial solid fuel combustion technology. This paper presents an overview of state-of-the-art of fluidized bed combustion technology. The FBC process is described in the first section. Following this, commercial suppliers (or potential suppliers) of FBC systems are listed, and the design parameters of available product lines are briefly reviewed. Data from operating units is then presented; and, finally, the economics of FBC versus competing technologies is reviewed. The theoretical advantages of fluidized-bed combustion are: utilization of high sulfur fuels without flue gas treatment, reduced combustion temperature, reduced NO/sub x/ emissions, reduced excess air requirements, reduction of combustor size, increased heat transfer to the working fluid, fuel versatility, compact modular unit, package construction of units, and easy-to-handle by-product material. Generally, these advantages are a result of (1) intense turbulence within the fluidized bed and (2) long particle residence time in the bed without a correspondingly long linear flow path requirement. A wide range of fuels may be used: gases, fuel oils, coal of all ranks, coal mine wastes, organic wastes, to name several. In theory, the fluidized-bed combustor will operate on any fuel which has a net calorific value greater than its sensible heat at the bed temperature. Perhaps the outstanding advantage of FBC is the ability to burn high sulfur coals in an environmentally acceptable manner without the need for auxiliary SO_2 control equipment.

19629 (CONF-800878—, pp 248-265) **Preliminary results from the DOE coal-oil mixture demonstration at Salem Harbor.** Dunn, R.M. (New England Power Service Co., Westborough, MA). 1980. Univ. of Pittsburgh, Dept. of Chemical and Petroleum Engineering, Pittsburgh, PA 15261.

From 7. annual international conference on coal gasification, liquefaction, and conversion to electricity; Pittsburgh, PA, USA (5 Aug 1980).

An 80 MW coal fired boiler which had been converted to burn No. 6 oil in 1969 was equipped with new burners and accessories to burn coal-oil mixture. A description of the 30% coal and 70% oil mixture preparation facility is given. Results of initial coal-oil mixture (COM) blending, combustion and stack emission tests are presented along with a discussion of initial startup problems encountered. EPRI will support an expanded boiler performance test program designed to yield information which may be utilized in the conversion of oil fired designed to COM. Recommendations are made for additional COM research and product development to improve reliability.

19630 (CONF-800878—, pp 266-277) **Operating Florida Power and Light Company's Sanford Plant on coal-oil mixture.** Cook, M.C. (Florida Power and Light Co., Miami). 1980. Univ. of Pittsburgh, Dept. of Chemical and Petroleum Engineering, Pittsburgh, PA 15261.

From 7. annual international conference on coal gasification, liquefaction, and conversion to electricity; Pittsburgh, PA, USA (5 Aug 1980).

On April 20, 1980, Florida Power and Light began burning a coal-oil mixture (COM) at its Sanford Power Plant. We believe that mix, which contained 10% by weight coal, was the first COM ever burned in a utility power plant which had originally been designed to be fired with oil. Since April, FPL has continued its Sanford COM experiment, gradually increasing the proportion of coal in the mix. As of August 1, 1980, FPL had successfully burned a COM fuel containing as much as 40% coal. In the weeks ahead, the concentration will gradually be increased to 50%, and we hope to conduct sustained combustion tests at that level. Initial results are encouraging.

19631 (CONF-8104107—10) **Fluidized-bed boiler: an industrial application at Central Soya Company, Inc., Marion, Ohio.** Vince, A.N.; Barnhart, R.D. (Central Soya Co., Inc., Fort Wayne, IN (USA)). 1981. 17p. Central Soya Company, Inc., Fort Wayne, IN 46802.

From 20. annual Kentucky industrial coal conference; Lexington, KY, USA (29 Apr 1981).

The Marion installation has demonstrated that a fluidized-bed has good application to medium-sized industries. Operational problems experienced are to be expected in any new design, and solutions can probably be found. Four significant advantages over a conventional coal-fired unit seem to be the lower capital cost of the packaged design, an increased boiler efficiency, low NO/sub x/ emissions, and a low SO_2 emission factor. Central Soya is currently investigating fluidized-bed units for replacement of large, gas/oil-fired boilers at another location.

19632 **(DOE/NBM—3008206) Industrial firing of coal-oil mixtures.** Bergman, P.D.; George, T.J.; Joubert, J.I.; Bienstock, D. (Department of Energy, Pittsburgh, PA (USA). Pittsburgh Energy Research Center). [nd]. 25p. NTIS, PC A02/MF A01. Order Number DE83008206.

COM utilization can displace as much as 40 to 45% of the oil consumed in an industrial facility, and at the same time permit the user to keep much of his oil-burning steam generation and process equipment intact with a modest degree of retrofitting. Those industries which have the necessary capital, technical experience, and lead-time to burn coal directly should proceed to do so. For those users less versed in the art who wish to gradually introduce coal into their plant fuel economy, COM firing should be explored as an alternative. A preliminary economic evaluation of the costs of retrofitting industrial boilers presently consuming No. 6 residual oil to COM-firing proved favorable. For existing boiler facilities of capacity 100,000 to 500,000 lb steam/hr, and assuming total capital charges of 25%, conversion costs of $2.14 to $2.49/10^6 Btu were estimated, depending uon whether the slurry fuel was prepared on-site or off-site. Coal was priced at $27 per ton and 1% S residual oil was purchased for $2.17/10^6 Btu. When the COM was manufactured in a large plant (30 million barrels per year) rather than a small plant (1 million barrels per year), the cost of COM declined from $2.10 to $1.84/10^6 Btu fired. The idea of introducing a different fuel concept into established markets poses very complex technical and economic problems. However, further studies of this nature should prove valuable in defining potential future markets for COM combustion.

19633 **(DOE/NBM—3008222) Settling characteristics of coal-oil mixtures and some model systems.** Klinzing, G.E.; Ekmann, J.M. (Department of Energy, Pittsburgh, PA (USA). Pittsburgh Energy Technology Center). [nd]. 26p. NTIS, PC A03/MF A01. Order Number DE83008222.

The use of coal-oil mixtures as a combustion fuel has a great potential for meeting a large fraction of our energy demand. The stability of these mixtures, that is, maintaining a homogeneous solid-liquid suspension, is vital. The settling properties of these mixtures has been studied by use of a system of ultrasonic sensors. In addition, model coal and oils have been employed to study the pure physics of the settling phenomena. The sedimentation theory of Smiles which relies on unsteady state diffusion analogies has been successful in modeling both the coal oil mixtures and the model systems. Pseudo diffusion coefficients have been determined and their dependence on various parameters have been found.

19634 **(DOE/NBM—3008448) Combustion of coal-oil mixtures in a 700-HP watertube boiler.** Pan, Y.S.; Bellas, G.T.; Mathur, M.P.; Bienstock, D. (Department of Energy, Pittsburgh, PA (USA). Pittsburgh Energy Technology Center). [nd]. 39p. NTIS, PC A03/MF A01. Order Number DE83008448.

Coal-oil mixtures containing up to 50 percent coal by weight have been successfully burned in a 700 HP watertube boiler, designed for oil firing, with no derating occurring. Carbon-conversion efficiencies were above 98 percent, and boiler efficiencies were the same as when firing No. 6 fuel oil. Combustion tests were conducted with No. 6 fuel oil mixed with Pittsburgh Seam coal pulverized to a coal particle size of 90 percent minus 200 mesh. Test results related to boiler performance, pollutant emissions, and ash deposition are presented. The equipment, instrumentation, and data acquisition system of the combustion test facility are described. The modest changes required to adapt the facility designed for oil firing to utilize coal-oil mixtures are discussed. Additional combustion tests needed to assess bottom-ash accumulation and the corrosion, erosion, and fouling behavior inherent in the long-duration operability of coal-oil mixtures in an oil-fired boiler are underway.

19635 **(DOE/PC/40267—3) Combustion characterization of coals for industrial applications. Third quarterly progress report, 1 October 1982-31 December 1982.** ya Nsakala, N.; Patel, R.L.; Lao, T.C. (Combustion Engineering, Inc., Windsor, CT (USA)). Feb 1983. Contract AC22-81PC40267. 13p. NTIS, PC A02/MF A01. Order Number DE83007515.

Primary stage stoichiometries of 15, 30, 50, 60, 70, 90 and an unstaged baseline test were employed. The effect of the primary stage stoichiometry on NO/sub x/ formation is presented in Figure 3. Results indicate the maximum NO/sub x/ reduction is at a primary stage stoichiometry of about 50%. Single stage baseline emissions were 498 ppM compared to the optimum NO/sub x/ emissions of 282 ppM from a premixed first stage stoichiometry of 50%. In other words, 43% NO/sub x/ emission reduction was obtained in the CMHF at 20% overall excess air level. The optimum primary stage stoichiometry for NO/sub x/ emissions can be explained as follows: During the combustion process, some fuel nitrogen forms volatile nitrogen species and some remains in the char. In an oxygen deficient primary stage, some volatile nitrogen will remain in as intermediate species such as HCN, CN, and NH/sub x/, some will react with oxygen to form nitrogen oxide (NO). The intermediate species can either be oxidized to NO/sub x/ in the secondary stage or react with NO to form harmless molecular nitrogen (N_2). If the primary stage is too air rich, these intermediate species will react with oxygen to form NO/sub x/. If, on the other hand, the primary stage is too fuel rich, most of these intermediate nitrogen species will remain unreacted since there is not enough oxygen or NO to react with. They, however, will be oxidized to NO/sub x/ in the secondary stage where oxygen becomes available. Therefore, an optimum primary stage stoichiometry exists, which provides an optimum amount of NO and intermediate nitrogen species favoring NO to N_2 conversion in the primary stage. The effect of excess air on NO/sub x/ emissions at the outlet of the furnace is shown in Figure 4. Results indicate that NO/sub x/ increases slowly with increasing excess air.

19636 **(DOE/PC/40280—T7) Parametric performance studies on fluizied-bed heat exchangers. Task 2. Experimental evaluation of multi-stage beds. Technical progress report, August 1, 1982-Decmber 31, 1982.** Stoeffler, R.C. (United Technologies Research Center, East Hartford, CT (USA)). Feb 1983. Contract AC22-81PC40280. 31p. (R—83-915729-24). NTIS, PC A03/MF A01. Order Number DE83007080.

Analyses and experiments have been made to investigate the heat transfer characteristics of single and multi-stage shallow fluidized bed heat exchangers for application to the recovery of heat from sources such as waste heat, and coal combustion or gasification. The work, conducted under Contract DE-AC22-81-PC40280 is an extension of that done previously under Contracts EC-77-C-03-1433 and DE-AC03-79-ET11348 and consists of two tasks; in Task 1, tests were conducted to investigate the effects of liquid condensate fouling on fluidized bed heat exchanger performance. The results obtained in these experiments have been reported in Reference 1. In Task 2, tests have been conducted to investigate the performance of fluidized beds which are staged using a baffle plate. In these tests, heat transfer performance in the baffle supported fluidized bed was equivalent to the enhanced performance achieved in beds supported by distributor plates. Since the open area of the baffle plate is large compared to that of the distributor plate, the pressure loss of the baffled two-stage heat exchanger was significantly less than the pressure loss for a two-stage heat exchanger having two distributor plates. The test results indicated that the amount of recirculation of bed material between the two beds was small, and the heat transfer effectiveness of staging with baffles would approach that of staging with distributor plates.

19637 **(DOE/PC/50261—T1) Investigate the effectiveness of calcium-treated coals in the capture of sulfur gases generated in staged fired combustors. First quarterly technical progress report, October 1, 1982-January 1, 1983.** Porter, J.H.; Manning, M.P.; Benedeck, K. (Energy and Environmental Engineering, Inc., Cambridge, MA (USA)). 1 Feb 1983. Contract AC22-82PC50261. 40p. NTIS, PC A03/MF A01. Order Number DE83006839.

During the first quarter's effort to Investigate the Effectiveness of Calcium Treated Coals in the Capture of Sulfur Gases Generated in Stage Fired Combustors, the following work has been done: (a) Task 1, the Literature Survey has been completed; (b) Task 2, Design and Construction of the Combustion Test Facility, has progressed significantly; and (c) Task 3, the Development of Calcium-Fixation Procedures, has been initiated. From Task 1, it was found that few articles have been published concerning calcium-fixation methods and sulfur-retention studies on calcium fixed coals. With respect to Task 2, a low-flow coal feeder and a char/

gas collection probe have been designed. The furnace for the combustion studies (a vertical-tube laminar-flow furnace) has been ordered and modifications of the furnace have been designed. Basic laboratory preparations are underway to commence Task 3. 6 figures, 2 tables.

19638 (EUR—7633-d,e,f,i, pp 283-289) **Evaluation of the flammability of coals low in volatile matter.** Chauvin, R. 1982. (In French). Commission of the European Communities, Luxembourg.

In Round table meeting on chemical and physical valorisation of coal.

The ease with which coal particles ignite in pulverized coal furnaces determine ignition distance and the stability of the flame, the conditions producing ignition which largely affect the subsequent combustion sequence. Knowledge of this characteristic additionally provides valuable guidance in selecting the coals which can be used in a furnace of given characteristics. The flammability of four anthracites of diverse origin was determined directly using a rapid-heating radiation furnace. Significant differences in flammability among the four coals was found and, more importantly, there was no correlation with the content of volatile matter.

19639 (N—8229376) **Plane flame furnace combustion tests on JPL desulfurized coal.** Reuther, J.J.; Kim, H.T.; Lima, J.G.H. (Pennsylvania State Univ., University Park (USA); Jet Propulsion Lab., Pasadena, CA (USA)). May 1982. 73p. (NASA-CR—169199). NTIS, PC A04/MF A01.

The combustion characteristics of three raw bituminous (PSOC-282 and 276) and subbituminous (PSOC-230) coals, the raw coals partially desulfurized (ca -60%) by JPL chlorinolysis, and the chlorinated coals more completely desulfurized (ca -75%) by JPL hydrodesulfurization were determined. The extent to which the combustion characteristics of the untreated coals were altered upon JPL sulfur removal was examined. Combustion conditions typical of utility boilers were simulated in the plane flame furnace. Upon decreasing the parent coal voltaile matter generically by 80% and the sulfur by 75% via the JPL desulfurization process, ignition time was delayed 70 fold, burning velocity was retarded 1.5 fold, and burnout time was prolonged 1.4 fold. Total flame residence time increased 2.3 fold. The JPL desulfurization process appears to show significant promise for producing technologically combustible and clean burning (low SO3) fuels.

19640 (PB—82-206715) **Achieving the best from boiler, through understanding Indian coal.** Sarkari, T.R. (Ahmedabad Textile Industry's Research Association (India)). Aug 1979. 53p. NTIS, PC A04/MF A01.

This report gives a basic understanding of coal and its behavior to industrial users so that they can use coal properly. The basic structure and properties of coal are listed. Special emphasis is given to the problems posed by coal quality and the measures to solve these problems. Also discussed in the report is to what extent caking coal, fines, high ash coal, low fusion coal, and undesirable alkaline impurities in coal affect boiler output.

19641 (PB—82-232380) **Prospects for increasing the direct use of coal in industrial boilers. Final task report Nov 79-Nov 80.** Bergman, M.K.; Dykes, R.M. (Environmental Protection Agency, Research Triangle Park, NC (USA). Industrial Environmental Research Lab.). Jun 1982. 320p. NTIS, PC A14/MF A01.

The report gives a comprehensive evaluation of factors (environmental, technical, economic, and institutional) influencing solid coal use in industrial boilers. Trends in coal use, recent legislative warrants, and technical and logistic problems in coal use at industrial plants are reviewed. Demographic aspects of the existing industrial boiler population are examined, and regional patterns in fuel consumption, boiler deployment, and the location of major energy consuming industries are identified. Six technologies and five alternate groups of the technologies are compared to the year 2000 on the basis of resource requirements and emissions. Technologies considered are conventional combustion in both a spreader-stoker boiler and with flue-gas desulfurization, fluidized-bed combustion, low-Btu gasification, and physical coal cleaning (alone and combined with the above technologies). Air emissions are further assessed from the perspective of existing air quality problems in industrial areas. Capital and annual costs for each technology are also compared. Sensitivity analysis is included to detail the extent to which varying operating parameters affect steam cost. Fuel choices are evaluated on industry- and region-specific bases. Finally, results of analyses are interpreted from the perspective of achieving environmental and energy goals.

19642 (SAND—82-8035) **Application of complex equilibrium calculations to the study of mineral matter during coal combustion.** Carling, R.W.; Mar, R.W.; Nagelberg, A.S. (Sandia National Labs., Livermore, CA (USA)). Feb 1983. Contract AC04-76DP00789. 29p. NTIS, PC A03/MF A01. Order Number DE83007050.

Complex thermodynamic calculations are potentially useful for the study of the complex chemistry associated with mineral matter evolution during coal combustion. However, one must be cognizant of the caveats, limitations, and assumptions before relying on the computed results. In this report, the effects of three factors on the computed results were examined: accuracy of the thermochemical data, species considered in the calculations, and condensed phase solution formation. The qualitative behavior of species was found to be fairly insensitive to errors in the data and solution effects; however, the absolute concentration of species may vary significantly. It was seen that the selection of species for consideration may have a significant effect on the quantitative and qualitative behavior of the computed results. In assessing the state of the art of computational techniques, and future needs, it is concluded that the technology is available to make the sophisticated calculations that are required. However, additional insight is needed on the rates and mechanisms of mineral matter decomposition, and a more complete thermochemical data base is required to make equilibrium calculations. 10 figures, 1 table.

19643 **Report to the IEA AFBC technical meeting at Petten, Netherlands, May 1982: TNO's environmental program on fluidized bed combustion.** van Duin, P.J. Hague, Netherlands; Netherlands Organization for Applied Scientific Research TNO (1982). 15p. (P—82/13; CONF-8205153—1). TNO, P.O. Box 217, Delft, Netherlands.

From IEA/AFBC technical meeting; Petten, Netherlands (1 May 1982).

TNO carries out an environmental research program on fluidized bed combustion of coal. Tests are executed with a 4MW experimental atmospheric fluid bed boiler. To reduce the emission of sulfur dioxide, coal is mixed with limestone. The limestone turned out to be used partially, due to the formation of a calcium sulfate layer on the surface of the limestone particles. This conclusion was confirmed by X-ray mapping. Fly ash was investigated on harmful properties. When collected at low temperatures fly ash showed substantial genotoxicity.

19644 **Development of coal-water slurries as boiler fuel.** Henderson, C.B.; Scheffee, R.S.; McHale, E.T. (Atl Res Corp, Alexandria, VA, USA). *Coal Technology;* 251-265(1981). (CONF-8111140—).

From 4. international coal utilization conference; Houston, TX, USA (17 Nov 1981).

The development of slurries of coal and water as a boiler fuel replacing No. 6 fuel oil has been actively pursued at the Atlantic Research Corporation since 1976. Funding for this effort has been provided by the U.S. Department of Energy, the Electric Power Research Institute and by corporate funds. The name ARC-Coal has been selected for these slurries. Stable coal-water slurries with bond-dry coal loadings between 62% and 77% have been prepared, evaluated rheologically, and successfully burned in a one-million BTU/hr experimental furnace without the assistance of other fuels. The advantages, market, and economic factors of coal-water slurries are discussed. The properties of these slurries, including combustion results are reviewed. Also discussed is the pilot line used for processing barrel quantities of fuel and a pilot plant capable of processing 600 bbl/day, scheduled to go into operation in June, 1982. The goal of developing a slurry which can be pumped over considerable distances through a pipeline and also be burned as a fuel is suggested. 5 refs.

19645 **New AFBC coal-fired steam generation facility for the Idaho Chemical Processing Plant.** Cowart, F.C. (Exxon Nucl Idaho Co, Idaho Falls, USA). *Coal Technology;* 53-67(1981). (CONF-8111140—).

From 4. international coal utilization conference; Houston, TX, USA (17 Nov 1981).

A 135,000 lb/hr atmospheric fluidized bed combustion (AFBC) Coal-Fired Steam Generation Facility is to be built at the Idaho Chemical Processing Plant (ICPP) within the Idaho National Engineering Laboratory. The facility at ICPP will be the first AFBC unit in the United States to burn low sulfur (sub-bituminous) western Coal. The paper discusses engineering studies performed, environmental considerations, use of low sulfur coal, method of contracting, performance specifications, plant description, and the current project status. 3 refs.

19646 (CONF-800878—, pp 444-456) **Problems and rewards in building national self-sufficiency in energy.** Stegmann, J.A. (South African Coal, Oil, and Gas Corp., Ltd. (SASOL), Sasolburg). 1980. Univ. of Pittsburgh, Dept. of Chemical and Petroleum Engineering, Pittsburgh, PA 15261.

From 7. annual international conference on coal gasification, liquefaction, and conversion to electricity; Pittsburgh, PA, USA (5 Aug 1980).

There are a number of factors favouring synfuel production in South Africa: first of all, there are suitable coal fields in the immediate vicinity of our main industrial area. The basic infrastructure for the establishment of synfuel plants therefore already exists and the market is close by. Secondly, nature has given us relatively favourable geological conditions permitting highly mechanized extraction techniques so that coal can be delivered to the synfuel plants at Secunda at a cost - including return on capital - of less than $10.00 per ton, based on 1980 price levels. Thirdly, because the industry and its natural market are remote from the coast, it enjoys some transport protection against products refined from imported crude oil. But what is even more important than these inherent economic advantages enjoyed by us in South Africa, is that we realized a long time ago that in trying to close the gap between the cost of synfuels and international oil prices, one is confronted with a moving target which can more effectively be attacked sooner rather than later. The classic method of project evaluation uses discounted cash flow techniques which place a very high premium on cash flow during the early years of a project and very little on cash flow during later years. This technique can be quite inappropriate when evaluating the economics of highly capital intensive synfuel projects, particularly if the calculations are based on frozen cost and price levels.

19647 **(DOE/EIA—0008(81/4Q)) Energy information report to Congress: quarterly report. Fourth quarter, 1981.** (Department of Energy, Washington, DC (USA). Energy Information Administration). Mar 1982. 44p. NTIS, PC A03/MF A01. Order Number DE83008061.

This report was prepared in response to the mandate of Congress set forth in Public Law 93-319, Section 11 (c) (2), that requires for each calendar quarter a report that contains energy information including imports of crude oil, petroleum products, natural gas, and coal; reserves and production of crude oil, natural gas, and coal; refinery activities; and petroleum inventories.

19648 **(DOE/EIA—0008(82/1Q)) Energy information report to Congress: quarterly report. First quarter, 1982.** (Department of Energy, Washington, DC (USA). Energy Information Administration). Jun 1982. 45p. NTIS, PC A03/MF A01. Order Number DE83008060.

In response to the mandate of Congress set forth in Public Law 93-319, Section 11 (c) (2), that requires for each calendar quarter this report contains energy information including imports of crude oil, petroleum products, natural gas, and coal; reserves and production of crude oil, natural gas, and coal; refinery activities; and petroleum inventories.

19649 **(DOE/EIA—0035(82/10)) Monthly energy review.** (Department of Energy, Washington, DC (USA). Energy Information Administration). Oct 1982. 112p. NTIS, PC A06/MF A01. Order Number DE83008010.

An overview of statistical data is presented for production, consumption, imports and exports. (PSB)

19650 **(DOE/EIA—0121(82/1Q)) Quarterly Coal Report, January-March 1982.** (USDOE Energy Information Administration, Washington, DC. Office of Coal, Nuclear, Electric and Alternate Fuels). Aug 1982. 82p. NTIS, PC A05/MF A01. Order Number DE83008048.

This report, provides comprehensive information about coal production, exports, imports, receipts, consumption, and stocks in the United States. The United States produced 218.7 million short tons of coal during the first quarter of 1982. This production total surpasses by 2.2 percent the amount produced during the first quarter of 1981. The United States exported 25.6 million short tons of coal during the first quarter of 1982. This exceeds by 14.8 percent the amount, 22.3 million short tons, exported during the same quarter of the previous year. The price of coal exports averaged $57.93 per short ton during January-March of 1982, $50.21 during those three months of 1981. US coal receipts at all end-use sectors during the first quarter of 1982 totalled 177.2 million short tons, 6.1 percent less than in the first quarter of 1981. Coal consumption during the first quarter of 1982 dropped slightly (0.1 percent) from the first quarter of 1981: 187.0 million short tons compared to 187.3 million. Total US coal stocks rose 1.5 percent to 212.6 million short tons on March 31, 1982, primarily due to an increase of 9.3 million short tons (38.6 percent) in coal stocks held by US coal producers and distributors. Coal production in 1982 is projected to be 883.6 million short tons, up 7.7 percent from the 1981 level of 820.1 million short tons. Domestic coal consumption is projected to rise from its 1981 level of 732.2 million short tons by only 1.9 percent, to 745.9 million short tons in 1982. Given that the economic recovery is projected not to begin until late 1982, coking coal consumpton is not expected to increase significantly until the fourth quarter of 1982.

19651 **(DOE/EIA—0121(82/2Q)) Quarterly coal report, April-June 1982.** (USDOE Energy Information Administration, Washington, DC. Office of Coal, Nuclear, Electric and Alternate Fuels). Oct 1982. 81p. NTIS, PC A05/MF A01. Order Number DE83007995.

This report provides comprehensive information about coal production, exports, imports, receipts, consumption, and stocks in the United States. Evidence of the Nation's economic slump was reflected by coal statistics for the second quarter of 1982. Except for a continued high export volume, all quarterly indicators showed depressed coal market conditions. Second quarter data revealed: the largest decline in quarterly coal consumption in recent years; receipts exceeding demand requirements by wide margins; near-record stockpiling of coal by consumers and by producers and distributors; lower-than-normal coal consumption at electric utilities; sharply reduced coke production; continued high export levels; and moderate increases in coal prices. The United States produced 213.8 million short tons of coal during the second quarter of 1982, 2.3% less than in the first quarter. US coal exports totaled 31.6 million short tons during the second quarter of 1982. During the first half of the year they reached a record 57.2 million short tons, 33.6% above last year's level. Domestic coal receipts in all end-use sectors exceeded requirements, particularly at electric utilities, which are predominantly tied to long-term contracts with take-or-pay provisions. The average price of steam coal at electric utilities and other industrial plants rose to $35.31 per short ton (a 1.7% increase) and $41.78 per short ton (a 1.6% increase), respectively. The average price of metallurgical coal at coke plants rose 2.0% to $66.36 per short ton. Domestic coal consumption fell 23.1 million short tons during the second quarter of 1982. It was the largest quarterly decline in recent years. (DMC)

19652 **(DOE/EIA—0125(81/4Q)) Coal distribution, January-December 1981.** McNair, M.B. (USDOE Energy Information Administration, Washington, DC. Office of Coal, Nuclear, Electric and Alternate Fuels). Apr 1982. 164p. NTIS, PC A08/MF A01. Order Number DE83008067.

This report presents quarterly US coal distribution data for January-December 1981, aggregated at the US coal producing area, coal producing district, census region, and state levels covering the following subjects: production and purchases; distribution (domestic and foreign); methods of transportation; consumer sector destination; and coal stocks. Coal distribution data are presented for the January-December periods of 1978, 1979, 1980, and 1981 so that comparisons may be made. Data for 1980 and 1981 include both anthracite and bituminous coal distribution while data for 1978 and 1979 cover only bituminous coal distribution. Production and/or purchases of coal produced in the United States from January-December 1981 totaled 819.3 million tons. A total of 820.8 million tons, including 1.4 million tons taken from coal stocks, was shipped to consumers. The January-December 1981 coal production was curtailed by the United Mine Workers of America strike that began on March 27 and ended on June 7. A summary of the coal shipments to consumers in the United States showed that 580.3 million tons went to electric utility plants, 58.1 million tons went to coke plants, 62.8 million tons went to other industrial consumers, a total of 6.9 million tons was distributed for residential/commercial consumers, and 0.1 million tons went to the transportation sector (railroad fuel and vessel fuel). Of the total coal distributed from January-December 1981, 709.5 million tons went to consumers in the United States (including the District of Columbia) and a total of 11.3 million tons was exported - 15.2 million tons to Canada and 96.1 million tons to Mexico and destinations overseas. A summary of mode of transport revealed that 420.9 million tons were shipped by rail, 121.1 million tons were shipped by water, 103.7 million tons by truck, and 62.0 million tons by tramway/conveyor and slurry pipeline. (DMC)

19653 **(DOE/EIA—0125(82/1Q)) Coal distribution, January-March 1982.** McNair, M.B. (USDOE Energy Information Administration, Washington, DC. Office of Coal, Nuclear, Electric and Alternate Fuels). Jul 1982. 92p. NTIS, PC A05/MF A01. Order Number DE82012718.

This report presents quarterly US coal distribution data for January-March 1982, aggregated at the US coal producing area, coal producing district, census region, and state leels covering the following subjects: production and puchases; distribution (domestic and foreign); methods of transportation; consumer sector destination; and coal stocks. Coal distribution data for the January-March periods of 1978 to 1982 are presented so that comparisons may be made. Data for 1980 to 1982 include both anthracite and bituminous coal distribution while data for 1978 and 1979 cover only bituminous coal distribution. Production and/or purchases of coal produced in the United States from January-March 1982 totaled 218.7 million tons. Of this amount, 210.8 million tons were shiped to consumers and 8.0 million tons were added to coal stocks. Of the total coal distributed from January-March 1982, 180.9 million tons went to consumers in the United States (including the District of Columbia) and a total of 29.9 million tons was shipped for export - 3.5 million tons to Canada and 26.3 million tons to Mexico and destinations overseas. A summary of the coal shipments to consumersin the United States showed that 149.8 million tons went to electric utility plants, 12.6 million tons went to coke plants, 16.0 million tons went to other industrial consumers, a total of 2.1 million tons was distributed for residential/commercial consumers, and 0.002 million tons went to the transportation sector (railroad fuel and vessel fuel). The consumer category for 0.4 million tons was either unknown or concealed to avoid the disclosure of individual company data. A summary of the mode of transport showed that 107.2 million tons were shipped by rail, 28.9 million tons by water, 27.1 million tons by truck, and 17.1 million tons by tramway/conveyor or slurry pipeline. (DMC)

19654 **(DOE/EIA—0125(82/2Q)) Coal distribution, January-June 1982.** McNair, M.B. (USDOE Energy Information Administration, Washington, DC. Office of Coal, Nuclear, Electric and Alternate Fuels). Oct 1982. 93p. NTIS, PC A05/MF A01. Order Number DE83008003.

This publication provides data on coal distribution by coal-producing district, consumer use, and method of transport. Production and/or purchases of coal in the United States from January-June 1982 totaled 433.8 million short tons or 24% more than the 349.2 million tons produced or purchased during the same period of 1981. The January-June 1981 coal production was curtailed by the United Mine Workers of America strike that began on March 27 and ended on June 7. Distribution of coal during the first six months of 1982 totaled 421.7 million tons, an increase of 20% over the 352.5 million tons distributed during January-June 1981. A total of 12.0 million tons of coal was added to stocks held by producers and distributors during January-June 1982. In summary, there were no increases during January-June 1982 over the same period in 1980 when the amount of coal to domestic consumers was compared to the percent of all shipments. In contrast, there was a noticeable change when the coal shipments to foreign countries were compared to the percent of all shipments. The amount of coal exported during January-June 1982 was 14% of all shipments compared with 10% of all shipments in January-June 1980. (DMC)

19655 **(DOE/NBB—0026) Documentation of the reserve-related data inputs to the Resource Allocation and Mine Costing model.** (Synergic Resources Corp., Bala-Cynwyd, PA (USA); Oak Ridge National Lab., TN (USA)). Sep 1982. 54p. NTIS, PC A04/MF A01. Order Number DE83008072.

The methodology and data used to prepare reserve-related inputs to the Resource Allocation and Mine Costing (RAMC) program are documented. The report is intended for analysts familiar with the modeling of the coal market and, in particular, the economic-engineering approach to the development of coal supply curves. The reserve-related inputs developed during this study include: distribution of demonstrated reserves by supply region, coal type, and mining method; distribution of reserves dedicated to existing mines (committed reserves) by supply region, coal type, and mining method; allocation of remaining strippable reserves to overburden categories; allocation of remaining deep reserves to seam depth and type opening (drift and shaft/slope) categories; estimation of future recovery factors by supply region and mining method; and estimation of current f.o.b. mine prices by supply region and coal type. Emphasis was placed on using current EIA data files to calculate coal reserve quantities and qualities, coal prices, committed reserves, seam thickness, and production. Data on overburden depth for both strippable and deep reserves were obtained from the Mine Safety and Health Administration (MSHA) and various State agencies. Similar data are not currently collected or maintained by EIA.

19656 **(NP—3900498) Virginia metallurgical-coal production and exports: a prospects update.** Hibbard, W.R. Jr. (Virginia Polytechnic Inst. and State Univ., Blacksburg (USA)). 1 Nov 1982. 16p. NTIS, PC A02/MF A01. Order Number DE83900498.

The metallurgical coal (met coal) market is the most important single factor related to the economic well-being of Virginia's coal industry and its state-based railroads. And, for both industries, it has proved to be an unstable market influenced by the recessionary cycles which have effected US and foreign businesses. Currently, coal producers in southwestern Virginia acknowledge the market is depressed, causing worker layoffs and mine closings, yet the railroads have continued to carry record-breaking quantities of coal to Hampton Roads for export during the first six months of this year, and 1982 totals will be the largest in history. How can this incongruity be explained. This study attempts to identify and evaluate the various factors affecting the met coal market and provides an estimate delineating the Virginia market to the year 2000. It is projected to increase by up to 20 percent as low sulfur, low ash met coal is used as a replacement by electric utilities both here and abroad. This expansion could be further influenced by control regulations, resulting from the current reappraisal of the Clean Air Act, and a narrowed price differential between met and steam coal as an advanced steel-making technology reduces the requirement for coke.

19657 (PB—82-208562) Northern Great Plains coal mining: regional impacts. Agriculture information bulletin. Stinson, T.F.; Bender, L.D.; Voelker, S.W. (Economic Research Service, Washington, DC (USA). Economic Development Div.). Jun 1982. 41p. NTIS, PC A03/MF A01.

Rural communities in the Northern Great Plains (Montana, North Dakota, and Wyoming) must plan for the impacts of large-scale development of the coal deposits in the area. In the long run, communities gaining population because of the new developments, but unable to tax the new mine or powerplant, will probably experience financial problems. In the short run, most affected communities will probably experience front-end cash flow problems due to lags in collecting revenues from the new projects. The combined effects of several new mines and powerplants in a limited geographic area may exceed the capacity of the community to provide services at existing levels.

19658 (LBL—13600, pp 173-176) **Mine ventilation planning: a case study.** McPherson, M.J.; Hood, M. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1981.

One of the main objectives of this work program was to investigate the benefits of employing a systems approach to ventilation design in an existing US mine. Sunnyside Mine No. 3 in Utah has been operating continuously for more than 80 yr. It was selected for the study because its ventilation system was incapable of supplying adequate quantities of air to the working faces.

19659 (NP—3901496) Haulage accident prevention. (Bureau of Mines, Washington, DC (USA). Div. of Education and Training Services). Aug 1972. 230p. Bureau of Mines, Washington, DC.

A textbook for a course in mine haulage safety is presented. The purpose of the course is to instruct the trainee in: (1) awareness of the need for safety in the area of mine haulage; (2) attitudes needed for safety in everyday work situations; and (3) knowledge to improve overall safety in mine haulage. The courses for accidents are discussed and case histories are studied. A discussion on recognizing hazards and recommended safety practices to prevent accidents are presented. The course should take 12 hours to complete. (DMC)

19660 (PB—82-214784) Coal mine dust personal sampler (CMDPS). Final report. Kinneman, W.H. (Bendix Corp., Baltimore, MD (USA). Environmental and Process Instruments Div.). Jul 1973. 15p. NTIS, PC A02/MF A01.

The pump unit and electronic assembly are described for a personal sampler for coal mine dust. Operating characteristics are given, including flow rate, timer accuracy, flow rate stability, pulsation dampening, pressure drop, system leakage test, and intrinsic safety approval. Improvements are suggested for the Coal Mine Dust Personal Sampler design.

19661 (PB—82-214792) Mining hazard evaluation and technical assistance report no. HHF-80-109-110, Patriot Coal Company Laboratory, Kingwood, West Virginia. (National Inst. for Occupational Safety and Health, Cincinnati, OH (USA)). Jun 1980. 16p. (HHE—80-109-110). NTIS, PC A02/MF A01.

On March 5, 1980, at the request of the Mine Safety and Health Administration (MSHA) District 3 Manager, the National Institute for Occupational Safety and Health (NIOSH) conducted an industrial hygiene survey of the Patriot Coal Co.'s Coal Laboratory located in Kingwood, WV., to assess worker exposure to ambient air-borne concentrations of perchloroethylene (PCE)* vapors generated during routine float sink testing of coal. Results of air sampling conducted during the float-and-sink testing operation demonstrated that the personnel employed in this area were exposed to PCE in excess of the current NIOSH recommended ceiling level of 100 parts per million (ppM). The combination of incorrect work practices, inadequate ventilation and the projected workload increase at the laboratory could reasonably be expected to produce exposures in excess of the current MSHA standard (100 ppM-8 hr. Time Weighted Average).

19662 (PB—82-218660) Benefit-cost analysis of health and safety research and development projects in coal, metal and non-metal mining. Open file report Oct 79-Jun 81. Davis, R.P.; Brown, G.R.; Douglas, W.J. (Ketron, Inc., Wayne, PA (USA)). May 1981. 109p. NTIS, PC A06/MF A01.

This report describes the development of an analytical procedure for evaluating the potential economic effects on the mining industry of Bureau of Mines sponsored health and safety projects. A number of economic measures were utilized, most of which involve discounted cash flow analysis. Problems were encountered in attempting to collect data that was both consistent and accurate in validating the modeling procedure. As a consequence, the benefit-cost procedure applies parametric analysis in evaluating projects. By varying parameters that have a high degree of uncertainty over a range of expected values, a corresponding set of benefit-cost indices can be obtained. The Benefit-Cost Index represents the economic output per unit of investment in the proposed technology by the mining industry sector. The Benefit-Cost Analysis Model, version 1 (BCAM/1) is a computerized procedure that has been installed at the Bureau's Pittsburgh Research Center computer facility.

19663 (PB—82-230178) Evaluation of coal mine dust personal sampler performance. Final report. Doemeny, L.J.; Sorenson, S. (Minnesota Univ., Minneapolis (USA). School of Public Health). Nov 1973. 96p. NTIS, PC A05/MF A01.

The performance and accuracy of the coal mine dust personal sampler was evaluated. Mechanical properties of the sampler, such as battery life and pump flow meter accuracy, were kept constant. Penetration curves were obtained using monodisperse aerosols of several diameters for three sampling flow rates and three pulsation rates at each flow rate. The effects of particle charge, sampler orientation, air velocity, and mass loading were evaluated using polydisperse coal dust. Results were compared to the respirable mass dust criterion of the Los Alamos (LASL) Atomic Energy Commission, the British Medical council respirable (BMRC) coal dust criterion, and the American Conference of Governmental Industrial Hygienists (ACGIH) criterion.

19664 (PB—83-131037) Supplied-air respirator system for underground coal miners (instruction manual). (Synsis, Inc., Los Angeles, CA (USA)). 1982. 12p. NTIS, PC A02/MF A01.

A Supplied Air Respirator designed for use by underground mining equipment operators is described. Its assembly, installation, operation, and maintenance are discussed. It is mounted directly on, and derived its power from, the mining machine. A hydraulic motor is required. Compressed air was supplied at 60 to 80 pounds per square inch through a 0.5 inch diameter tube to a mask. Dust is removed down to the submicron range. The authors conclude that this system provides purified air to the coal miner with the least possible interruption of comfort and efficiency.

19665 (PB—83-137265) Measurement and control of respirable dust in mines. Final report. (National Materials Advisory Board (NRC), Washington, DC (USA)). 1980. 417p. NTIS, PC A18/MF A01.

This report examines the problems and hazards of airborne mine dust, particularly in coal-mining operations. A comprehensive overview of the current status of research, legislative regulations, and measurement and control technologies is also provided. Contents include: Chapter I. Executive Summary and Recommendations; Chapter II. Discussion and Conclusions with sections on Definition of Respirable Dust, Effects of Composition, Variations between Individuals, Personal Sampler Units, Other Sampler Units, Dust Production, Suppression and Collection and Noncoal Mines; Chapter III. Overview and Chapter IV. State of the Art in Control of Respirable Dust with sections on Ventilation, Fragmentation, Machine Design, Noncoal Mining, Dust Measurement and Deposition and Retention of Inhaled Particles.

19666 (PB—83-139295) **Industrial hygiene study of TVA workers in coal-fired power plants.** McFeters, J.J. (National Inst. for Occupational Safety and Health, Morgantown, WV (USA)). Jun 1981. 128p. NTIS, PC A07/MF A01.

A survey to measure baseline exposure to coal dust, asbestos (1332214), sulfur-dioxide (7446095) (SO_2), nitrogen-dioxide (10102440) (NO_2) fly-ash (68131748), nitric-oxide (10102439) (NO) sulfites (SO_3) sulfates (SO_4) and noise was conducted at the Tennessee Valley Authority (TVA) coal fired power facilities. Personal and area atmospheric samples were taken and historical exposure data examined.

19667 (PNL-SA—10869) **Identification and comparative genotoxicity of polycyclic aromatic hydrocarbons and related nitrogen-containing heteroatomic species in products from coal liquefaction processes.** Later, D.W.; Pelroy, R.A.; Mahlum, D.D.; Wright, C.W.; Lee, M.L.; Wilson, B.W. (Pacific Northwest Lab., Richland, WA (USA)). Feb 1983. Contract AC06-76RL01830. 18p. (CONF-8210100—2). NTIS, PC A02/MF A01. Order Number DE83006939.

From 7. international symposium on polynuclear aromatic hydrocarbons; Columbus, OH, USA (26 Oct 1982).

A series of process distillation cuts from a solvent refined coal process were separated into polycyclic aromatic hydrocarbons (PAH) and nitrogen-containing polycyclic aromatic hydrocarbons (N-PAC) chemical classes and the fractions tested for biological activity by both microbial mutagenicity and mammalian skin carcinogenicity assays. Qualitative and quantitative chemical characterization of individual PAH and N-PAC in these materials was also performed. The results of biological and chemical analyses are presented in this paper and used to assess the comparative mutagenicity of the PAH and N-PAC from complex mixtures of coal liquefaction materials. Chemical class separation was obtained using adsorption column chromatography. Gas chromatography and mass spectroscopy were used to identify the fractions. The following PAH compounds were identified and quantitiated: phenanthrene, fluoranthene, pyrene, benzoanthracene, chrysene, methylchrysens, benzo(j) or (b)fluoranthene, benzo (k) fluoranthene, 7,12-Dimethyl-benzanthracene, benzopyrene, and benzoperylene. N-PAC compounds identified were: carbazole, benzo(a)carbazole, phenanthridine, 1-azapyrene, 2-azafluoranthene, benz(c)acridine, 2-aminofluorene, 3-aminophenanthrene, 2-aminoanthracene, 2-aminopyrene, 8-aminofluoranthene, 3-aminochrysene, and 7-aminobenzo(a)pyrene. In terms of microbial mutagenicity using the Ames test, the N-PAC, in general, are more active than the PAH; the principal mutagenic N-PAC agents being the amino-PAH. If carcinogenicity is investigated by the mouse skin initiation/promotion approach, the PAH are the most potent carcinogens with activity increasing with increasing distillation temperature. (DMC)

REFER ALSO TO CITATION(S) 19591, 20812

19668 (CONF-800878—, pp 1-11) **United States Synthetic Fuels Corporation: a banker's perspective.** Mueller, C.M. (Bankers Trust Co., New York, NY). 1980. Univ. of Pittsburgh, Dept. of Chemical and Petroleum Engineering, Pittsburgh, PA 15261.

From 7. annual international conference on coal gasification, liquefaction, and conversion to electricity; Pittsburgh, PA, USA (5 Aug 1980).

To put it simply: The Synthetic Fuels Corporation is intended to shorten the lead time for the development of a viable synfuels industry. In setting up the corporation the government has recognized the need to offer initial aid by assuming unquantifiable risks. Under this umbrella, the private sector can then evaluate and eventually accept these risks, and with them the full ownership and control of the industry. This government action will result in the promotion and development of a new industry on an accelerated basis, at a time when its development is most critical. The Synfuels Corporation is nearly unique in the history of the US government support of industrial development. The Synfuels Corporation is equipped to face challenges that could not be coped with through the capabilities granted to any other agency. The critical issue is how successfully it meets those challenges. To a very large extent this will depend upon the corporation's inherent structural strengths and weaknesses and the skill with which the program is administered. It will also depend on its ability to attract investors and their financiers.

19669 (CONF-800878—, pp 12-38) **Synthetic fuels: a view of the Energy Security Act from the inside.** Grundy, R.D. (Senate Committee on Energy and Natural Resources, Washington, DC). 1980. Univ. of Pittsburgh, Dept. of Chemical and Petroleum Engineering, Pittsburgh, PA 15261.

From 7. annual international conference on coal gasification, liquefaction, and conversion to electricity; Pittsburgh, PA, USA (5 Aug 1980).

The purpose of Title I of the Energy Security Act is to utilize to the fullest extent the Constitutional powers of the Congress to reduce the threat of economic disruption from oil supply interruptions and increase the nation's security by fostering commercial synthetic fuel production the equivalent of at least 500,000 barrels of crude oil equivalent per day by 1987, increasing to 2 million barrels per day by 1992. Perhaps the most significant feature of the Energy Security Act is the Congress' judgment that such a major federal commitment to the development of a domestic synthetic fuels industry required creation of a special purpose federal entity - the United States Synthetic Fuels Corporation. An independent federal entity was authorized to provide financial assistance to encourage and assure the flow of capital funds to those sectors important to the domestic production of synthetic fuel. This action is comparable to establishment of the National Aeronautics and Space Administration (NASA) to carry out our national commitment to place a man on the moon. Before awarding financial assistance the Corporation must undertake a solicitation on a competitive basis. An initial set of solicitations must encompass a diversity of synthetic fuel technologies as well as all the available forms of financial assistance. The Congress intended that all solicitations be formulated to encourage innovative synthetic fuel proposals encompassing the broadest range of concepts. Thus the Congress intended that solicitations not unnecessarily contain sufficient detail so as to constrain bidders.

19670 (CONF-800878—, pp 287-303) **Guidelines for coping with the Powerplant and Industrial Fuel Use Act of 1978.** Vlcek, J.B. (Gardner, Carton and Douglas, Washington, DC). 1980. Univ. of Pittsburgh, Dept. of Chemical and Petroleum Engineering, Pittsburgh, PA 15261.

From 7. annual international conference on coal gasification, liquefaction, and conversion to electricity; Pittsburgh, PA, USA (5 Aug 1980).

Coverage: (a) The Powerplant and Industrial Fuel Use Act (FUA) applies to new and existing powerplants and new and existing Major Fuel-Burning Installations (MFBI's). (b) Powerplants and MFBI's are defined as boilers, internal combustion engines (MFBI's only), gas turbines, or combined cycle units. Use of petroleum or natural gas in new powerplants or new MFBI's is prohibited unless an exemption is granted. Use of natural gas is prohibited in existing powerplants after January 1, 1990 unless an exemption is granted. The Secretary of the Department of Energy (the Secretary) may, at any time, prohibit use of natural gas or petroleum in existing powerplants on a case-by-case or categorical basis unless such plant qualifies for an exemption. The Secretary may, at any time, prohibit use of petroleum or natural gas in an existing MFBI that is capable of using coal or an alternate fuel, unless such installation qualifies for an exemption. Final regulations issued in June 6, 1980 Federal Register generally cover all Parts except those pertaining to existing MFBI's and powerplants. Cites for those Parts are to interim regulations contained in July 23, 1979 Federal Register. In some cases, under certain conditions, temporary or permanent exemptions can be obtained. The conditions and methods of filing for such are discussed in the paper. They are very complex and need to be read in detail.

19671 (DOE/METC—82-51, pp 195-200) **Comments on the gasification of coal.** Reichl, E.H. Sep 1982. NTIS, PC A10/MF A01.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

The review talk was generally critical of the results of US research in coal gasification. In spite of the large expenditures in the US, the innovations reported as most significant with respect to commercialization were the Koppers-Totzek process, the Lurgi pressurized and slagging reactor development (both by Lurgi and BGG at West field) and the high pressure, fluidized bed pilot plant by Winkler (i.e. the significant developments occurred in Europe). This is contrasted with the American success in putting a man on the moon and developing the atom bomb: synthetic fuels are a different problem. There has been one result from the billions of dollars that was indeed a great contribution and one that would not have happened without DOE dollars: the education of an entire generation of scientists and engineers in the field of coal. Many professionals are now knowledgeable about gasification. Maybe several thousands of them would not have been involved in coal in any way short of this Government-sponsored program. This is a major asset for the nation, particularly for a nation with such huge resource of coal within its borders. Without this Government program, these people would not exist. Maybe the payoff will come about as a result of this educational process. Maybe curiosity has been sufficiently aroused and inventiveness stimulated so that just one of them will lead us to the promised land of an economic synthetic fuel process.

19672 **(DOE/EIA—0219(81)) International energy annual, 1981.** (USDOE Energy Information Administration, Washington, DC. Office of Energy Markets and End Use). Sep 1982. 106p. NTIS, PC A06/MF A01. Order Number DE83008066.

An overview of world primary energy is presented in Btus; in quantity production; and in petroleum supply, disposition and refinery capacity; natural gas supply and disposition; coal supply and disposition; world petroleum prices and energy reserves. Appendices cover energy sources; geographical regions; volume and weight conversions by energy source; and gross thermal conversions by energy source. (PSB)

0201 Reserves

19673 **(PB—82-230954) Estimation of resources and reserves. Final report.** Adelman, M.A.; Houghton, J.C.; Kaufman, G.; Zimmerman, M. (Massachusetts Inst. of Tech., Cambridge (USA). Energy Lab.). Mar 1982. 533p. NTIS, PC A23/MF A01.

This report analyzes the economics of resource and reserve estimation. Part One deals with the economic theory of natural resources and examines how markets deal with exhaustible resources. The succeeding parts examine each resource individually. Part Two and Three deal with oil and gas. Part Two treats the measurement of already discovered deposits. It examines the concept of proven reserves and the behavior of resources over time. Part Three turns to undiscovered deposits and asks how the size of undiscovered but suspected deposits are estimated. It casts a critical eye upon the biases inherent in many of the estimation methodologies. Part Four examines coal resource and reserve estimation. In the United States an attempt has been made to define an economically meaningful classification of coal reserves and resources. This classification is analyzed in detail along with the more general issue of coal supply. The focus is on already discovered deposits since knowledge of where coal lies is great and new discoveries play a small role in coal supply. Part Five treats uranium. For uranium, as for coal, extraction costs are high and reserve estimation must reckon with cost estimation. Part Six synthesizes Parts Two through Five by placing resource and reserve estimates in the context of a cumulative cost curve.

0202 Geology And Exploration

19674 **(DOE/EIA—0372/1) Outer Continental Shelf (OCS) Oil and Gas Supply Model. Model 1. Model summary and methodology description.** Farmer, R.D. (USDOE Energy Information Administration, Washington, DC. Office of Oil and Gas). Dec 1982. 87p. NTIS, PC A05/MF A01. Order Number DE83008788.

This document describes the methods utilized in the Energy Information Administration's Outer Continental Shelf Oil and Gas Supply Model (OCSM) to evaluate the impacts of alternative economic and policy situations on future oil and gas production from the Outer Continental Shelf (OCS) regions of the Lower-48 states. The volume is organized into three chapters. In the introductory chapter, the basic analytical capabilities of the model are listed, and both the economic rationale for the model design and the basic structure of the model are described. Also, OCSM is compared to several previous models developed to evaluate OCS petroleum resources. Chapter 2 describes in more detail how the model represents the economics of the oil and gas supply process. The principal stages of activity conducted by offshore petroleum firms, the economic choices faced by firms at each of these stages, and the model's representation of this decisionmaking are described. Chapter 2 concludes with a summary of the major strengths and limitations of the OCSM approach to forecasting OCS petroleum supply. Chapter 3 describes the structure of the model, the major functions performed in each of the model's components, and the general mathematical representation of these functions.

19675 **(DOE/EIA—0372/2) Outer Continental Shelf (OCS) Oil and Gas Supply Model. Volume 2. Data description.** Farmer, R.D.; Zaffarano, R.F. (USDOE Energy Information Administration, Washington, DC. Office of Oil and Gas). Dec 1982. 79p. NTIS, PC A05/MF A01. Order Number DE83008787.

This document describes the sources of data used by the Outer Continental Shelf Oil and Gas Supply Model (OCSM). The prime objective of this report is to document the sources of data on which the model is based. Thus, the report permits supply forecasts and the results of analyses that rely on the model to be properly evaluated and verified, and it also facilitates updating and revision of the basic data sources. In addition to providing basic documentation of OCSM, however, the report also provides resource, technology, and cost data that are of value in their own right for analysis of many issues concerning the exploitation of offshore petroleum resources. These data have numerous applications that do not depend on use of the total modeling system.

19676 **(NP—3900704) Prospects for oil and gas in the Coos Basin, western Coos, Douglas, and Lane Counties, Oregon. Oil and gas investigation 6.** Newton, V.C. Jr. (Oregon State Dept. of Geology and Mineral Industries, Portland (USA)). 1980. 114p. State of Oregon, Dept. of Geology & Mineral Industries, 1005 State Office Bldg., Portland, OR 97201.

The Coos Basin investigation was undertaken to evaluate the possibility of finding commercial amounts of oil and gas in the region. The study was extended to include the continental shelf because that area is believed to contain the best prospects in the State for hydrocarbon accumulations. Although mapping of geologic structures was the main thrust of field work, some basic mapping of sedimentary units was done in the northern part of the project area. Sandstones appearing to have reservoir qualities were sampled for porosity and permeability tests. Petrography of these sandstones was done to see if rock units could be identified by mineral characteristics. Samples of well cuttings and shale outcrops were tested for source rock characteristics to learn if maturation of organic material contained in geologic formations of the Coos Basin had reached a point where oil and gas could have been generated. Samples were taken from five deep wells for micropaleontological determinations to determine the stratigraphy and structure of the Coos Basin and the adjacent continental shelf. Seismic records of the southwestern coastal area were processed for the first time by

Couch's Geophysical Group to give a model of subsurface conditions offshore. These data were tied to gravity, magnetic, and deep well correlations both offshore and onshore.

19677 **(PB—82-227653) Studies related to the deep earth gas. Annual report Jan-Dec 81.** Gold, T.; Bilson, E.; Soter, S. (Cornell Univ., Ithaca, NY (USA). Center for Radiophysics and Space Research). Mar 1982. 65p. NTIS, PC A04/MF A01.

The purpose of this research is to elucidate the origin of terrestrial hydrocarbons, principally of methane and petroleum. This year the authors continued the experimental and theoretical work conceived for this purpose. They obtained the first significant experimental success in reacting methane with petroleum hydrocarbons. They established that such a reaction does occur at a measurable rate in the presence of natural clay catalysts at temperatures and pressures existing in the geological setting of petroleum formation. Thus they have shown that upward migrating methane may participate in petroleum formation. The authors have assembled a great deal of evidence concerning regional patterns of hydrocarbon deposits, trace element content, the geologic setting of the deposits and the chemical and physical processes in the upper mantle and the crust, toward the case that methane from deep sources has penetrated the crust in large quantities, and that this has contributed to the formation of much of the world's natural fuel supplies.

19678 **(PB—82-236266) Estimation of the future rates of oil and gas discoveries in the western Gulf of Mexico. Professional paper.** Drew, L.J.; Schuenemeyer, J.H.; Bawiec, W.J. (Geological Survey, Reston, VA (USA)). 1981. 32p. NTIS, PC A03/MF A01.

The purpose of this study was to devise a model to forecast the rate at which oil and gas fields will be discovered in the study area in the Gulf of Mexico. The study area is off Texas and Louisiana and covers 156,639 sq km in which water depths are as great as 200 m. Making a forecast for this region is more complicated than making a similar forecast for a typical onshore basin. These complications arise because exploration for oil and gas in the Gulf of Mexico has been both geographically and temporally restrained by economic, technical, legal, and philosophy-of-exploration factors.

19679 **(USGS/CHART/OC—106) Summary chart of geological data from the COST No. B-3 well, US Mid-Atlantic Continental Slope.** Schoole, P.A.; Schwab, K.A.; Krivoy, H.L. (Geological Survey, Arlington, VA (USA)). 1981. 18p. Geological Survey, 1200 South Eads Street, Arlington, VA 22202.

0203 Drilling And Production

REFER ALSO TO CITATION(S) 19674, 22031

19680 **(DOE/EV/04763—T1) Improved weather services for helicopter operations in the Gulf of Mexico. Final report.** Hilsenrod, A. (Federal Aviation Administration, Washington, DC (USA). Systems Research and Development Service). Jun 1981. Contract AC05-76EV04763. 84p. NTIS, PC A05/MF A01. Order Number DE83007915.

Current weather services in support of the more than 800 helicopters operating in the Gulf of Mexico is reviewed and the limitations noted. Means of improving these services based on currently available facilities and ongoing research and development efforts are presented. Immediate improvements in weather services can be attained by the implementation of a plan agreed upon by personnel of the FAA, NWS, and helicopter operators. Near-term (to 1986) and longer-term (beyond 1986) developments in observations, forecasts, and communications that can improve weather services are presented.

19681 **(DOE/NBM—3007519) Enhanced oil recovery by CO_2 foam flooding.** Patton, J.T. (New Mexico State Univ., Las Cruces (USA). Dept. of Chemical Engineering). Jul 1982. 154p. NTIS, PC A08/MF A01. Order Number DE83007519.

Experiments on gas mobility control, conducted in linear sand-pack models, show only a general correlation with the static foam test. In general, all surfactants which produce reasonable quantities of foam in the blender test also impart some degree of mobility control to gas during two-phase flow. The best mobility control additives, however, are only modest foam volume producers. Three basic chemical structures are promising for gas mobility control: Ethoxylated adducts of C_6 - C_{14} linear alcohols, sulfate ethers of ethoxylated C_9 - C_{16} linear alcohols, and low-molecular weight copolymers of ethylene oxide and propylene oxide. Some of the research effort centered on the rheology of foams. The efficacy of CO_2 mobility control in enhancing oil recovery was demonstrated experimentally. Flow tests were conducted with a viscous oil under immiscible displacement conditions. Mobility control increased recovery by 40% over a CO_2 enhanced waterflood and 93% over a conventional waterflood plus primary production. No adverse effects due to mobility control additives were noted. Mass transfer of CO_2 from the foam to the oil was not impleded. The experiment was performed without severe gas and liquid slugging.

19682 **(LBL—13600, pp 166-167) Enhanced recovery of heavy oils with alkali.** Radke, C.J.; Somerton, W.H. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1981.

Many oils, especially those classed as heavy oils, contain natural acids, such as alkyl and aryl carboxylics and porphyrins. In contact with aqueous alkalis, these acidic components can produce surface-active molecules that aid in oil displacement. The objective of this project is to study the fundamental mechanisms of alkali-enhanced oil recovery to permit better process design.

19683 **(USGS-OFR—82-242) Gulf of Mexico summary report 3. A revision of Outer Continental Shelf oil and gas activities in the Gulf of Mexico and their onshore impacts: Gulf of Mexico summary report 2, August 1981.** Havran, K.J.; Wiese, J.D.; Collins, K.M.; Kurz, F.N. (Rogers, Golden and Halpern, Inc., Reston, VA (USA)). Aug 1982. 137p. Office of OCS Information, Minerals Management Service, 12203 Sunrise Valley Drive, Reston, VA 22091.

This report is the latest in a series of annual reports summarizing current oil and gas activities in the Gulf of Mexico OCS and their onshore impacts. Oil production for 1981 was 0.27 billion barrels, and gas production was 4.84 trillion cubic feet. Most of the shallow-water areas of the Gulf of Mexico Continental Shelf have been explored. Industry has been developing the technology to explore deepwater areas, and interest in these portions of the Gulf is increasing. As of December 1981, the total of all identified oil and gas fields in the Gulf of Mexico OCS increased to 505 from 482 at the end of the previous year. The number of active fields increased from 466 in 1981, and fields for which reserve estimates have been made increased from 419 to 445. As of January 1982, 19,736 offshore oil and gas wells had been drilled in the Gulf of Mexico OCS; most of the wells (17,257) are off the coast of Louisiana. Currently, there are 2027 active oil and gas leases in the Gulf of Mexico; 1200 of them are producing leases. The Department of the Interior's 5-year OCS oil and gas leasing schedule projects 2 to 3 Gulf of Mexico lease sales per year through 1987, for a total of 12 offerings. Since 1972, oil production in the Gulf of Mexico has declined each year, and gas production, thought to have reached its peak in 1981, is also expected to begin a noticeable decline. To date, most of the oil and gas discovered in the Gulf has occurred on the Texas-Louisiana Shelf, but in the future, oil and gas exploration is likely to include a number of areas where previous leasing has not been extensive. Each year, hundreds of miles of pipelines are added to the existing network in the Gulf of Mexico. Recently, there have been a number of proposals for deepwater ports and transshipment terminals as well as projects including the deepening or widening of existing conventional ports. (DMC)

19684 **Fluidized bed combustion for oil field steam generation and process heating applications.** Davis, J.S.; Young, W.W.; Lyons, C.J. (Struthers Wells Corp). *Coal Technology;* 29-51(1981). (CONF-8111140—).

From 4. international coal utilization conference; Houston, TX, USA (17 Nov 1981).

A new approach for large oil field steam generators is examined. It utilizes lower value solid fuels such as coal, lignite, and petroleum coke. The use of solid fuels will result in approximately a

50% increase in net oil production without additional heat input by eliminating the liquid fuel requirements for current oil fired steam generators. The new approach has incorporated the technological advantages of Battelle's Multi-Solid Fluidized Bed Combustion (MS-FBC) and Struthers Thermo-Flood steam generators. The MS-FBC differs from conventional fluidized bed designs in its unique uncoupled arrangement of separated combustor and heat transfer sections. The solid-fueled design presented exhibits significant future applicability for cogeneration or combined cycles, and a range of critical process heating systems. This paper examines the application of this novel technology for solid-fuel Fired Dowtherm vaporizers and indirect heated, gas turbine power cycles. 6 refs.

19685 **(DOE/ER/10645—7) Multivariable process control: a survey.** Ray, W.H. (Wisconsin Univ., Madison (USA). Dept. of Chemical Engineering). 1982. Contract AC02-80ER10645. 28p. (CONF-8208113—1). NTIS (US Sales Only). Order Number DE83007322.

From International symposium on process systems engineering; Kyoto, Japan (1 Aug 1982).

A survey is provided of the state of the art in multivariable process control. Recent literature is organized and tabulated by topic to provide material for further study. The survey encompasses both linear and nonlinear multivariable systems, on-line estimation, adaptive control, distributed systems, and recent developments in computer-aided control system design. These developments together with recent applications provide the basis for predictions of the future evolution of the field. 396 references, 10 figures, 11 tables.

19686 **New concepts reduce process energy.** Humphrey, J.L. (Argonne Natl Lab, IL, USA). *Hydrocarbon Processing;* **61**: No. 7, 141-144(Jul 1982).

This paper presents results of a study of energy conservation in the following areas of technology: energy-efficient methods of separation; alternative fuels and feedstocks; recovery of low-level heat; and advanced concepts. Although the above technologies were identified and evaluated in terms of their application specifically to chemical plants and petroleum refineries, they have the potential of conserving oil and gas across a broad spectrum of industrial processes. Economic considerations are included in the study. 17 refs.

0205 Products And By-products

19687 **(PB—82-227810) Mini-assessment of environmental trends and problems: alternative feedstocks. Final report.** Burck, G.M.; Rio4dan, B.J.; Hoffman, K.C.; Meehan, R.W. II. (Mathtech, Inc., Arlington, VA (USA)). Jun 1982. 247p. NTIS, PC A11/MF A01.

This report discusses the potential for replacing oil and natural gas, the major organic chemical feedstocks, with alternative source materials and the consequent potential for environmental damage. Major emphasis is on five basic chemicals, and others are also considered. Current sources and uses of key chemicals are traced and a projection is made to the year 2000 under assumptions reflecting current market conditions. Three scenarios then define the upper limits for potential alternative feedstocks: (1) coal-based synthesis gas, (2) synfuel by-products, and (3) biomass.

0206 Health And Safety

REFER ALSO TO CITATION(S) 19738

19688 **(PB—82-233909) Well control in case of offshore blowout: oil collection on platforms. Final report.** Westergaard, R.H. (Sentralinstitutt for Industriell Forskning, Oslo (Norway)). Mar 1981. 13p. NTIS, PC A02/MF A01.

It is concluded that oil coming from a blowout through a diverter in principle can be recovered, but this is complicated and dangerous and not worth consideration because once successfully diverted, the blowout will most likely not last more than hours or a few days. The report concludes that use of special oil catchers and of knockdown nozzles in the rig holds too little promise to be worth working with. Spill collection trays under the drill floor and/or the cellar deck are considered interesting, and further work under the Statoil Project is recommended, particularly for Condeeps.

19689 **(PB—82-238296) Verification of cryogenic blowout control technology for offshore wells. Final report.** Powers, J.V.; Kuchar, W.E.; McClure, B.; Schwinkendorf, W.E.; Gregory, J. (BDM Corp., Albuquerque, NM (USA)). 2 Jun 1982. 55p. NTIS, PC A04/MF A01.

This report describes the BDM laboratory test program which successfully demonstrated the functional principle of a cryogenic blowout control device for offshore oil wells. The device, which would first be placed downhole as part of the casing string while drilling and later be part of the production tubing, is referred to as a Downhole Shut-In Device (DSD). This report is divided into six sections. Section B presents background material on blown-out oil wells and a description of the full scale DSD, section C summarizes the test program giving major results and conclusions, section D presents the detailed technical approach, section E gives test results, and F gives conclusions and recommendations.

19690 **(PB—82-239757) Well control in case of offshore blowout: collecting oil in the water. New concept based on using a separate underwater work base and a collection unit. Final report Oct 80-Mar 81.** Westergaard, Rich.H.; Wetlesen, T. (Sentralinstitutt for Industriell Forskning, Oslo (Norway)). Mar 1981. 26p. NTIS, PC A03/MF A01.

It seems possible to make underwater collection simpler and cheaper by combining a small and simplified collection unit with a proposed underwater work base.

19691 **(DOE/EIA—0008(82/2Q)) Energy information report to Congress: quarterly report. Second quarter, 1982.** (Department of Energy, Washington, DC (USA). Energy Information Administration). Sep 1982. 45p. NTIS, PC A03/MF A01. Order Number DE83008059.

This report was prepared in response to the mandate of Congress set forth in Public Law 93-319, Section 11 (c)(2), that requires for each calendar quarter a report that contains energy information including imports of crude oil, petroleum products, natural gas, and coal; reserves and production of crude oil, natural gas, and coal; refinery activities; and petroleum inventories.

19692 **(DOE/EIA—0032(82/01)) Monthly petroleum product price report.** Riner, C. (USDOE Energy Information Administration, Washington, DC. Office of Oil and Gas). Jan 1982. 18p. NTIS, PC A02/MF A01. Order Number DE83007897.

This report provides information on monthly national weighted average prices for refined petroleum products. The data published are the primary source of price data for refined products for the refining, reselling, and retailing sectors necessary for the Department of Energy (DOE) to execute its role in monitoring prices. In addition, the data provide the information necessary for Congress, DOE, and the public to perform analyses and projections related to energy supplies, demands, and prices. Price data in this publication were collected from separate surveys. Average prices are derived from a survey of refiners, large resellers and/or retailers, and independent gas plant operators. Data from this monthly survey are available from July 1975. Average No. 2 heating oil prices were derived from a sample survey of refiners, resellers, and retailers who sell heating oil. The geographic coverage for this report is the 50 states and the District of Columbia. Data are presented on the following: gasoline, No. 1 and No. 2 diesel fuels, No.

1 and No. 2 heating oils, residual fuel oil, aviation fuels, kerosene, and liquefied petroleum gases.

19693 **(DOE/EIA—0032(82/02)) Monthly petroleum product price report.** Riner, C. (USDOE Energy Information Administration, Washington, DC. Office of Oil and Gas). Feb 1982. 18p. NTIS, PC A02/MF A01. Order Number DE83008089.

19697 **(DOE/EIA—0032(82/07)) Monthly petroleum-product price report.** (USDOE Energy Information Administration, Washington, DC. Office of Oil and Gas). Jul 1982. 18p. NTIS, PC A02/MF A01. Order Number DE83008042.

This report provides Congress and the public with information on monthly national weighted average prices for refined petroleum products. the data published are the primary source of price data for refined products for the refining, reselling, and retailing sectors necessary for the Department of Energy (DOE) to execute its role in monitoring prices. In addition, the data provide the information necessary for Congress, DOE, and the public to perform analyses and projections related to energy supplies, demands, and prices. The legislative authority for this survey is the Federal Energy Administration Act of 1974 (PL 93-275). Price data in this publication were collected fronm separate surveys. Average prices are derived from a survey of refiners, large resellers and/or retailers, and independent gas plant operators. Data from this monthly survey are available from July 1975. Average No. 2 heating oil prices were derived from a sample survye of refiners, resellers, and retailers who sell heating oil. The geographic coverage for this report is the 50 states and the District of Columbia.

19698 **(DOE/EIA—0035(82/08)) Monthly energy review.** (Department of Energy, Washington, DC (USA). Energy Information Administration). Aug 1982. 105p. NTIS, PC A06/MF A01. Order Number DE83008092.

Current data and trends for production, consumption, stocks, imports, exports, and prices for the principal energy commodities in the United States are presented. Also included are data on international production of crude oil, consumption of petroleum products, petroleum stocks, and production of electricity from nuclear powered facilities. This report is published to keep the public and other interested parties fully informed with respect to current energy production, consumption, stocks, and prices.

19699 **(DOE/EIA—0035(82/12)) Monthly energy review.** (Department of Energy, Washington, DC (USA). Energy Information Administration). Dec 1982. 105p. NTIS, PC A06/MF A01. Order Number DE83008044.

Current data for production, consumption, stocks, imports, exports, and prices for the principal energy commodities in the United States are presented. Also included are data on international production of crude oil, consumption of petroleum products, petroleum stocks, and production of electricity from nuclear powered facilities.

19700 **(DOE/EIA—0109(82/03)) Petroleum supply monthly.** (USDOE Energy Information Administration, Washington, DC. Office of Oil and Gas). Mar 1982. 108p. NTIS, PC A06/MF A01. Order Number DE83008053.

Data are presented on the supply and distribution of petroleum and petroleum products in the USA during January, 1982. Included are statistics on production, consumption, imports, exports, stocks, and transport. A section discussing US petroleum developments during 1981 is also included. (DMC)

19701 **(DOE/EIA—0109(82/04)) Petroleum supply monthly.** (USDOE Energy Information Administration, Washington, DC. Office of Oil and Gas). Apr 1982. 116p. NTIS, PC A06/MF A01. Order Number DE83008054.

Data are presented on the supply and distribution of petroleum and petroleum products in the USA during February, 1982. Included are statistics on production, consumption, imports, exports, stocks, and transport during the same period. A section discussing the timeliness and accuracy of selected monthly petroleum data is also included. (DMC)

19702 **(DOE/EIA—0109(82/05)) Petroleum supply monthly.** (USDOE Energy Information Administration, Washington, DC. Office of Oil and Gas). May 1982. 109p. NTIS, PC A06/MF A01. Order Number DE83008057.

Data are presented on the supply and distribution of petroleum and petroleum products during March 1982, as well as data on production storage, imports, exports, and consumption. In addition, a section is included on the availability of motor gasoline for summer 1982. (DMC)

19703 **(DOE/EIA—0109(82/06)) Petroleum supply monthly.** (USDOE Energy Information Administration, Washington, DC. Office of Oil and Gas). Jun 1982. 117p. NTIS, PC A06/MF A01. Order Number DE83008056.

Data from a survey of US petroleum refineries are presented. The EIA refinery survey reveals that there has been a decline in the total number of operable refineries, from 324 on January 1, 1981, to 301 on January 1, 1982, while some refinery facilities are being upgraded to meet changing market conditions. Because of the introduction of more sophisticated equipment in a number of refineries, the industry is maintaining its flexibility to produce preferred fuels. Further, the survey also reveals that the US refining industry is equipped to meet expected levels of demand. Refinery Idle Capacity increased from 293,000 b/d to 1786 d/d from 1979 to 1982. The number and capacity of operable petroleum refineries are tabulated by PAD district and state. Crude oil and petroleum products supply and distribution data during April 1982 are included as well as data on crude oil and petroleum products imports from OPEC sources. (DMC)

19704 **(DOE/EIA—0109(82/07)) Petroleum supply monthly.** (USDOE Energy Information Administration, Washington, DC. Office of Oil and Gas). Jul 1982. 109p. NTIS, PC A06/MF A01. Order Number DE83008055.

Data are presented on the supply and disposition of crude oil and petroleum products in the USA during May 1982. In addition summary data are presented describing activities during the first 6 months of 1982. (DMC)

19705 **(DOE/EIA—0109(82/08)) Petroleum supply monthly.** (USDOE Energy Information Administration, Washington, DC. Office of Oil and Gas). Aug 1982. 107p. NTIS, PC A06/MF A01. Order Number DE83008064.

Data are presented on the distribution, production, imports, exports, and consumption of crude oil and petroleum products in the US during April 1982. A discussion of petroleum imports and exports is also included. (DMC)

19706 **(DOE/EIA—0109(82/09)) Petroleum Supply Monthly.** (USDOE Energy Information Administration, Washington, DC. Office of Oil and Gas). Sep 1982. 116p. NTIS, PC A06/MF A01. Order Number DE83008063.

Data are presented on the supply, distribution, production, storage, imports, exports, and consumption of petroleum and petroleum products in the US during July 1982. Crude oil and natural gas liquids plant production averaged 10.2 million barrels per day, up slightly from the 10.0 million barrels per day during the same period in 1981. Petroleum products supplied (a proxy for consumption) averaged 14.8 million barrels per day, down 5.8% from the 15.7 million barrels daily average for July of 1981. Refinery inputs of crude oil averaged 12.4 million barrels per day, a 1.5% increae over the previous July. Daily operable crude oil distillation capacity averaged 17.1 million barrels daily, compared with 18.7 million barrels daily a year earlier. The refinery utilization rate was 75.2% in July 1982, compared with 67.4% one year earlier. Total petroleum net imports averaged 5.0 million barrels per day, and the year-to-date level averaged 4.1 million barrels per day, compared with 5.5 million barrels per day for the first 7 months in 1981. Petroleum product stocks at the end of July 1982 were lower than year earlier levels, 782 million barrels compared with 880 million barrels. July 1982 residual fuel oil stocks were 10 million barrels lower than those a year earlier; and inventories of total motor gasoline at the end of July 1982 were 2 million barrels below the July 1981 level.

19707 **(DOE/EIA—0109(82/10)) Petroleum Supply Monthly.** (USDOE Energy Information Administration, Washington, DC. Office of Oil and Gas). Oct 1982. 104p. NTIS, PC A06/MF A01. Order Number DE83008017.

Data are presented on the supply and disposition of crude oil and petroleum products during August 1982. Data are also included on production, consumption, imports, exports, storage and transport of crude oil and petroleum products. A section is also presented summarizing the 1981 annual report of US crude oil, natural gas, and natural gas liquids reserves. (DMC)

19708 **(DOE/EIA—0109(82/11)) Petroleum supply monthly.** (USDOE Energy Information Administration, Washington, DC. Office of Oil and Gas). Nov 1982. 115p. NTIS, PC A06/MF A01. Order Number DE83008009.

Data are presented on the supply and distribution of crude oil and petroleum products during September 1982, as well as data on production, storage, imports, exports and consumption. Data are tabulated and analyzed according to PAD district. A section on trends in domestic crude oil production and reserves is included. Drilling activity has decreased in 1982 following the crude oil price decline that started in mid-1981. The energy Information Administration (EIA), therefore, expects that crude oil production wil decline during 1983 by about 110 thousand barrels per day from its projected 1982 level to average 8.5 million barrels per day. With crude oil production declining, net petroleum imports during 1983 are expected to be 750 thousand barrels per day above their projected average for 1982. The expected increase in imports will result from inceasing domestic petroleum consumption and decreasing petroleum stock withdrawals. Domestic crude oil production is expected to continue to decline through 1985. (DMC)

19709 **(DOE/EIA—0109(82/12)) Petroleum supply monthly.** (USDOE Energy Information Administration, Washington, DC. Office of Oil and Gas). Dec 1982. 103p. NTIS, PC A06/MF A01. Order Number DE83008088.

Data are presented on the supply, distribution, production, import, export and consumption of petroleum and petroleum products in the US during October, 1982. (DMC)

19710 **(DOE/EIA—0202(82/1Q)) Short term energy outlook. Volume I. Quarterly projections.** (USDOE Energy Information Administration, Washington, DC. Office of Energy Markets and End Use). Feb 1982. 65p. NTIS, PC A04/MF A01. Order Number DE83008097.

Updated forecasts are given for energy supplies, demand and prices at the national level with emphasis on petroleum. Individual forecasts are given for gasoline, distillate fuel oil, and residual fuel oil. Petroleum production, inventories, and imports are discussed. Natural gas, coal, and electricity are included. Changes in forecasting methodology were made in equations for electricity demand and for a group of petroleum products. Sensitivity case assumptions now include a factor reflecting uncertainty between preliminary data and model-estimates of demand and inventory changes. All methodological changes are detailed in the Appendices. (PSB)

19711 **(DOE/EIA—0202(82/2Q)-1) Short-term energy outlook. Volume 1. Quarterly projections.** (USDOE Energy Information Administration, Washington, DC. Office of Energy Markets and End Use). May 1982. 34p. NTIS, PC A03/MF A01. Order Number DE83008288.

This report provides projections for energy supplies, demands, and prices for the next several quarters and reviews recent major developments related to these projections. Three projections of petroleum supply and demand are presented based on low, medium, and high world oil price scenarios; however, the medium price scenario is emphasized. Detailed forecast tables are included at the end of the text. A section and table summarizing the world petroleum situation are included for the first time.

19712 **(DOE/EIA—0202(82/3Q)) Short-term energy outlook, quarterly projections.** (USDOE Energy Information Administration, Washington, DC. Office of Energy Markets and End Use). Aug 1982. 74p. NTIS, PC A05/MF A01. Order Number DE83008068.

The forecasts are produced using the Short-Term Integrated Forecasting System (STIFS). Two principal variables drive the STIFS model: the macroeconomic forecast and the world price of crude oil. The macroeconomic forecast, which is produced by Data Resources, Inc. (DRI), is adjusted by EIA in cases where EIA projections of the world price of crude oil differ from DRI estimates. The Oil Market Simulation Model is used to project the world oil price. The three projections for petroleum supply and demand are based on low, medium, and high world oil price scenarios. In general, the following discussion of the forecast refers to the medium price, or base case, scenario. Alternative cases, using varying assumptions about the level of economic activity, new car efficiency, weather, stock change uncertainty, and preliminary data uncertainty, are given for the forecasts of petroleum product demand and oil imports. Chapter 2 contains a substantially expanded coverage of developments in and the outlook for the world petroleum situation.

19713 **(DOE/EIA—0202(82/4Q)-1) Short-term energy outlook. Volume I. Quarterly projections.** (USDOE Energy Information Administration, Washington, DC. Office of Energy Markets and End Use). Nov 1982. 38p. NTIS, PC A03/MF A01. Order Number DE83008087.

The three projections for petroleum supply and demand based on low, medium, and high world oil price scenarios are revised. In general, the following discussion of the forecast refers to the medium price, or base case, scenario. Alternative cases, using varying assumptions about the level of economic activity, new-car efficiency, weather, stock change, and preliminary data uncertainty, are given for the forecasts of petroleum demand and oil imports.

19714 **(DOE/EIA—0361) Outlook for oil imports.** Lehr, M.D.; Zalkind, J. (USDOE Energy Information Administration, Washington, DC. Office of Energy Markets and End Use). Sep 1982. 23p. NTIS, PC A02/MF A01. Order Number DE83008073.

This report provides a detailed documentation concerning projections of oil imports to the United States. Two features characterize the oil import projections in all scenarios: (1) net oil imports are projected to reverse the decline of late 1981 and early 1982 and to climb to higher levels in 1985 than they held in 1981 or 1973 (though well below the peak in 1977); and (2) although varying trends are projected between 1985 and 1995, net oil imports through 1995 are never projected to recede below 2.6 million barrels per day, versus 5.1 in 1981. Payments for them are never projected to drop below 2.2% of the Gross National Product (GNP), versus 2.3% in 1981. The reversal and climb to higher import levels are projected because oil imports are the only readily usable fuel available in enough quantity to sustain economic growth during the next few years. The 1985 forecasts suggest that net oil imports will grow before price increases later in the decade and other factors can combine to bring about a gradual and permanent decline in oil imports. Varying trends are forecasted between 1985 and 1995 because of alternative assumptions about oil prices, economic growth, and domestic supply.

19715 **(LA—9677-MS) Economics of utility oil and gas substitution: national and region-specific analysis.** Mangeng, C.; Loose, V.; Stein, M.; Martinez, A.; Williams, D.; Bivins, R. (Los Alamos National Lab., NM (USA)). Feb 1983. Contract W-7405-ENG-36. 48p. NTIS, PC A03/MF A01. Order Number DE83008364.

Application of the Los Alamos Coal and Utility Modeling System to a region-specific analysis of utility substitution of coal and nuclear generation for oil- and gas-fired generation is described. Results indicate that adding new capacity according to the schedules announced by utilities in 1980 rather than more recently announced ones could save $33 billion in revenue requirements by the year 2010.

19716 **(NP—3901064) Swiss natural gas and petroleum research activities.** Frick, S.; Buechi, U.P. (Energieforum Schweiz, Bern (Switzerland)). 1981. 30p. (In German). NTIS (US Sales Only), PC A03/MF A01. Order Number DE83901064.

Topics covered include political and financial aspects and geological aspects. Individual sections were abstracted and indexed separately.

19717 **(P—102-82-002) Export restrictions on domestic oil: a California perspective.** Trexler, M.C. (California Energy Resources Conservation and Development Commission, Sacramento (USA)). Nov 1982. 153p. California Energy Commission, 1516 Ninth Street, Sacramento, CA.

As part of its ongoing investigation of California's energy security, the Energy Contingency Planning Committee of the California Energy Commission conducted a study of the West Coast implications of lifting export restrictions on domestic crude oil. In the past, significant impacts for California have been attributed to these export restrictions, particularly for Alaskan North Slope (ANS) oil. The Reagan Administration attempted to repeal these restrictions in 1981; another attempt is expected in 1983. Thi analysis shows that California has little to fear from a lifting of the export restrictions either in terms of its energy, economic, or environmental security. In addition, the incentive structure currently facing Alaskan oil producers makes exports only a marginally desirable option for them. The most significant decision variable for determining California's position on this issue may be its interest in promoting the economic well being of its Pacific Rim trading partners. Their security would be enhanced by access to secure supplies of United States domestic oil. Because California receives no benefits from the export restrictions on domestic oil, the state should support their removal in the interests of better Pacific Rim economic and political relations.

19718 **(PB—82-225996) California energy prices, 1980-2000. Staff report (final).** Cauchois, S.; Ward, D.; Merritt, M. (California Energy Resources Conservation and Development Commission, Sacramento (USA)). Jul 1981. 90p. NTIS, PC A05/MF A01.

California Energy Prices provides semiannual 20-year forecasts of electricity and primary fuel prices. Its purpose is to review current and past trends in energy prices as well as report on the California Energy Commission staff's periodic price forecasts made as part of the Biennial Report process.

19719 **(TVA—3901199) Tennessee energy statistics quarterly, third quarter 1982.** Johnson, K.L.; Matheny, R.R. (Tennessee Energy Authority, Nashville (USA)). Jan 1983. 35p. NTIS, PC A03/MF A01. Order Number DE83901199.

Energy production, consumption, and pricing are discussed. Data are tabulated for coal, petroleum, natural gas, and electricity. (PSB)

0208 Waste Management

REFER ALSO TO CITATION(S) 21702

19720 **(PB—82-231838) Emissions from refinery process heaters equipped with low-Nox burners. Final report Oct 80-Jan 81.** Todona, R.J.; Buening, H.J.; Hart, J.R. (KVB, Inc., Irvine, CA (USA)). Oct 1981. 183p. NTIS, PC A09/MF A01.

The report summarizes an investigation of the performance of commercial low-NOx burners in refinery process heaters. Refineries in Southern and Central California were surveyed to determine the number of existing or planned low-NOx burners. Tests on 10 process heaters equipped with low NOx burners measured gaseous emissions, particulates, and efficiencies at normal operating conditions. As-found NOx emissions increased from 58 to 245 ng/J as fuel-bound nitrogen increased from zero to 0.81%. In most cases, NOx concentrations were strongly influenced by excess air levels. Reducing excess air to 3-4% reduced NOx to 34-200 ng/J, depending on fuel nitrogen. Comparisons of present emissions data with past field test data for refinery heaters equipped with standard burners showed that (for mechanical-draft gas-fired heaters) low-NOx burners may reduce the NOx emission factor by 32-77% below the mean emission factor for standard burners. Three heaters (one firing gas; one, distillate oil; and one, residual oil) were selected as the most suitable candidates for 30-day continuous monitoring of gaseous emissions.

0209 Environmental Aspects

REFER ALSO TO CITATION(S) 19606, 19688, 19690, 19720, 21856, 21866, 21892, 21893, 22019, 22021

19721 **(AD-A—118372/2) Break-up of oil on rough seas - simplified models and step-by-step calculations. Final report.** Aravamudan, K.; Raj, P.; Ostlund, J.; Newman, E.; Tucker, W. (Little (Arthur D.), Inc., Cambridge, MA (USA)). Mar 1982. 199p. NTIS, PC A09/MF A01.

In this study, an attempt has been made to integrate the existing theoretical and experimental information regarding behavior of oil spills in the ocean into a unified, sequential calculation procedure. Major consideration has been given in the study to developing the least sophisticated calculation procedures which maintain a reasonable description of the totality of the physical processes. The principal phenomena included in the prediction of oil spill behavior are: combined spreading and evaporation, the interaction of waves within the slick with the slick and formation of oil droplets, dispersion of droplets in the water column and finally the formation and dispersion of slicklets due to turbulence in the ocean. The model has been exercised for four types of oils: light crude, heavy cruide, No. 2 fuel oil, and No. 6 fuel oil.

19722 **(AD-A—120221/7) The effects of weather systems, currents, and coastal processes on major oil spills at sea. Technical report.** Murray, S.P. (Louisiana State Univ., Baton Rouge (USA). Coastal Studies Inst.). 1982. 63p. NTIS, PC A04/MF A01.

Review of the effect of weather phenomena on continental shelves and coastal waters has clearly demonstrated their dominant role in forcing the motion of these waters. As the response of oil to wind forcing will be largely controlled by the type of weather characteristic of different climatic regions throughout the world, the paper will begin with a brief summary of the time and length scales of weather systems. Next, the oil dispersal problem will be discussed in terms of the physical and chemical properties of oil on the sea surface and then the geophysical processes (currents, tides, etc.) that experience has shown us to be important will be considered. Hydrodynamic details will not be emphasized, but rather case studies from major oil spills will next be called on to demonstrate the role of basic physical processes in determining oil motion. A brief review of the major types of models currently employed to aid in understanding or predicting oil spill movement will then be presented; it will be followed by a summary and evaluation of what I see to be the role physical oceanography will play in future oil spill incidents.

19723 **(AD-A—121827/0) Laboratory assessment of the changes in thermal properties of polar diving suit material when exposed to oils at low temperatures. Final report Sep 80-Feb 81.** Sinnarwalla, A.M.; Sundaram, T.R. (T.S. Associates, Inc., Columbia, MD (USA)). Feb 1981. 73p. NTIS, PC A04/MF A01.

The U.S. Coast Guard is evaluating the use of divers under ice as one means of oil-spill surveillance in arctic and subarctic regions. The degree of thermal protection provided to the diver by presently approved suits, which are made of neoprene foam lined on one or both sides by nylon fabric, under the combined action of oil, water and frigid temperature is not known. The present report describes the results of a laboratory study in which any changes in the thermal and physical properties of the suit material were assessed through systematic tests on small samples (12 in x 12 in) when they were kept immersed in various oils and oil-water mixtures at various temperatures (-4 c to +10 c) and periods of time (5 to 22 hours). Physical (length, volume, density) and thermal (conductivity) properties of the samples were measured before and after each test. The results show that, although the suit material performs well in general, under certain conditions the fabric lining as well as the foam absorb some oil and that this absorbed oil cannot be removed easily either by physical expression or by cleaning with commonly available detergents. The absorbed oil leads to some increases in density and in thermal conductivity, with the latter change for the 'Worst case' being about 35%.

19724 **(N—82-14557) Offshore petroleum industry environmental data requirements: emphasis on remote sensing.** Gratz, R.L. (Conoco Norway, Inc., Oslo). Jul 1981. 13p. NTIS, PC A13/MF A01.

ESA Appl. of Remote Sensing Data on the Continental Shelf.

Data quality and coverage requirements for the remote sensing of oceanographic and meteorological factors affecting the development of offshore hydrocarbon resources are considered, using a combination of fine-grid hindcasting and surface truth measurements. The establishment of data banks able to accumulate 20-30 years of climatological data for use in future designs is recommended. Special measurement programs are planned for data collection during storms. Remote sensing was used to measure several factors important to the petroleum industry, i.e., waves, winds, currents, and sea ice. Application to weather forecasting is shown. The use of surface truth data in the calibration and verification of measurements for remote sensing is suggested. Possible communications channels for the exchange of remote sensing data are assessed.

19725 **(N—82-14564) An evaluation of Seasat-A data in relation to optimum track ship weather routing and site specific forecasting for the offshore oil industry.** Daley, C.; Johnson, R.G.; Thomson, J.C. (Oceanroutes, Inc., Palo Alto, CA (USA)). Jul 1981. 10p. NTIS, PC A13/MF A01.

Appl. of Remote Sensing Data on the Continental Shelf.

The usefulness of Seasat-A SASS and altimeter measurements is reviewed. Five oceanic areas were selected: the Gulf of Alaska, central and western north Atlantic, eastern north Pacific, southern Indian Ocean, and the North Sea. Both Seasat-aided and conventional analyses were used in offshore hindcast and optimum ship routing situations. Where conventional observations are relatively dense, Seasat wind and wave data have greater impact in determining the shape of major map features than in positioning the features. In data sparse areas, Seasat data permit greater definition of surface features as well as their precise location. The use of Seasat data in optimum ship routing is quantified by means of comparative studies in the Gulf of Alaska.

19726 **(N—82-14573) The operational oil pollution surveillance system being used in France: forecasted future developments in consideration of the NATO/CCMS remote sensing pilot study conclusions.** Massin, J.M. (Ministere de l'Environment et du Cadre de Vie, Neuilly (France)). Jul 1981. 8p. NTIS, PC A13/MF A01.

Appl. of Remote Sensing Data on the Continental Shelf.

The requirements of an ideal system for detecting, identifying, classifying, mapping, and tracking oil spills are defined. A core package consisting of a human observer, photographic cameras, side-looking airborne radar, infrared/ultraviolet line scanner, and passive television is proposed. The French airborne remote sensing system is shown to satisfy these requirements. Problems with a remote sensing system able to operate under all weather conditions, transmitting specific information in real time which permits the identification of hydrocarbons without having to check in situ, are discussed. Satellite possibilities are estimated.

19727 **(N—82-14583) Oil spill identification by chemical analysis.** Grahl-Nielsen, O.; Wilhelmsen, S. (Bergen Univ. (Norway)). Jul 1981. 2p. NTIS, PC A13/MF A01.

Appl. of Remote Sensing Data on the Continental Shelf.

Gas chromatographic analyses of the relative amounts of phenanthrene and dibenzothiophene and their alkylated derivatives are shown to distinguish crude oils from different parts of the world and crude oils from different fields in the North Sea Ekofisk area. These aromatic hydrocarbons are relatively unaffected by weathering and can be used for matching oils from oil spills with unweathered samples from the suspected source. The method was used to identify the source of an oil spill in Bergen harbor. It is shown that analysis of the relative amounts of dibenzothiophenes is sufficient to discriminate between crude oils in most cases.

19728 **(N—82-14588) Use of side looking airborne radar (SLAR) for oil pollution monitoring in norway.** Hoest, S.E. (Norwegian Air Survey Co., Oslo). Jul 1981. 2p. NTIS, PC A13/MF A01.

Appl. of Remote Sensing Data on the Continental Shelf.

Integration of the system with a data annotation unit and a navigation system is outlined. Position data, date, time, and mission parameters are annotated on film. Data are also displayed on a TV monitor while the radar image and data can be recorded on an onboard video cassette recorder. The installation of the system and its operation are covered and its potential use in oil spill monitoring (particularly at night and in low visibility) is explained. Other possible uses are summarized (search and rescue missions, geology, oceanography) together with possible future extensions of the sensor package and survey aircraft.

19729 **(NP—3901018) Petroleum and pollution protection.** (Mineraloelwirtschaftsverband e.V., Hamburg (Germany, F.R.)). Oct 1981. 52p. (In German). NTIS (mf) (US Sales only).. Order Number DE83901018.

The variety of the influences of petroleum which affect the environment is demonstrated. It is to be pointed out that human existence is not possible without relying on the environment. Measures of the petroleum industry against the endangering of the environment by its products are described.

19730 **(OCS—76) Proposed 1983 outer continental shelf oil and gas lease sale offshore the Mid-Atlantic states. Final environmental impact statement.** (Minerals Management Service, New York (USA). Atlantic OCS Region). Dec 1982. 620p. Dept. of the Interior, Minerals Management Service, 18th & C Streets, NW, Washington, DC 20240.

The proposed action is the offering of a maximum of 4523 blocks (25.4 million acres; 10.3 million hectares) located from 8 to 195 statute miles offshore Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Delaware, Maryland, Virginia, and North Carolina for leasing in accordance with the Outer Continental Shelf Lands Act, as amended. The exact area to be offered will be based on the total number of unleased blocks wthin the boundaries of the proposed sale area at the time of the final Notice of Sale. Currently, there are 4416 unleased blocks within this area. The blocks lie in average water depths of 8 to 3550 meters (26 to 11,650 feet). In accordance with the 5-year OCS Oil and Gas Leasing Schedule, which was issued in July, 1982, Sale No. 76 will be held in April, 1983. Alternatives considered include a delay of the sale, cancelling the sale (no action), and three deletion options. The deletion options include one to protect biological resources, one to protect coastal resources, and one resulting from deepwater concerns. All blocks studied pose some degree of risk to the environment if developed. Mitigating measures, which may reduce the risk, have been identified.

19731 **(PB—82-231416) Oil spill response scenarios for remote arctic environments. Final report.** Schulze, R.H.; Grosskopf, W.G.; Cox, J.C.; Schultz, L.A. (Arctec, Inc., Columbia, MD (USA)). Mar 1982. 409p. NTIS, PC A18/MF A01.

Special problems occur during oil spill cleanup in remote inland areas in cold climates. In Alaska these problems result from the harsh climate, the unusual terrain features, and the special problems of spills along swift rivers. The analysis begins with a description of the environmental conditions that occur in Alaska that affect oil spill behavior and oil spill cleanup. The study then describes four spill scenarios in remote areas giving engineering details of the mechanics of the spill movement and the cleanup effort. One scenario covers a winter blowout of a well on the north slope tundra. The next involves a Trans-Alaska Pipeline spill. The fourth scenario involves a fuel tank truck spill into a sensitive sport fishing stream. The study describes the impact of these spills on the environment. Further, it provides a numerical evaluation of the effectiveness of the spill response effort and the cost effectiveness of three incremental levels of spill response for the cleanup effort.

19732 **(PB—82-255837) Manual of practice - chemical treating agents in oil spill control. Final report Sep 77-Dec 80.** Castle, R.W.; Foget, C.R.; Schrier, E. (Woodward-Clyde Consultants, San Francisco, CA (USA)). Jun 1982. 152p. NTIS, PC A08/MF A01.

The purpose of this manual is to provide the On-Scene Coordinator (OSC) with a systematic methodology consistent with national policy that can be used to assess the case-by-case acceptability of oil spill treatment using chemicals, and to determine appropriate application procedures. It contains guidelines for evaluating spill safety, determination of relevant spill characteristics, prediction of treated and non-treated spill movement, and criteria for comparison of probable impacts with and without treatment. Dispersion of oil at sea, dispersion on the shoreline, and the use of surface collecting agents are considered. The manual additionally describes general chemical agent application procedures and dosage regulation.

19733 **(PB—82-256116) Field manual for oil spills in cold climates. Final report Sep 78-May 79.** Deslauriers, P.C.; Morson, B.J.; Sobey, E.J. (Science Applications, Inc., Boulder, CO (USA)). May 1982. 177p. NTIS, PC A09/MF A01.

This manual documents the state-of-the-art response techniques as of early 1979. The manual has been divided into two basic parts: A field manual and supporting data. The field manual consists of a set of matrices that summarizes applicable techniques for various conditions. The on-scene coordinators will be able to use the matrices as a quick reference while they are responding to spills. The supporting data are a detailed summary of information on oil behavior and cleanup techniques. It was assumed that on-scene coordinators would have the opportunity to become knowledgeable enough about the material in this section so that only quick references to the field manual would be needed while responding to spills. It is also hoped that the on-scene coordinators will have had time to gather the information suggested (for example, maps delineating habitats and access roads) before the spill occurs. The ultimate success or failure of a response to an oil spill in cold regions will largely hinge on the on-scene coordinator's understanding of the information presented here and on his knowledge of the area in which the spill occurred.

19734 **(PB—83-114165) Results of an adaptive environmental assessment modeling workshop concerning potential impacts of drilling muds and cuttings on the marine environment. Workshop summary.** Auble, G.T.; Andrews, A.K.; Ellison, R.A.; Hamilton, D.B.; Johnson, R.A. (Fish and Wildlife Service, Fort Collins, CO (USA). Western Energy and Land Use Team). Oct 1982. 79p. NTIS, PC A05/MF A01.

This publication summarizes findings of a workshop held September 14-18, 1981, under a Federal Interagency Energy/Environment Agreement between the U.S. Environmental Protection Agency and the U.S. Fish and Wildlife Service. The U.S. EPA Environmental Research Laboratory, Gulf Breeze, Florida, was host for the sessions held on Pensacola Beach, FL. Discussions focused on information pertaining to fate and effects, identification of general relationships between drilling mud fluids and the marine environment, and identification of site-specific variables likely to determine impacts of drilling muds and cuttings in various marine sites. The workshop was structured around the construction of a model simulating fate and effects of discharges from a single rig into open waters of the Gulf of Mexico.

19735 **(PB—83-114538) Testing truck-mounted vacuum and air conveyor systems for oil spill recovery.** Gates, D.C.; Corradino, K.M. (Mason and Hanger-Silas Mason Co., Inc., Leonardo, NJ (USA)). Oct 1982. 43p. NTIS, PC A03/MF A01.

Two different vacuum truck designs were evaluated for oil recovery performance at the U.S. Environmental Protection Agency's Oil and Hazardous Materials Simulated Environmental Test Tank (OHMSETT) facility in September 1980. These were a Vactor Model 2045 air conveyor design made by the Meyers-Sherman Company and a standard vacuum truck made by Coleman Environmental and Pollution Control Equipment Co., Inc. Changes in recovery efficiency and oil recovery rate were found while varying oil slick thickness, oil viscosity, hose length, and air pump speed for the trucks. The air conveyor was additionally tested using different suction hose heights above the slick.

19736 **(PML—1979-41) Pollution of the soil by aviation gasoline.** Verweij, A. (Prins Maurits Lab. TNO, Rijswijk (Netherlands)). Aug 1979. 26p. (In several languages). NTIS, PC A03/MF A01.

A literature search was conducted to determine the effects of aviation gasoline spills and more general oil spills on the environment and on the condition of oil storage tanks. Remedial measures are presented. Attention is given to natural restoration processes as well as to actions to speed up these processes.

19737 **The cost of environmental regulations to the United States petroleum industry.** Sheppard, W.J. (Battelle Memorial Institute, Columbus, OH). *Oil and Petrochemical Pollution;* 1: No. 1, 49-57(1982).

Estimates of environmental control costs to the U.S. petroleum industry through 1990 are presented. No attempt has been made to compare the pollution control cost with the benefits of an improved environment. The cost is estimated between $16 and 65 billion, and the energy requirements are equivalent to a large refinery's capacity. Given the large costs, a careful benefit-cost analysis was recommended. (JMT)

19738 **Identification of mutagenic compounds in extracts of diesel exhaust particulates. Paper 81.56.1.** Petersen, B.A.; Chuang, C.C.; Margard, W.L.; Trayser, D.A. (Battelle, Columbus Lab, OH, USA). *Proceedings, Annual Meeting, Air Pollution Control Association;* vp(1981). (CONF-810631—).

From 74. annual meeting of the Air Pollution Control Association; Philadelphia, PA, USA (21 Jun 1981).

Exhaust gases form diesel engines were analyzed using different approaches and instruments to study the complex mixture of carbonaceous matter and gaseous components. The results demonstrate that a number of oxygenated polynuclear aromatic hydrocarbons (PAH) are present and also readily react with dilute nitric acid, particularly pyrene. They form nitrate derivatives which are powerful mutagens. 5 refs.

REFER ALSO TO CITATION(S) 19622, 19742, 19743

19739 **(KFK-PDV—222) Pipeline leak detection and location.** Courage, C.; Herforth, H.; Jansen, J.; Laier, D. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Prozesslenkung mit DV-Anlagen). Aug 1982. 63p. (In German). NTIS (US Sales Only), PC A04/MF A01. Order Number DE83750184.

The currently operational facilities for detecting and locating leakages in pipelines are only suitable to a limited extent for continuous monitoring in all operating phases. Using a computersimulated pipeline, various procedures were tested which offered potential improvements. The tests were concentrated on the detection and location of leakages under non-stationary operating conditions using the available measuring instruments. This made the use of a computer for the monitoring essential. Good results were shown by one procedure which gains important information from an on-line simulation on the variations with time of pressure and flow rate of a fluid pipeline. These reference values allow a comparison to be made with the measured values in all operating conditions. A special digital filter is used for leak detection. The measuring instruments need only fulfil minimum requirements concerning absolute accuracy.

19740 **(PB—82-239773) The inland distribution of the products of North Sea oil.** Pike, J. (Newcastle upon Tyne Univ. (UK). Transport Operations Research Group). Jan 1982. 37p. (RR—42). NTIS, PC A03/MF A01.

The objectives of the study were to assess the impact of the introduction of North Sea oil, in terms of: The proportions of production landed ashore and exported, as well as the factors conditioning this balance; the likelihood of the balance remaining stable in relation to future levels of output; the methods employed in bringing the crude ashore, e.g. size of vessels used, pipelines, the ports of landing and quantities received at each; the siting of new refineries and the type and timing of new port facilities to handle increased levels of production; the impact on the utilization of the existing capacity of the coastal fleet; ownership patterns of the existing fleet, future policies in relation to offshore oil and other traffic; and the impact on inland distribution patterns.

19741 **Flowmeter for determining average rate of flow of liquid in a conduit.** Kennerly, J.M.; Lindner, G.M.; Rowe, J.C. (to Dept. of Energy). US Patent 4,364,269. 21 Dec 1982. Filed date 30 Apr 1981. vp.

PAT-APPL-258971.

This invention is a compact, precise, and relatively simple device for use in determining the average rate of flow of a liquid through a conduit. The liquid may be turbulent and contain bubbles of gas. In a preferred embodiment, the flowmeter includes an electrical circuit and a flow vessel which is connected as a segment of the conduit conveying the liquid. The vessel is provided with a valved outlet and is partitioned by a vertical baffle into coaxial chambers whose upper regions are vented to permit the escape of gas. The inner chamber receives turbulent downflowing liquid from the conduit and is sized to operate at a lower pressure than the conduit, thus promoting evolution of gas from the liquid. Lower zones of the two chambers are interconnected so that the downflowing liquid establishes liquid levels in both chambers. The liquid level in the outer chamber is comparatively calm, being to a large extent isolated from the turbulence in the inner chamber once the liquid in the outer chamber has risen above the liquid-introduction zone for that chamber. Lower and upper probes are provided in the outer chamber for sensing the liquid level therein at points above its liquidintroduction zone. An electrical circuit is connected to the probes to display the time required for the liquid level in the outer chamber to successively contact the lower and upper probes. The average rate of flow through the conduit can be determined from the above-mentioned time and the vessel volume filled by the liquid during that time.

19742 **(AD-A—119019/8) A-e Services to perform a cathodic protection survey of the bulk fuel terminals at N.S.C. Pearl Harbor, Hawaii. Volume I. Report for Aug 81-May 82.** (Pacific Corrosion Research, Inc., Huntington Beach, CA (USA)). Jun 1982. 420p. NTIS, PC A18/MF A01.

The purpose of this corrosion survey was to inspect and checkout the existing cathodic protection systems of the underground metallic fuel lines and tanks at the Bulk Fuel Terminal, Naval Supply Center, Pearl Harbor, Hawaii. The corrosion survey was conducted from August 1981 to May of 1982. The corrosion survey was conducted on the following fuel tanks and fuel lines under Contract N62742-81-C-0006. The corrosion evaluation survey was conducted on the following fuel lines under Contract N62742-81-C-0006/P00002.

19743 **(AD-A—119026/3) A-e Services to perform a cathodic protection survey of the bulk fuel terminals at N.S.C. Pearl Harbor, Hawaii. Volume II.** (Pacific Corrosion Research, Inc., Huntington Beach, CA (USA)). Jun 1982. 296p. NTIS, PC A13/MF A01.

This section includes one 25,000 bbl, two 80,000 bbl, and two 150,000 bbl tanks in the Pearl City Tank Farm. Tanks in the upper tank farm consist of six 150,000 bbl tanks, eight underground diesel storage tanks at building 60, four 10,000 bbl underground surge tanks, two ballast tanks, two diesel tanks, one hot settling tank and one diesel flotation tank. Four 50,000 bbl tanks and one 80,000 bbl tank at the middle tank farm are included along with four 50,000 bbl tanks at the lower tank farm. One outdoor ballast tank and one water storage tank at the Stilling Basin and associated piping are also included. The existing impressed current type of cathodic protection system and the existing sacrificial type of cathodic protection system are considered and three POL lines located in the lower Red Hill Tunnel from the Red Hill storage tanks to the Pearl Harbor Naval Base are included.

19744 (DOE/EP—0045/1) Strategic Petroleum Reserve. Annual report. (USDOE Assistant Secretary for Environmental Protection, Safety and Emergency Preparedness, Washington, DC. Office of the Deputy Assistant Secretary for Strategic Petroleum Reserve). 16 Feb 1983. 17p. NTIS, PC A02/MF A01. Order Number DE83008298.

This report discusses Reserve development activities during 1982 and includes: a detailed statement of the status of the Reserve; a summary of the actions taken to develop and implement the SPR Plan; an analysis of the impact and effectiveness of such actions on the vulnerability of the United States to interruption in supplies of petroleum products; a summary of existing problems with respect to further implementation of the SPR Plan; and any recommendations for supplemental legislation deemed necessary or appropriate by the Secretary of Energy to implement the Reserve Program. During 1982, the significant events for the Strategic Petroleum Reserve (SPR) Program included continued high oil acquisition and fill rates, execution of a second commercial crude oil purchase contract with the Mexican state oil company, continued Phase II storage capacity development, continuation of Phase III design and construction at expansion sites, submission to the Congress of a new drawdown plan, required under the Energy Emergency Preparedness Act of 1982, for use of the nation's SPR in case of a severe energy supply disruption, and submission of a report to the President and the Congress on the size of the SPR. Phase I development of five storage sites to achieve the capability to store 260 million barrels of oil was completed in 1980. Development of Phase II storage facilities (290 million barrels) continued on schedule during 1982 with cavern leaching at Bryan Mound, West Hackberry, and Bayou Choctaw and oil fill at Bryan Mound and West Hackberry. As of December 31, 1982, a total of 293.8 million barrels of crude oil was stored in the Strategic Petroleum Reserve.

19745 (DOE/EP—0046/4) Strategic Petroleum Reserve. Quarterly report. (USDOE Assistant Secretary for Environmental Protection, Safety and Emergency Preparedness, Washington, DC. Office of the Deputy Assistant Secretary for Strategic Petroleum Reserve). 15 Feb 1983. 12p. NTIS, PC A02/MF A01. Order Number DE83008365.

During the first quarter of FY 1983, the Department of Energy continued to expand the storage capacity of the Strategic Petroleum Reserve (SPR) and to fill available storage capacity in the Reserve through purchases made in FY 1982. The SPR is being developed in three phases. Development of Phase I of the program consisting of approximately 260 million barrels of capacity (an increase of approximately 10 million barrels over prior estimates due to the acceptance of Sulphur Mines Cavern 2-4-5) was completed in 1980. Development of Phase II storage of 290 million barrels continues on schedule with the solution mining of the first three caverns completed in December 1982. Phase III construction at Bryan Mound is ongoing with drilling activities approximately 70 percent complete. Big Hill detailed design is nearing completion, and approximately 294 acres of land for the site were condemned in December 1982. The SPR was filled at a rate of 173,288 barrels per day during the calendar quarter ending December 31, 1982, and the total SPR crude oil inventory at the end of this period was 293,826,909 barrels. The weighted average cost of crude oil delivered to SPR terminals from October 1, 1982, through December 31, 1982, was $34.16 per barrel. Market conditions continue to be favorable for the purchase of oil to fill available SPR storage capacity. The SPR Petroleum Account became off-budget in FY 1982 pursuant to the Omnibus Budget Reconciliation Act of 1981. Funds for storage facilities development and operations, planning, and program direction continue to remain on-budget. Congress appropriated $2.074 billion to the PSR Petroleum Account for FY 1983.

19746 (DOE/PE/70267—T1) Strategic petroleum reserve: progress after seven years. Glatt, S. (Resources for the Future, Inc., Washington, DC (USA)). Jul 1982. Contract AC01-80PE70267;AC02-76CH00016. 132p. NTIS, PC A07/MF A01. Order Number DE83007162.

The goal of this work is to provide a single source of information on the SPR program, including its legislative and administrative bases, and to provide background for ongoing analyses of stockpiling issues. This report examines the SPR program by focusing on major matters of contention. These include its size, appropriate type of fill, choice of storage facilities, drawdown and distribution plans, procurement policies, financing options, costs, and role of the private sector. It describes the decisions made and actions taken which bear on these and related issues. The paper includes an extensive list of sources of information and analysis. This study brings together many of the major issues to present a comprehensive picture of the program in its development through early 1982. The discussion highlights difficulties in implementing a large, complex economic and engineering program. Chapter 1 gives a description of the background of strategic and critical materials stockpiling in this country, which places the Strategic Petroleum Reserve in its historical context. Chapter 2 examines the specific course of legislation which led to the establishment of the SPR and documents its present status. In Chapter 3, issues addressed by the policy makers are presented and the major issues of the size of the Reserve, types of storage facilities, location of the Reserve, type of fill, oil procurement strategies, drawdown and distribution, financing, industrial and private sector participation, and costs are discussed. The decisions taken and the yet unanswered questions are examined. Lastly, strategic stockpiling efforts in Japan, France, West Germany, Italy, and the Netherlands are reviewed to give a measure of comparison with the US SPR program. (DMC)

19747 (GAO/RCED—83-29) Status of strategic petroleum reserve activities as of September 30, 1982. (General Accounting Office, Washington, DC (USA). Resources, Community and Economic Development Div.). 15 Oct 1982. 32p. General Accounting Office, P.O. Box 6015, Gaithersburg, MD 20760.

During fiscal year 1982, about 78.6 million barrels of oil were delivered to the Strategic Petroleum Resrve, for an annual average fill rate of about 215,300 barrels per day. As of September 30, 1982, the Department of Energy reported that the Reserve contained about 277.9 million barrels. This report discusses a number of significant events, which occurred during the fourth quarter of fiscal year 1982, that affect the Reserve. It also discusses the progress being made in developing additional storage capacity for the Reserve.

19748 (PB—83-117069) Mechanisms of NO/sub x/ formation and control: alternative and petroleum-derived liquid fuels. England, G.C.; Heap, M.P.; Pershing, D.W.; Nihart, R.K. (Energy and Environmental Research Corp., Santa Ana, CA (USA)). 1981. 14p. NTIS, PC A02/MF A01.

The paper gives results of burning petroleum-, coal-, and shale-derived liquid fuels in a downfired tunnel furnace to assess the impact of fuel properties on the formation and control of NO/sub x/ emissions. A nitrogen-free oxidant mixture (Ar, CO_2, O_2) was used to isolate fuel NOx formation. Under excess air conditions, fuel NOx correlated well with total fuel nitrogen content for both the petroleum and alternate fuels. Under staged combustion conditions, the influence of fuel nitrogen content was much less pronounced but equally highly correlated except for coal-derived liquid. Exhaust NOx emissions were directly related to the amount of oxidizable nitrogen species leaving the first stage. NO, HCN, and NH_3 concentrations were measured in the fuel-rich zone of the staged combustor as a function of stoichiometry for seven liquid fuels and one CH_4/NH_3 mixture. Similar characteristics were observed for all liquid fuels. As the first stage stoichiometry (SR1) was reduced, NO concentrations at the first stage exit decreased; however, below SR1 = 0.8, HCN and NH_3 concentrations increased. Thus, the total fixed nitrogen (TFN = NO + HCN + NH_3) concentration passed through a minimum. Experimental data also indicated that increasing the temperature of the fuel-rich zone decreased TFN concentration which resulted in reduced exhaust NOx emissions.

03 NATURAL GAS

19749 **(PB—82-220559) Thermal endurance of construction materials at LNG facilities. Final report Oct 80-Sep 81.** Newman, J.S.; Vincent, B.G. (Factory Mutual Research Corp., Norwood, MA (USA)). Nov 1981. 109p. NTIS, PC A06/MF A01.

Construction materials utilized at LNG facilities are required to meet certain standards set by regulatory authorities and/or company specifications. Thermal endurance requirements are included in these standards and specifications and do, for the most part, refer to endurance tests conducted by nationally recognized approval and testing agencies. However, the tests performed by these agencies do not truly simulate the potential exposure afforded by contact with either LNG or an LNG fire. The objective of this program was to develop, in conceptual form, a test method or methods which could be used to effectively evaluate the thermal endurance of various construction materials in use at LNG facilities.

19750 **(DOE/ET/12140—1346) Final report of special geological, geochemical, and petrological studies of the Devonian shales in the Appalachian Basin.** Potter, P.E.; Maynard, J.B.; Pryor, W.A. (Cincinnati Univ., OH (USA). H.N. Fisk Lab. of Sedimentology). Jan 1980. Contract AC21-76ET12140. 97p. NTIS, PC A05/MF A01. Order Number DE83006387.

The purpose of this study was to describe the geology, petrology, lithology, sedimentology, and stratigraphy of the Devonian Shales in the Appalachian Basin in order to determine the potential for gas recovery. Specific study areas include Pine Mountain Overthrust, Brallier Formation, and Ohio Shale along Lake Erie. discussion is presented under the main headings: Chemical Characterization;composition, Fabric, Texture, Bedding, and paleontology; and Basin Analysis. Paleocurrent studies indicate that the depositional strike of the basin in upper Devonian time was north-south with but little variation and that sediment was uniformly derived from the east. The total volume of shale sequence in the Pine Mountain Overthrust is 254 cubic miles. The blowout zone of Young (1957) was identified stratigraphically. The siltstones of the Brallier Formation are of rather low primary reservoir quality. Similar tight siltstones in the Benson Field of West Virginia show moderate gas production. Mudrock in Brallier outcrops do not show promise as source rock. Stratigraphic units along Lake Erir, which contain abundant mudshales, siltshales, and siltstones, make the best gas reservoirs. All of these shale types contain quartz laminae and/or quartzase siltstone and siltshale beds which act as permeable reservoirs and conduits for gas even though some are cemented by carbonate. (DMC)

19751 **(PB—82-231648) Gas saturation in formation waters: Volume 1. Annual report Apr 80-Mar 81.** Randolph, P.L.; Rockar, E.M.; Osif, T.L. (Institute of Gas Technology, Chicago, IL (USA)). May 1981. 74p. NTIS, PC A04/MF A01.

Understanding the chemistry of brines from geopressured-geothermal formations is essential to the determination of the economics of production. This understanding is achieved by obtaining and analyzing down-hole (in-situ) fluid samples. The analytical results are compared to the results of surface sample analysis and to the results of thermodynamic modeling of this system.

19752 **(PB—82-231655) Gas saturation in formation waters: Volume 2. Annual report Apr 80-Mar 81.** Randolph, P.L.; Rockar, E.M.; Osif, T.L. (Institute of Gas Technology, Chicago, IL (USA)). May 1981. 147p. NTIS, PC A07/MF A01.

The purpose of this project is the development of a method for calculation of chemical equilibrium in support of Institute of Gas Technology Prime Contract No. 5011-321-0140 with the Gas Research Institute. The thrust of IGT's project is to develop laboratory capability for accurate analysis of brine samples recovered under in-situ conditions from geopressurized zones of coastal Texas and Louisiana.

19753 **(DOE/EI/10754—T17) Review of FRS and complementary pipeline data.** (Synergy, Inc., Washington, DC (USA)). 26 Oct 1981. Contract AC01-81EI10754. 60p. NTIS, PC A04/MF A01. Order Number DE83007290.

The potential for supplementing the Financial Reporting Systems (FRS) data collection system with data collected by the Federal Energy Regulatory Commission (FERC) for interstate natural gas pipeline companies. The approach here is to evaluate the potential for merging the FRS with the FERC Form 2 data in order to obtain additional information about interstate natural gas pipeline companies. A line-item by line-item comparison of the EIA-28 FRS form and the FERC Form 2 was made, both in a conceptual manner and by comparing actual data to determine if one form could be built from the other, and how much additional information could be provided by combining the two forms. Actual data were reviewed in order to evaluate that potential.

19754 **(DOE/EIA—0130(82/10)) Natural gas monthly.** (USDOE Energy Information Administration, Washington, DC. Office of Oil and Gas). Oct 1982. 107p. NTIS, PC A06/MF A01. Order Number DE83008094.

This report, the Natural Gas Monthly (NGM), presents monthly and annual state and national level information on the supply and disposition of natural gas. in particular, the NGM includes data on natural gas production, storage, imports, exports, and consumption. Selected data are also presented on the activities of the major interstate pipeline companies, and on filings with the Federal Energy Regulatory Commission under the Natural Gas Policy Act of 1978. Marketed production of natural gas during the 6-month period ending June 1982, declined by 5.7 percent compared to a similar period in 1981, while wellhead prices rose from a 1981 average of \$2.00 to a level of \$2.29 in June 1982. Sales of natural gas by major interstate pipelines followed the same pattern of lower volumes and higher prices. Natural gas injected into storage is running slightly ahead compared to amounts injected last year.

US proved reserves of natural gas as of December 31, 1981, were 201,730 billion cubic feet, an increase of 1.4 percent over the 1980 level.

19755 **(DOE/EIA—0130(82/11)) Natural gas monthly.** (USDOE Energy Information Administration, Washington, DC. Office of Oil and Gas). Nov 1982. 96p. NTIS, PC A05/MF A01. Order Number DE83008095.

This report presents data on the supply and disposition of natural gas in the USA during July 1982, as well as data on production, storage, imports, exports, and consumption. Selected data are also presented on the activities of the major interstate pipeline companies. Volumes of natural gas in storage continue to run slightly ahead of year-ago levels, especially for interstate operators. Weighted average prices received for gas sold by major interstate pipeline companies during July of 19982 ranged from a low of $2.61 per thousand cubic feet (Mcf) for Kansas-Nebraska to a high of $7.09 per Mcf for Pacific Gas. These variations are attributable to the sources of supply available to the various pipeline companies and the market structures of each. September 1982 applications for determination of a maximum lawful price under the Natural Gas Policy Act (NGPA) increased slightly for new gas (Section 102) and decreased significantly for high-cost gas (Section 107) when compared to August. Natural gas ceiling prices prescribed by the NGPA continued to move upward through the application of prescribed monthly inflation adjustments. In the 3-year period from November 1979 through November 1982, the price ceiling for new gas, for example, increased from $2.314 to $3.249 per million (MM) Btu's. The highest ceiling price permitted under the NGPA is natural gas produced from tight formations set for November 1982 at $5.396 per MMBtu. Market natural gas production during September of 1982 was 1444 billion cubic feet (Bcf) compared to the September 1981 level of 1578 Bcf. Consumption during the same period also declined from 1266 Bcf to 1176 Bcf.

19756 **(DOE/EIA—0130(82/12)) Natural gas monthly.** (USDOE Energy Information Administration, Washington, DC. Office of Oil and Gas). Dec 1982. 92p. NTIS, PC A05/MF A01. Order Number DE83008289.

This report presents data on the supply and disposition of natural gas in the USA during August 1982, as well as data on production, storage, imports, exports, and consumption. Selected data are also presented on the activities of the major interstate pipeline companies. Marketed production of natural gas decreased 18.2% during August 1982, compared to August 1981, from 1706 billion cubic feet (Bcf) to 1471 Bcf. Consumption during the same period declined as well, from 1314 Bcf to 1153 Bcf. Commencing with this issue of the Natural Gas Monthly (NGM), estimates of marketed production are provided for two more recent months, September and October. Volumes of natural gas in storage continue to run slightly ahead of year-ago levels. The volume of natural gas purchased from producers and imported by major interstate natural gas pipeline companies continues to decline. In August 1981, 864 Bcf were purchased from producers, compared to 793 Bcf in August 1982. Imports during the same period declined from 62 Bcf to 46 Bcf. Applications for determination of a maximum lawful price under the Natural Gas Policy Act (NGPA) showed a significant increase between September and October 1982. The increase occurred principally for Section 103 classification wells (new onshore production wells), and for Section 107 classification wells (high-cost natural gas).

19757 **(DOE/EIA—0145(81)) Statistics of interstate natural gas pipeline companies: 1981.** Mack, J. (USDOE Energy Information Administration, Washington, DC. Office of Oil and Gas). Oct 1982. 275p. NTIS, PC A12/MF A01. Order Number DE83008781.

This report presents financial and operating information on all Class A and B interstate natural gas pipeline companies operating in the United States during 1981. For accounting and reporting purposes, the FERC's Uniform System of Accounts defines Class A and B companies as follows: (1) Class A companies are those having annual gas operating revenues of $2,500,000 or more, and (2) Class B companies are those having annual gas operating revenues of more than $1,000,000 but less than $2,500,000. The 1981 financial and operating information presented in this report indicates that the 93 Class A and B interstate natural gas pipeline companies reported assets totaling $58.3 billion, as of December 31, 1981, compared with $48.8 billion on December 31, 1980. Gross gas utility plant investments at the end of the year amounted to $40.1 billion ($35.5 billion); and net gas utility plant assets amounted to $21.8 billion ($19.0 billion). The Class A and B pipeline companies reported total gas operating revenues of $55.7 billion ($45.3 billion), reflecting the effects of inflation and higher purchased gas costs. Sales of natural gas increased from 17.3 trillion cubic feet in 1980 to 17.8 trillion cubic feet in 1981. Sales of natural gas to ultimate consumers and to other gas utilities amounted to 3.3 trillion cubic feet (2.9 trillion cubic feet) and 14.5 trillion cubic feet (14.4 trillion cubic feet), respectively.Revenues from these sales amounted to $11.2 billion ($8.0 billion) and $42.1 billion ($35.3 billion). The total number of natural gas customers was 6,429,447 in 1981, compared with 5,274,757 in 1980. Of these, ultimate consumers totaled 6,426,546 (5,271,709) and 2901 (3048) wholesale gas utility customers.

19758 **(DOE/EIA—0357) Analysis of post-NGPA interstate pipeline wellhead purchases: an analysis of the Natural Gas Policy Act and several alternatives, Part III.** (USDOE Energy Information Administration, Washington, DC. Office of Oil and Gas). Sep 1982. 159p. NTIS, PC A08/MF A01. Order Number DE83008025.

The purpose of this report is to analyze the market for natural gas at the wellhead as seen by major interstate pipeline companies. Among the issues addressed are: (1) what volumes of the various categories of natural gas are being purchased by interstate pipeline companies and what prices are being paid; (2) how much variation is there among companies in their average purchase prices of gas. How has the variation changed during the past year; (3) is there any evidence that old gas supplies are being reclassified to take advantage of higher price ceilings on new gas categories; and (4) what explains the volumes and prices of high-cost gas purchases. The data for the analysis presented here come from the Purchased Gas Adjustment (PGA) filings submited by major interstate pipeline companies to the Federal Energy Regulatory Commission and are presented under the classification: old gas, composed of all gas covered by NGPA Sections 104 (old interstate) and 106 (rollover contracts). Old gas is in general the lowest priced grouping. New gas, composed of all gas covered by NGPA Sections 102 (new gas), 103 (gas from new onshore production wells), 108 (stripper well gas), and 109 (certain other supplies). High-cost gas, composed of all gas covered by NGPA Section 107. The majority of these purchases are not subject to price control, and are priced at levels substantially above those that apply to other groupings. Miscellaneous, composed of small volumes of gas classified as interstate or covered by NGPA Sections 311 and 312. Total projected purchase volumes increased slightly (2%) between mid-1981 and mid-1982, accompanied by a more significant increase (17%) in the average of projected wellhead prices. Most of the increase in average prices was due to a shift of purchases away from the old gas to the more expensive categories, rather than to major price increases with individual gas categories.

19759 **(ORAU/IEA—83-1(M)) Analysis of industrial demand for natural gas.** Reister, D.B. (Oak Ridge Associated Universities, Inc., TN (USA)). Jan 1983. Contract AC05-76OR00033. 24p. NTIS, PC A02/MF A01. Order Number DE83008212.

Several analysts have proposed the theory that there is a frustrated demand for natural gas in the United States. According to this theory, the natural gas curtailments of the 1970s have convinced industrial users that natural gas is not reliable. The users are willing to but fuel oil at a premium and store it to assure a reliable energy supply. If this theory is correct, as the supply of natural gas becomes more reliable, natural gas should be able to recapture the market share it lost to fuel oil. To investigate this theory, a state-level data base on demand for fuel oil and natural gas by all manufacturing sectors for 1971 and 1974 to 1979 was developed. Then a model was developed to explain manufacturers' demand for fuel oil and natural gas during this period on the basis of fuel price and the availability of natural gas. Rather than a frustrated demand for natural gas, we find an excess demand for natural gas in several states.

Fuel oil may be able to capture the market from natural gas in these states.

19760 **(PB—82-227604) Pacific northwest industrial energy load analysis. Final report May 81-Feb 82.** Minton, G.R.; Schuldt, M.; Taussig, R.T. (Mathematical Sciences Northwest, Inc., Bellevue, WA (USA)). Feb 1982. 149p. (MSNW—82-3114). NTIS, PC A07/MF A01.

A study was carried out by Mathematical Sciences Northwest, Inc. (MSNW) to define research and development of technologies that will enhance the use of natural gas by Pacific Northwest industries. Both technological and economic/institutional factors were considered. The industries included food products; lumber and wood products; paper and allied products; chemicals and allied products; stone, glass and clay products; and primary metals. A variety of technologies were identified which showed promise either of increasing the efficiency of gas use or of adding new industrial uses for natural gas in the Pacific Northwest.

19761 **(FOA-C—40141-C1) Formation and spreading of explosive and toxic gas clouds. A study of the literature.** Nyren, K.; Winter, S.; Hertzberg, O.; Karlsson, E. (Research Inst. of National Defence, Umea (Sweden)). Oct 1981. 98p. (In several languages). NTIS, PC A05/MF A01.

The outflow and aerosol formation at a leakage of pressurized condensed gas, gravity dispersion and the influence of the terrain on heavy gas, are emphasized. It is shown that gas escape, aerosol formation and dispersion of heavy gas on a plane surface are treated considerably more in international literature than the influence of the terrain on the behavior of a heavy gas. Models for calculating discharge and dispersion of heavy gas exist in several countries. Those models demand considerable background knowledge to be applied and recommendations are given how to plan the model work.

19762 **(PB—82-227646) Boiling and spreading rates of instantanteous spills of liquid methane on water. Final report Sep 80-Aug 81.** Chatlos, D.J.; Reid, R.C. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Chemical Engineering). Apr 1982. 111p. NTIS, PC A06/MF A01.

Boiling and spreading rates of liquefied methane were measured in experiments where the cryogen was spilled on ambient water. Spills were essentially instantaneous, and the apparatus was one-dimensional in character. Boiling rates were initially high but decreased rapidly in a manner approximately inversely proportional to the square root of time. Asymptotic heat fluxes were near 25 kW/sq m. Ice formed quickly after the liquid methane contacted the water. Spreading rates were less than would have been expected if no boiling occurred. Analytical models were developed to correlate the spreading and boiling data.

0309 Artificial Stimulation

REFER ALSO TO CITATION(S) 19768, 19769

19763 **(DOE/MC/08216—1352) Evaluation of EL836 explosive stimulation of Devonian gas shale.** Barbour, T.G. (Science Applications, Inc., Fort Collins, CO (USA)). Jul 1980. Contract AM21-78MC08216. 65p. NTIS, PC A04/MF A01. Order Number DE83007141.

This report presents an evaluation of EL836, an explosive developed at E.I. duPont de Nemours and Company Laboratories, in stimulating gas shale. EL836 is a water gel type explosive with a high aluminum content. The computational evaluation of EL836 involved four one-dimensional cyclindrical geometry calculations to assess the influence of two equation-of-state descriptios of EL836, the effect or rock yielding and the effect of internal crack pressurization. Results of a computational evaluation of the EL836 explosive in stimulating Devonian gas shale suggest the following: Extensive plastic yielding will occur in a region immediate to the borehole. Extensive tensile fracture will occur in a region that begins at the outer boundary of plastic deformation and terminates at more than 100 borehole radii. Without a mechanism of ;near-wellbore fracture, such as crushing or pre-cracking during drilling or intentional borehole grooving, the plastic flow that occurs adjacent to the wellbore causes stress redistributions which prohibit early-time (less than a millisecond) tensile fracture immediate to the wellbore and thus prohibits gas penetration from the wellbore into the crack system. The barrier that the near-wellbore plastic zone presents to gas flow from the wellbore is reduced in radial dimension as time increases. Natural fractures in the wellbore wall or cataclysmic deformation and fracture adjacent to the wellbore, as a result of the explosive detonation, will likely assist in breaking down the barrier to gas flow. Very significatn enhancement is achieved in the EL836 stimulation treatment when gases penetrate the stress-wave induced radial cracks. Only minor differences were observed in the EL836 stimulation effects when comparison is made between two different explosive equations-of-state. 33 figures, 2 tables.

19764 **(DOE/MC/16015—1368-Vol.1) Chip desorption and pore-structure effects in methane release from coal. Final report.** Williams, F.L. (New Mexico Univ., Albuquerque (USA). Dept. of Chemical and Nuclear Engineering). Jan 1983. Contract AC21-81MC16015. 56p. NTIS, PC A04/MF A01. Order Number DE83007255.

Engineering aspects of methane release from coal have been studied in order to define the mechanisms which are operative during the delineation of methane by the chip desorption technique and during gas generation prior to crack flow into a production well. In addition, characterization of the surface area and pore structure of the test coal (Fruitland coal, San Juan Basin) revealed a basic understanding of methane storage mechanisms and resource delination strategies. This report consists of a summary of the task required accomplishments and copies of the other written material as appendices. As a result of our work, we have been able to conclude that: the chip desorption technique and associated lost-gas correction factors are valid coalbed methane delineation techniques; basin wide coalbed methane delineation is very site specific and seems to defy normal trend expectations; coalbed methane content appears to be geologically influenced much more strongly than limited by equilibrium adsorption capacity; diffusion of methane through coal should be described by a two parameter model which properly gives gas evolution rates over both short and long times; surface properties of coal as measured at low pressures do not seem to relate to the high pressure measurements of the methane adsorption capacity. As a result of this study, and the considerable field work associated with it, the DOE has promulgated a delineation technique and stimulated commercial activity in the San Juan Basin of northern New Mexico and southern Colorado. Recommendations for further work call for studies related to the completion and production strategies for particular basins. 17 figures, 8 tables.

19765 **(NMERDI—2-69-3304) Large-scale stimulation of a low-permeability Permian Pennsylvanian, gas reservoir.** Martin, F.D.; Stall, R. (New Mexico Inst. of Mining and Technology, Socorro (USA). New Mexico Petroleum Recovery Research Center). Jan 1983. 11p. New Mexico Energy Research and Development Institute, Information Center, 117 Richmond Drive, N.E., Albuquerque, NM 87106.

This project was a cooperative program with Yates Petroleum Corp. of Artesia, NM. The purpose of the project was to improve gas production from an existing well in the low-permeability Permian Pennsylvanian carbonate reservoir. After reviewing engineering and production data from 23 wells in the 50 sq-mile area investigated, the Griffin J.J. No. 1 was selected by Yates as being representative of most of the wells producing from this reservoir. Prior to the large-scale stimulation treatment, pressure buildup tests were conducted and analyzed. From this testing, the formation flow capacity was estimated to be 2.6 md-ft, the permeability was calculated to be 0.09 md, and a negative skin factor of about 4.0 was indicated. The very low skin effect suggested that a successful stimulation treatment must penetrate far away from the wellbore and intersect pockets of gas that were not flowing through the low-permeability flow paths. Proposed treatment programs were obtained from three different service companies. The program employed was a massive hydraulic fracture treatment that included 224,000 lbs. of 20 to 40 mesh sand, 140,000 gallons of gelled 2% KCL water, and 70,000 gallons of liquid CO_2. On September 22, 1981, this treatment was pumped into the Griffin well at an average treating pressure of 9000 psi. After some early production problems, the gas production two months after the treatment was approximately twice the pre-stimulation level. Four months after the stimulation, gas production was almost three times the rate prior to the treatment; to date, this increased production has been sustained for six months. Based on the observed increase in gas production, the massive fracture treatment was economically successful.

19766 **(PB—82-217654) Study on the propagation of hydraulic fractures in rocks (etude sur la propagation des fractures hydrauliques dans les roches). Final report.** Cornet, F.H. (Commission of the European Communities, Luxembourg). [nd]. 69p. (EUR—7287-FR). NTIS PC E04/MF E04.

The possibility of forming multiple hydraulic links between two deep wells by means of hydraulic fracturing was investigated. Isotropic rocks and those whose fracture behavior is anisotropic were considered. A mathematical model showed that for isotropic rocks, the fractures should align progressively parallel to the direction of the maximum principal stress in relation to the well where they originated.

19767 **(SAND—82-0282C) In-situ stress variations and hydraulic-fracture containment in layered rock: observations from a mineback experiment.** Teufel, L.W.; Warpinski, N.R. (Sandia National Labs., Albuquerque, NM (USA)). 1983. Contract AC04-76DP00789. 4p. (CONF-830401—1). NTIS, PC A02/MF A01. Order Number DE82010080.

From 5. ISRM congress; Melbourne, Australia (10 Apr 1983).

The purpose of this paper is to summarize the results of realistic in-situ experiments which have been conducted in an existing tunnel complex at the US Department of Energy's Nevada Test Site to examine hydraulic fracture propagation in layered rock under many different conditions. These facilities are ideal for hydraulic fracture experiments because they provide a realistic in-situ medium with the appropriate boundary conditions (in-situ stresses, with no face surfaces) yet still allow for detailed examination of the induced fractures and geological features through mineback. Although the experiments are conducted in layered, volcanic-tuffs and not sandstones and shales usually encountered in gas reservoirs, proper application of rock mechanics principles allows the extrapolation of these results to gas reservoir conditions. Small scale hydraulic fraxctures were created at various stratigraphic horizons in inclined, sub-horizontal boreholes drilled from an existing tunnel using dyed-water fracture fluid (0.6 m^3) injected at low rates (0.05 m^3/minute). The results of these experiments show that determination of the in situ stresses in a reservoir stratigraphic sequence is important for proper design of massive hydraulic fracture treatments, particularly for determining the height of the fracture. This would provide an estimate of whether stress magnitudes in the reservoir rock and bounding layers would result in containment of the fracture or enhance out-of-zone propagation and failure of the treatment. The magnitude of the required compressional stress difference in the bounding layers may depend on a number of factors, including the size of the fracture, fracture pressure, and fluid leakoff. These parameters will be evaluated in larger fracture experiments.

0330 Properties

19768 **(DOE/MC/08216—1330) Material properties of Devonian shale for stimulation-technology development.** Blanton, T.L.; Young, C.; Patti, N.C. (Science Applications, Inc., Steamboat Springs, CO (USA)). Oct 1980. Contract AM21-78MC08216. 47p. NTIS, PC A03/MF A01. Order Number DE83006484.

Material properties are used in the design of hydraulic fracturing treatments to establish a relation between the volume of fluid used in a job and the expected extent of the fracture. In Devonian shales this is important in determining the volume of fluid necessary to intersect the natural fracture system. In an attempt to provide a consistent and self-contained data base on the physical properties of Devonian shale, Science Applications has reviewed and collected previously generated data from numerous sources and has performed additional experiments so as to define the applicability of some of the quasi-static data to the evaluation of dynamic treatments. The review, experiments and evaluation which have been conducted on Devonian shale physical properties have resulted in the following principle conclusions: the elastic properties and yield surfaces defined by triaxial tests on Devonian shale may be significantly dependent upon shale type and organic richness, but a more systematic approach to core selection and testing will be required to establish correlations. Sufficient material property data for modeling and stimulation design exist only on a very site-specific basis, and more testing is required for identifying generic and regional trends. Dynamic experiments employing modified split-Hopkinson-bar techniques were so controlled by anisotropic sample failure that quantitative data on dynamic yield strength could not be obtained. There is a strong need for the development of experimental techniques and the generation of concordant data on the dynamic yield characteristics of Devonian shale at strain rates representative of explosive and tailored-pulse-loading. 9 figures, 17 tables.

19769 **(DOE/MC/08216—1332) Mechanical properties of Devonian shales from the Appalachian Basin.** Blanton, T.L.; Dischler; Patti, N.C. (Science Applications, Inc., Steamboat Springs, CO (USA)). 30 Sep 1981. Contract AM21-78MC08216. 174p. NTIS, PC A08/MF A01. Order Number DE83006477.

A prime objective of the current study has been to establish wherever possible regional or stratigraphic trends in the various properties required by stimulation research. Lithologically Devonian shales tend to fall into two categories: gray shales and organic-rich black shales. Two black/gray pairs, Huron/Hanover and Marcellus/Mahantango, were selected from four localities in Pennsylvania and Ohio for comprehensive testing. Over 130 experiments were run on these zones to determine elasticity, fracture properties, yield and ultimate strength, and ductility. The results of these tests and previous tests run on core from West Virginia and Kentucky provide a basis for the following conclusions about Devonian shale mechanical properties and their applications in stimulation research: elasticity of Devonian shale matrix material showed no strong trends with respect to either lithology, locality, or confining pressure. Gray shales tended to have a slightly higher Young's modulus than black shales, but the difference between the averages was less than the standard deviation of each average. Ultimate strength, yield strength, and ductility all increase with increasing confining pressure, which is typical for most rocks. Ultimate strength and yield strength tend to be higher for gray shales, whereas black shales tend to be more ductile. Tensile strength showed no particular trends either regionally or lithologically, whereas fracture energy seemed to have the most consistent trends of any material property measured. Black shales tended to have a higher fracture energy, and fracture energy for both black and gray shales tended to increase with depth of burial. Two promising topics for continued study are the effect of confining pressure on fracture energy and the effect of deformation rate on material properties. 16 figures, 9 tables.

19770 **(NBS-MONO—169) Thermophysical properties of normal butane from 135 to 700 K at pressures to 70 MPa.** Haynes, W.M.; Goodwin, R.D. (National Bureau of Standards, Boulder, CO (USA)). Apr 1982. 199p. GPO.

Using a modified version of the nonanalytic equation of state, thermophysical properties of normal butane are derived from physical properties data and are tabulated at integral temperatures from 135 to 700 K along isobars at pressures to 70 MPa. These isobar tables, along with a table for the saturated liquid, give values for densities, compressibility factors, internal energies, enthalpies, entropies, heat capacities, fugacities, sound velocities, dielectric constants, and isochore and isotherm derivatives. Equations, whose coefficients are determined from a least squares fit to selected experimental data, are also presented for vapor pressures, orthobaric liquid and vapor densities, ideal gas properties, second virial coefficients, dielectric constants, heats of vaporization, melting pressures, and orthobaric liquid specific heats, enthalpies, and entropies. Comparisons between experimental and calculated values for all properties considered here are reported in detail.

19771 **(NBS-MONO—170) Thermophysical properties of propane from 85 to 700°K at pressures to 70 MPa.** Goodwin, R.D.; Haynes, W.M. (National Bureau of Standards, Boulder, CO (USA). Thermophysical Properties Div.). Apr 1982. 252p. National Bureau of Standards, Washington, DC.

Thermophysical properties of propane are tabulated at integral temperatures over the entire range of fluid states from 85 to 700°K along isobars to 70 MPa by using a modified form of the nonanalytic equation of state. These tables, along with a table for the saturated liquid, include values for density, compressibility factor, internal energy, enthalpy, entropy, heat capacities, fugacity, sound velocity, dielectric constant, and isochore and isotherm derivatives. In addition to the equation of state, equations are presented for vapor pressures, orthobaric vapor and liquid densities, ideal gas properties, virial coefficients, dielectric constants, heats of vaporization, melting C, and orthobaric liquid specific heats, enthalpies, and entropies. Coefficients were determined by a least squares fit of selected experimental data, including several new sets of data not included in previous propane correlations. Comparisons between experimental and calculated values are given, including those for sound velocities, heat capacities, P-rho-T data, etc.

19772 **(PB—82-227679) Liquid-vapor equilibria for ternary natural gas systems. Annual report Sep 80-Sep 81.** Kidnay, A.J.; Sloan, E.D. (Colorado School of Mines, Golden (USA)). Sep 1981. 61p. NTIS, PC A04/MF A01.

Vapor liquid equilibrium (VLE) data were measured for the nitrogen + carbon dioxide binary system at 220 and 240K and for the methane + carbon dioxide system at 219.26, 240 and 270K. Ternary VLE measurements were made for the system N2 + CH4 + CO2 at 220K and 6.080, 9.119 and 12.159 MPa, 233.15K at 8.106 MPa, and 240K at 7.093, 9.119 and 12.159 MPa. The multifluid reference corresponding states method proposed by Teja and Rice was applied to VLE calculations and the results of this method for the binary and ternary systems were compared with the results of this method for the binary and ternary systems were compared with the results of the Lee-Kesler corresponding states correlation and the Peng-Robinson equation of state.

19773 **(AD-A—120047/6) Application of CARS to obtain temperature in flame environments. Final report.** Vanderhoff, J.A.; Kotlar, A.J. (Army Armament Research and Development Command, Aberdeen Proving Ground, MD (USA). Ballistics Research Lab.). Aug 1982. 49p. (ARBRL-TR—02417). NTIS, PC A03/MF A01.

A coherent anti-Stokes Raman scattering (CARS) experiment has been assembled and used to determine temperatures in various flame experiments. Using the Q-branch rotational-vibrational CARS signal from the N_2 molecule, temperature profiles in CH_4/air and CH_4/NeO premixed flames have been obtained. Additionally temperatures have been determined for H_2 and CH_4 diffusion flames using the CARS signal from the Q-branch of H_2. Several possible experiments in ballistics (muzzle flash and propellant strand burning) are discussed in the report.

19774 **(PB—83-114173) Equipping a shaft and mining bulk samples of oil shale, nahcolite and dawsonite. Report for Jan 78-Apr 81.** Amstutz, R.W. (Williams Bros. Engineering Co., Tulsa, OK (USA)). Apr 1981. 81p. NTIS, PC A05/MF A01.

A 5-year program was planned for environmental research and geotechnical test work at the Oil Shale Mining Environmental Research Facility in the central Piceance Creek Basin, Rio Blanco County, Colo. The facility consisted of a small-diameter lined shaft that would be equipped with a head frame, a hoist, and a surface plant to provide access to the deep, thick deposits of oil shale and the associated saline minerals including nahcolite and dawsonite. The objective of the research was to determine the potential effects of oil shale extraction upon the natural environment and the living and working environment, and to develop the technology required to resolve or mitigate the adverse effects. This report describes the equipping of the shaft and the mining of bulk samples of oil shale, nahcolite, and dawsonite from two levels.

19775 **(USBM-OFR—153(1)-82) Bureau of Mines oil-shale data bank. Part I. Bibliography. Volume 1.** Thill, R.E.; West, D.N.; Radcliffe, K.S.; Peterson, O.M. (Bureau of Mines, Washington, DC (USA)). 1981. 563p. Bureau of Mines, Washington, DC.

The data bank (OSDB) was created in 1976 to serve as a centralized source for the storage, retrieval, and dissemination of technical literature, patents, and information on research projects in oil shale. Thousands of bibliographic references, patents, and research projects relating to the mining of oil shale have been identified, abstracted, and indexed according to selected keyword topics. The bibliograhic section is arranged alphabetically by author and contains references and abstracts of literature pertaining to resource definition and the mining and processing of oil shale.

19779 (LA—9614-PR) Explosively produced fracture of oil shale. Progress report, July-September 1982. (Los Alamos National Lab., NM (USA)). Feb 1983. Contract W-7405-ENG-36. 19p. NTIS, PC A02/MF A01. Order Number DE83008357.

The Los Alamos National Laboratory is conducting rock fragmentation research in oil shale to develop the blasting and fluid-flow technologies required to prepare a rubble bed for a modified in situ retort. The first section of this report summarizes the rock fragmentation program completed with the cooperation of the Oil Shale Consortium and Science Applications, Inc.; it also details the plans for a joint DOE/Sandia National Laboratories/Los Alamos program based on the results of the Consortium program. In addition, Sec. I describes the explosive engineering tests conducted to evaluate dead-pressing characteristics and to verify the reversal-plane fracture capabilities of the ANFO slurry explosive used in the Consortium program. The second section presents a paper on computer modeling and theory that relates the permeability of fractured rock to percolation theory and statistical crack mechanics.

19780 (N—8228697) The effects of lease size on yields from oil shale surface mines. Pei, R.Y.; Rubenson, D.S. (RAND Corp., Santa Monica, CA (USA)). Mar 1982. 36p. (RAND/N—1798-DOE). NTIS, PC A03/MF A01.

The effects of lease size and waste disposal policy on the amount of oil shale that can be recovered from an open pit mine are examined. Process facilities and waste disposal are considered, and the effects of federal leasing policy on the long-term potential of oil shale are assessed. Geometrical analysis of an open pit mine provided an understanding of the relation between lease size and resource recovery. The amount of recoverable oil shale was found to be limited to no more than 20 percent of the resource in place.

19781 (N—8228789) Steam reforming of n-hexane on pellet and monolithic catalyst beds. A comparative study on improvements due to heat transfer. (Jet Propulsion Lab., Pasadena, CA (USA)). Oct 1981. 46p. NTIS, PC A07/MF A01.

Monolithic catalysts with higher available active surface areas and better thermal conductivity than conventional pellets beds, making possible the steam reforming of fuels heavier than naphtha, were examined. Performance comparisons were made between conventional pellet beds and honeycomb monolith catalysts using n-hexane as the fuel. Metal-supported monoliths were examined. These offer higher structural stability and higher thermal conductivity than ceramic supports. Data from two metal monoliths of different nickel catalyst loadings were compared to pellets under the same operating conditions. Improved heat transfer and better conversion efficiencies were obtained with the monolith having higher catalyst loading. Surface-gas interaction was observed throughout the length of the monoliths.

19782 (NMERDI—2-69-3410) Pilot study on the isolation, metabolism and adaptation of microorganisms to Santa Rosa tar sand hydrocarbons. Phase II. Final report, June 17, 1982-July 17, 1982. Sanchez, G. (Eastern New Mexico Univ., Portales (USA). Dept. of Biology). Jan 1983. 17p. New Mexico Energy Research and Development Inst., 117 Richmond Dr., NE, Albuquerque, NM 87106.

This report describes and discusses additional work on a project which involved the use of microorganisms for increasing extraction efficiencies on tar sands. The study was conducted primarily on samples from the Santa Rosa Tar Sands (Guadalupe County, New Mexico). However, in order to be able to fully evaluate the results, parallel comparative studies were conducted on tar sand samples from an Alabama formation. A species of bacteria, Bacillus brevis, which had previously been isolated and adapted for growth on tar sands hydrocarbons was used. The results of the study indicate that bacterial action enhances the solvent extractability of crude from the tar sands. it was also found that sulfur and nitrogen contents of, especially, Santa Rosa tar sands are significantly reduced. Although the work is considered to be fairly conclusive it is suggested that further work and refinement is required. It is believed that the microbial process has merit but that the extraction efficiency can be improved by further work or perhaps the development of other micoorganisms.

19783 Combined fluidized-bed retort and combustor. Shang, J.Y.; Notestein, J.E.; Mei, J.S.; Zeng, L.W. US Patent Application 6-368,197. 14 Apr 1982. 15p.

The present invention is directed to a combined fluidized bed retorting and combustion system particularly useful for extracting energy values from oil shale. The oil-shale retort and combustor are disposed side-by-side and in registry with one another through passageways in a partition therebetween. The passageways in the partition are submerged below the top of the respective fluid beds to preclude admixing or the product gases from the two chambers. The solid oil shale or bed material is transported through the chambers by inclining or slanting the fluidizing medium distributor so that the solid bed material, when fluidized, moves in the direction of the downward slope of the distributor.

19784 (PB—82-236936) Compendium of synfuel end use testing programs. Final report mar-sep 81. Ghassemi, M.; Quinlivan, S.; Haro, M. (TRW, Inc., Redondo Beach, CA (USA)). May 1982. 237p. NTIS, PC A11/MF A01.

The report gives information on major, recently completed, current, and planned synfuel end-use testing projects. It is intended to promote the flow of information between synfuel testing programs, thereby reducing the duplication of effort and enabling design and implementation of cost-effective and systematic approaches to the collection of appropriate environmental data in conjunction with on-going and planned performance testing projects. EPA plans to update this compendium to include results from current and future testing programs. Projects described in the compendium include testing of shale-derived fuels, SRC-II middle distillates, EDS fuel oils, H-coal liquids, and methanol/indolene mixtures in such equipment as utility boilers, steam generators, diesel engines (laboratory and full scale), auto engines, and other combustors. Published reports on testing and discussions with test sponsors/contractors are the sources of data for the compendium. Agencies/organizations providing input include DOD, DOE, NASA, EPRI, private synfuel developers, and engine manufacturers.

19785 (UCID—19738) Vapor pressure of shale oil and prediction of condenser performance. Bissell, E.R.; Burnham, A.K. (Lawrence Livermore National Lab., CA (USA)). 1 Mar 1983. Contract W-7405-ENG-48. 75p. NTIS, PC A04/MF A01. Order Number DE83008479.

Data are presented for the vapor pressure as a function of temperature for oil generated under Fischer Assay conditions from Anvil Points 24 gpt shale. Similar data are also given for the same oil after varying amounts up to 12% of the more volatile constituents have been distilled off. These data are then applied to estimation of the performance of condensers operated at various temperatures.

19786 Geotomorgraphy in oil shale. Daily, W.D.; Lytle, R.J.; Laine, E.F.; Okada, J.T.; Deadrick, F.J. (University of California, Lawrence Livermore National Laboratory, Livermore, California 94550). *Journal of Geophysical Research;* 87: No. B7, 5507-5516(10 Jul 1982).

Geophysical tomographs were made of oil shale at the Occidental Oil Shale, Inc., mine near DeBeque, Colorado. These tomographs mapped the in situ radio frequency electromagnetic attenuation of oil shale between 1 and 40 MHz in a plane 27 by 12 m. Measured attenuation rates (inverse skin depth) ranged from 0.1 to 0.5 m^{-1} with the attenuation rate approximately proportional to the square root of frequency. At 20 MHz, the measured relative permittivity of oil shale is about 9. Geotomographs were made in another plane 16.8 by 12 m, before and again after the shale in this region was explosively rubbled. Measured electromagnetic attenuation rates at 20 MHz were generally larger in the rubble than in the undisturbed shale suggesting that geotomography may be useful in mapping a characteristic of the rubbled zone such as void content or void size distribution. Model calculations of the rubble using a theory of dielectric mixtures predict a smaller attenuation rate in the rubble, implying that the measurements result from phenomena such as scattering or oil shale anisotropy, which are not accounted for in the model.

19787 (PB—82-249889) Combustion of oil shale in fluidized-bed combustors: an overview. Final report May-Nov 81. Roeck, D.R. (GCA Corp., Bedford, MA (USA). GCA Technology Div.). May 1982. 67p. NTIS, PC A04/MF A01.

The report gives an overview of the combustion of oil shale in fluidized-bed combustors. Oil shale can be combusted directly, or as a supplement to coal fuel, and can function as an SO2 sorbent in atmospheric fluidized-bed combustion (AFBC). Spent shale from retorting processes may provide for SO2 sorption and add some residual fuel value in AFBC. Commercial applications of direct combustion of oil shale in AFBC are limited, and known to exist only in Estonia (Soviet Union), China, and southern Germany. Pilot- and laboratory-scale combustion of shale and coal/shale mixtures in AFBCs in the U.S. has been investigated. A preliminary economic analysis indicates that substituting oil shale for limestone in an AFBC may have significant cost advantages, especially where shale (or spent shale) is readily available and at low cost.

19788 (RAND/N—1798-DOE) Effects of lease size on yields from oil-shale surface mines. Pei, R.Y.; Rubenson, D.S. (RAND Corp., Santa Monica, CA (USA)). Mar 1982. Contract AC01-80PE70271. 36p. NTIS, PC A03/MF A01. Order Number DE83008185.

This note examines the effects of lease size and waste disposal policy on the amount of oil shale that can be recovered from an open pit mine. It also considers process facilities and waste disposal, and assesses the effects of federal leasing policy on the long-term potential of oil shale. The relation between lease size and resource recovery depends on several factors, many of which are sensitive to specific lease conditions. Nonetheless, this study shows that an understanding of that relation can be obtained through geometrical analysis of an open pit mine. Our analysis shows that existing regulations limit the amount of recoverable oil shale to no more than 20% of the resource in place. This result is based on the assumption that oil shale waste products are continuously stored on site, but that they can be moved more than once (multiple handling) to increase resource recovery. If the economic constraints of single handling of wastes are considered, resource yield is limited to approximately 10%. Those low yields are the result of unfavorable area-to-depth ratio for the mines, which leaves large deposits of shale beneath the mine walls. Increasing lease size, and thus increasing the area-to-depth ratio, results in a higher yield. Significantly larger yields can be obtained by allowing larger leases or by maintaining existing lease size and allowing off-site disposal of wastes. Our analysis shows, however, that the need for off-site disposal lands is negligible for leases larger than 35,000 acres. Although off-site disposal increases yield for small leases, significant amounts of land are required for waste disposal. The contiguous nature of the Piceance Basin oil shale implies that these lands may contain large quantities of oil shale. Thus, although off-site disposal may be a simple method of improving yield for small leases, it could have an adverse effect on the long-range potential of recovering oil shale.

19789 (GJBX—6(83)) Assessment of uranium potential for the NURE quadrangle evaluation program: the elicitation procedure. National Uranium Resource Evaluation. Mathews, G.W.; Marshall, S.F.; McClain, L.K. (Bendix Field Engineering Corp., Grand Junction, CO (USA)). Feb 1983. Contract AC13-76GJ01664. 24p. NTIS, PC A02/MF A01. Order Number DE83007328.

The Data Integration Group (DIG), Bendix Field Engineering Corporation, Grand Junction Operations, devised a method of integrating the results of National Uranium Resource Evaluation (NURE) quadrangle evaluation with the assessment of potential uranium resources. The procedure requires an interactive meeting of the quadrangle principal investigator(s), US Department of Energy (DOE) regional geologists, and DIG personnel. This meeting consists of two parts: a technical discussion, designed to ensure proper application of recognition criteria in the definition of favorable environments; and an elicitation of endowment-estimating variables. A standardized format for eliciting subjective probability estimates of volume and grade factors from the principal investigator(s) of each quadrangle encourages unbiased estimates and ensures adequate tracking of the geologic rationale used in making the estimates. 5 figures. 1 table.

19790 **(GJBX—11(83)) Computer-modeling codes to improve exploration nuclear-logging methods. National Uranium Resource Evaluation.** Wilson, R.D.; Price, R.K.; Kosanke, K.L. (Bendix Field Engineering Corp., Grand Junction, CO (USA)). Mar 1983. Contract AC13-76GJ01664. 17p. NTIS, PC A02/MF A01. Order Number DE83008322.

As part of the Department of Energy's National Uranium Resource Evaluation (NURE) project's Technology Development effort, a number of computer codes and accompanying data bases were assembled for use in modeling responses of nuclear borehole logging Sondes. The logging methods include fission neutron, active and passive gamma-ray, and gamma-gamma. These CDC-compatible computer codes and data bases are available on magnetic tape from the DOE Technical Library at its Grand Junction Area Office. Some of the computer codes are standard radiation-transport programs that have been available to the radiation shielding community for several years. Other codes were specifically written to model the response of borehole radiation detectors or are specialized borehole modeling versions of existing Monte Carlo transport programs. Results from several radiation modeling studies are available as two large data bases (neutron and gamma-ray). These data bases are accompanied by appropriate processing programs that permit the user to model a wide range of borehole and formation-parameter combinations for fission-neutron, neutron-, activation and gamma-gamma logs. The first part of this report consists of a brief abstract for each code or data base. The abstract gives the code name and title, short description, auxiliary requirements, typical running time (CDC 6600), and a list of references. The next section gives format specifications and/or directory for the tapes. The final section of the report presents listings for programs used to convert data bases between machine floating-point and EBCDIC.

19791 **(GJBX—14(83)) Application of NURE data to the study of crystalline rocks in the Wyoming uranium province.** Rush, S.M.; Anderson, J.R.; Bennett, J.E. (Bendix Field Engineering Corp., Grand Junction, CO (USA). Grand Junction Operations). Mar 1983. Contract AC13-76GJ01664. 138p. NTIS, PC A07/MF A01. Order Number DE83008323.

The Wyoming uranium province study is a part of the National Uranium Resource Evaluation (NURE) program conducted by Bendix Field Engineering Corporation for the US Department of Energy. The ultimate objective of the entire project is the integration of NURE and other data sources to develop a model for a uranium province centered in Wyoming. This paper presents results of the first phase of the Wyoming uranium province study, which comprises characterization of the crystalline rocks of the study area using NURE hydrogeochemical and stream-sediment data, aerial radiometric and magnetic data, and new data generated for zircons from intrusive rocks in the study area. The results of this study indicate that the stream-sediment, aerial radiometric, aerial magnetic, and zircon data are useful in characterization of the crystalline rocks of the uranium province. The methods used in this project can be applied in two ways toward the recognition of a uranium province: (1) to locate major uranium deposits and occurrences, and (2) to generally identify different crystalline rock types, particularly those that could represent significant uranium source rocks. 14 figures, 8 tables.

19792 **(GJBX—379(81)) Uranium hydrogeochemical and stream sediment reconnaissance of the Beaver NTMS quadrangle, Alaska. National Uranium Resource Evaluation.** D'Andrea, R.F. Jr.; Zinkl, R.J.; Shettel, D.L. Jr.; Langfeldt, S.L.; Hardy, L.C.; Hensley, W.K.; Thomas, G.J.; Martell, C.J.; Maassen, L.W. (comps.). (Bendix Field Engineering Corp., Grand Junction, CO (USA); Los Alamos National Lab., NM (USA)). Nov 1981. Contract AC13-76GJ01664. 98p. NTIS, PC A05. Order Number DE82007980.

The report presents results of a Hydrogeochemical and Stream Sediment Reconnaisance (HSSR) of the Ketchikan NTMS quadrangle, Alaska. In addition to this abbreviated data release, more complete data are available to the public in machine-readable form. These machine-readable data, as well as quarterly or semiannual program progress reports containing further information on the HSSR program in general, or on the Los Alamos National Laboratory (LANL) protion of the program in particular, are available from DOE's Technical Library at its Grand Junction Area Office. Presented in this data release are location data, field analyses, and laboratory analyses of several different sample media. For the sake of brevity, many field site observations have not been included in this volume, these data are, however, available on the magnetic tape. Appendices A and B describe the sample media and summarize the analytical results for each medium. The data have been subdivided by one of the Los Alamos National Laboratory sorting programs of Zinkl and others (1981a) into groups of stream-sediment, lake-sediment, stream-water, lake-water, and ground-water samples. For each group which contains a sufficient number of observations, statistical tables, tables of raw data, and 1;1,000,000 scale maps of pertinent elements have been included in this report. Also included are maps showing results of multivariate statistical analyses. Information on the field and analytical procedures used by the Los Alamos National Laboratory during sample collection and analysis may be found in any HSSR data release prepared by the Laboratory and will not be included in this report.

19795 (GJBX—383(81)) **Probabilistic endowment appraisal system based upon the formalization of geologic decisions. National Uranium Resource Evaluation. Final report: demonstration and comparative analysis of estimates and methods.** Harris, D.P.; Carrigan, F.J. (Bendix Field Engineering Corp., Grand Junction, CO (USA); Arizona Univ., Tucson (USA). Dept. of Mining and Geological Engineering). Dec 1980. Contract AC13-76GJ01664. 135p. NTIS, PC A07. Order Number DE82010923.

This report is the culmination of approximately three and one-half years of research on the design and demonstration of a mineral endowment appraisal system which has as its foundation a formalization of geological decisions within a probabilistic framework. Basically, the probabilistic decision structure of a geologist or team of geologists is captured in a system of computer programs which can be used by a geologist for the estimation of the magnitude of uranium endowment by providing information to this system about the states of earth processes and geologic conditions that pertain to that region being evaluated. Research performed under this contract had two main objectives: demonstration of the endowment appraisal system on the San Juan Basin of New Mexico; a comparison of estimates by the appraisal system with estimates made using other methodologies. The scope of this report is restricted to a demonstration of the appraisal system and the comparison of system estimates for aggregates of stratigraphic units with estimates made by other methodologies. Estimates by geographic subdivision (partitions) of formational units are not presented in the report; however, these estimates are provided, along with input data, in Appendix IV of this report. Similarly, documentations of computer programs and instructions for use of the system are presented in Appendix III. Paleogeologic maps and other information related to the implementation of the appraisal system and to its demonstration are provided in Appendix V. The conceptual and theoretical bases for some of the computations that are made by the appraisal system are described in Appendices I and II. The two reports which were submitted as research reports in fulfillment of contract 77-040-E are included as Appendix I and Appendix III-B.

19797 **Isotope separation apparatus and method.** Cotter, T.P. (to Dept. of Energy). US Patent 4,366,379. 28 Dec 1982. Filed date 5 Jun 1978. vp.

PAT-APPL-912783.

The invention relates to a method and apparatus for laser isotope separation by photodeflection. A molecular beam comprising at least two isotopes to be separated intersects, preferable substantially perpendicular to one broad side of the molecular beam, with a laser beam traveling in a first direction. The laser beam is reflected back through the molecular beam, preferably in a second direction essentially opposite to the first direction. The laser beam comprises pi-pulses of a selected wavelength which excite unexcited molecules, or cause stimulated emission of excited molecules of one of the isotopes. Excitation caused by first direction pi-pulses moves molecules of the isotope excited thereby in the first direction. Stimulated emission of excited molecules of the isotope is brought about by returning pi-pulses traveling in the second direction. Stimulated emission moves emitting molecules in a direction opposite to the photon emitted. Because emitted photons travel in the second direction, emitting molecules move in the first direction. Substantial molecular movement is accomplished by a large number of pi-pulse-molecule interactions. A beam corer collects the molecules in the resulting enriched divergent portions of the beam.

19798 **Method for selectively removing fluorine and fluorine-containing contaminants from gaseous UF$_6$.** Jones, R.L.; Otey, M.G.; Perkins, R.W. (to Dept. of Energy). US Patent 4,364,906. 21 Dec 1982. Filed date 24 Nov 1980. vp.

PAT-APPL-209920.

This invention is a method for effecting preferential removal and immobilization of certain gaseous contaminants from gaseous UF$_6$. The \contaminants include fluorine and fluorides which are more reactive with CaCO$_3$ than is UF$_6$. The method comprises contacting the contaminant-carrying UF$_6$ with particulate CaCO$_3$ at a temperature effecting reaction of the contaminant and the CaCO$_3$.

19799 (CONF-8106164—3) **Consistency in thermophysical properties: enthalpy, heat capacity, thermal conductivity and thermal diffusivity of UO$_2$.** Fink, J.K.; Chasanov, M.G.; Leibowitz, L. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 29p. NTIS, PC A03/MF A01. Order Number DE83007926.

From National Bureau of Standards joint conferences: 8. symposium on thermophysical properties; 17. thermal conductivity conference; 8. thermal expansion conference; Gaithersburg, MD, USA (15 Jun 1981).

Equations have been derived for the enthalpy, heat capacity, thermal conductivity, and thermal diffusivity of UO$_2$. In selection of these equations, we considered the traditional criterion of lowest relative standard deviation between experimental data and the function chosen to fit these data as well as consistency between the thermophysical properties. In the latter case, we considered consistency in (1) thermodynamic relations among properties, (2) the choice of physical phenomena on which to base the theoretical formulation of the equations, and (3) the existence and temperature of phase transitions. 6 figures, 3 tables.

19801 (Juel-Conf—43, pp 123-131) **Chemistry of nuclear waste disposal.** Zimmer, E. Nov 1981. (In German). NTIS (US Sales Only), PC A07/MF A01.

From Seminar of the KTG on chemistry and nuclear waste disposal; Juelich, F.R. Germany (5 Nov 1981).

In extractive purification of the low-enriched uranium fuel element (UO_2-particle fuel element with SiC coating) no problems arise in the PUREX-process which have not already been solved when reprocessing LWR-type reactor and breeder fuel elements. Concerning the HTR-type reactor fuel elements containing thorium, there are two process cycles behind the head end; the pure U-235 is reprocessed in the same manner as the low-enriched uranium fuel, and the thorium, which is the bigger fraction, is reprocessed together with U-233 in the same manner as the mixed oxides. Only the CO_2-off gas system, which contains krypton and carbon 14, leads to difficulties in nuclear waste disposal.

19802 (RFP—3311) **Chemical systems engineering progress report, January-December 1981.** Erfurdt, R.J. (Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant). 5 Feb 1983. Contract AC04-76DP03533. 118p. NTIS, PC A06/MF A01. Order Number DE83007465.

Activities in the following areas are reported: instrumentation systems, waste systems, remote engineering, and component development. (DLC)

19803 **Mercuric iodate precipitation from radioiodine-containing off-gas scrubber solution.** Bosuego, G.P.; Partridge, J.A. (to Dept. of Energy). US Patent 4,362,660. 7 Dec 1982. Filed date 14 Jul 1980. vp.

PAT-APPL-168979.

Mercuric nitrate-nitric acid scrub solutions containing radioiodine may be reduced in volume without excessive loss of volatile iodine. The use of concentrated nitric acid during an evaporation process oxidizes the mercury-iodide complex to a less volatile mercuric iodate precipitate.

19804 **Plutonium aerosols size distribution in a reprocessing plant.** Perrin, M.L.; Madelaine, G. pp vp of Aerosols in science, medicine and technology. Stoeber, W.; Hochrainer, D. (eds.). Bad Soden, Germany; Gesellschaft fuer Aerosolforschung e.V. (1981).

From Conference on aerosols in science and technology - aerosols in and from in and from industrial processes; Duisburg, F.R. Germany (23 Sep 1981).

Concern regarding the potential release of radioactive particles in the atmosphere is actually increasing. Because of this interest, a field sampling programm is in progress in the reprocessing plant of LA HAGUE to estimate the atmospheric radioactive contamination by plutonium aerosols. This paper concerns the measurement of size characteristics of plutonium aerosols generated by typical operations of the reprocessing.

19805 **Aerosol generation from Kerosene fires.** Jordan, S.; Lindner, W. pp vp of Aerosols in science, medicine and technology. Stoeber, W.; Hochrainer, D. (eds.). Bad Soden, Germany; Gesellschaft fuer Aerosolforschung e.V. (1981). (In German)

From Conference on aerosols in science and technology - aerosols in and from in and from industrial processes; Duisburg, F.R. Germany (23 Sep 1981).

The course of solvent surface fires is dependent on the surface area on fire; depth of pool and solvent composition do not influence the fire rate. But the fire rate increases rapidly with the burning area. The residual oxygen concentration after a fire in a closed container is dependent on the violence of the fire, i.e. on the burning surface. Moreover the ending of the fire is influenced by the TBP-concentration of the solvent. With sufficient supply of solvent the TBP-concentration changes only slightly during the fire, so that a fire at 14% O_2-concentration is extinguished within the container. With the TBP-concentration changing considerably, i.e. little mass, a fire with a similar burning surface is already extinguished at an O_2-content of 18%. The aerosol generation depends on the fire rate, and so it is higher in free atmosphere than in closed containers. The soot production in the mixture fire (kerosene /TBP 70/30) is higher by a factor 7 than in the pure kerosene fire. Primary soot-particles have a diameter of approximately 0,05 μm and agglomerate rapidly into aggregates of 0,2-0,4 μm.

19806 (DP-tr—38) **Contribution to the study of the behavior of fission-product niobium during the reprocessing of spent nuclear fuel.** Gue, J.P. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.; CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. of Chemistry). 1976. Contract AC09-76SR00001. Translation of CEA-R-4805. 94p. NTIS, PC A05/MF A01. Order Number DE83008151.

The parasitic extraction of certain metals in nitric acid by tributyl phosphate (TBP), or its primary degradation product dibutylphosphoric acid (HDBP), often limits the purification of uranium and plutonium during the reprocessing of spent nuclear fuel. In this study we have attempted to bring some precision to the chemistry of niobium in nitric acid and have specifically investigated its colloidal components and their extraction by TBP and HDBP diluted in dodecane. Using specific methods to study colloidal states, such as ultracentrifugation, zone electrophoresis, coherent light scattering, and electron microscopy, we have examined and described these hydrosols. The first features which became evident throughout this study are: very great polydispersity and poor reproducibility of sols; properties which we usually associate with nicellar colloids, especially in the family of colloidal hydroxides. In the mixture of TBP, HDBP, and dodecane, niobium's general behavior is not fundamentally altered. However, the high value of the distribution coefficient of HDBP in the presence of TBP limits sol coagulation, but increases sol solubility in the organic phase. In this case, the two zones overlap. The behavior of colloidal niobium hydroxide can explain the phenomena generally observed with fission-product niobium in nuclear fuel reprocessing plants. The behavior of niobium in plants can be characterized as follows: instability in fuel-dissolution nitric acid; accumulation, often significant, at TBP extraction interfaces; increased extraction by radiochemical formation of HDBP; and retention in organic phase after reextraction of fissile material (U and Pu). While our study may provide a good account of the behavior of fission-product niobium during the reprocessing of spent nuclear fuel, it does not offer simple solutions to reduce parasitic extraction of this element.

0509 Transport And Storage

19807 (EPRI-NP—2812) **Development and test of methods for the nondestructive assay of spent-fuel assemblies. Final report.** Untermyer, S. II. (National Nuclear Corp., Mountain View, CA (USA)). Jan 1983. 48p. NTIS, PC A03/MF A01. Order Number DE83901588.

Several methods were tested for the non-destructive assay of irradiated nuclear fuel assemblies stored in water-filled pools: burnup measurement by neutron emission; residual fissile measurement by multiplication change with boron displacement; and residual fissile measurement by neutron-source multiplication. It was found that both burnup and residual fissile content could be measured through counting neutron emission from the fuel, both with and without a neutron source. Accuracy of 770 MWD/MTU was attained in burnup determination, while residual fissile content measurements had errors of about 0.1% absolute in fissile content. Still more accurate fissile content measurements appear possible, since the statistical uncertainties in fissile assay (neglecting systematic errors) are estimated to be 0.016% absolute in fissile content. Thus it appears to be practical to assay irradiated fuel assemblies to high accuracy while stored in fuel-storage pools. Further development is recommended, however, to test out the practical limits of precision attainable with this procedure.

19808 (NUREG—0383-Vol.1-Rev.5) Directory of Certificates of Compliance for Radioactive-Materials Packages. Summary report of NRC approved packages. (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Material Safety and Safeguards). Jan 1983. 403p. NTIS, PC A18/MF A01 - GPO $9.50. Order Number DE83901461.

This directory contains a Summary Report of the US Nuclear Regulatory Commission's Approved Packages (Volume I), all Certificates of Compliance (Volume 2), and Summary Report of NRC Approved Quality Assurance Programs (Volume 3) for Radioactive Material Packages effective December 31, 1982. The purpose of this directory is to make available a convenient source of information on packagings which have been approved by the US Nuclear Regulatory Commission. To assist in identifying packaging, an index by Model Number and corresponding Certificate of Compliance Number is included at the back of Volumes 1 and 2 of the directory. A listing by packaging types is included in the back of Volume 2. An alphabetical listing by company name is included in the back of Volume 3 for approved QA programs. The Summary Reports include a listing of all users of each package design and approved QA programs prior to the publication date of the directory.

19811 (NUREG—0725-REV-2) Public information circular for shipments of irradiated reactor fuel. Report for 16 Jul 79-1 May 82. (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Material Safety and Safeguards). Jun 1982. 91p. NTIS, PC A05/MF A01.

This circular has been prepared in response to numerous requests for information regarding routes used for the shipment of irradiated reactor (spent) fuel subject to regulation by the Nuclear Regulatory Commission (NRC), and to meet the requirements of Public Law 96-295. The NRC staff must approve such routes prior to their first use. Spent fuel shipment routes, primarily for road transportation, but also including one rail route, are indicated on reproductions of DOT road maps. Also included are the amounts of material shipped during the approximate three year period that safeguards regulations for spent fuel shipments have been effective. In addition, the Commission provided information in this document regarding the NRC's safety and safeguards regulations for spent fuel shipments as well as safeguards incidents regarding same.

19812 (NUREG—0923) Advance notification of shipments of nuclear waste and spent fuel: guidance. (Nuclear Regulatory Commission, Washington, DC (USA)). Jun 1982. 24p. NTIS, PC A02/MF A01.

U.S. Nuclear Regulatory Commission regulations in 10 CFR 70.5b and 73.37(f) require NRC licensees to notify the governor of a state prior to making a shipment of nuclear waste or spent fuel within or through the state. This guidance document was prepared to assist licensees in carrying out those requirements.

19813 (PNL—4555) Results of simulated abnormal heating events for full-length nuclear fuel rods. Guenther, R.J. (Pacific Northwest Lab., Richland, WA (USA)). Jan 1983. Contract AC06-76RL01830. 43p. NTIS, PC A03/MF A01. Order Number DE83007866.

Full-length nuclear fuel rods were tested in a furnace to simulate the slow heating rates postulated for commercial pressurized water reactor fuel rods exposed to an overheating event in a storage cask. Fuel rod temperatures and internal gas pressures were monitored during the test and are presented along with mensural data for cladding. Metallography of the cladding provided data on grain growth, hydriding, oxidation, cladding stresses, and the general nature of the failures.

19814 (SAND—80-2517) Analysis, scale modeling, and full-scale tests of low-level nuclear-waste-drum response to accident environments. Huerta, M.; Lamoreaux, G.H.; Romesberg, L.E.; Yoshimura, H.R.; Joseph, B.J.; May, R.A. (Sandia National Labs., Albuquerque, NM (USA); Southwest Engineering Associates, El Paso, TX (USA)). Jan 1983. Contract AC04-76DP00789. 70p. NTIS, PC A04/MF A01. Order Number DE83007587.

This report describes extensive full-scale and scale-model testing of 55-gallon drums used for shipping low-level radioactive waste materials. The tests conducted include static crush, single-can impact tests, and side impact tests of eight stacked drums. Static crush forces were measured and crush energies calculated. The tests were performed in full-, quarter-, and eighth-scale with different types of waste materials. The full-scale drums were modeled with standard food product cans. The response of the containers is reported in terms of drum deformations and lid behavior. The results of the scale model tests are correlated to the results of the full-scale drums. Two computer techniques for calculating the response of drum stacks are presented. 83 figures, 9 tables.

19815 Safety assessment of spent fuel transportation in extreme environments. Sandoval, R.P.; Weber, J.P.; Newton, G.J. (Sandia Natl Lab, Albuquerque, NM, USA). *Nuclear and Chemical Waste Management;* 3: No. 1, 5-12(1982).

A preliminary estimate of the health effects and/or consequences resulting from sabotage of spent fuel truck shipments has been made. This estimate is based upon a measured quantity (0.78/plus or minus/0.05 g) of respirable radioactive material released from a 1/4 scale event. A linear extrapolation from the 1/4 scale event to the generic full scale event has been made and an aerosolized release fraction (0.0065%) of the total heavy metal inventory of a three-PWR assembly truck cask has been calculated. It has been shown, based on the preliminary experimental source term data, that a maximum of 25 total latent cancer fatalities could occur, assuming a release in downtown New York City. This is 20 times smaller than the latent cancer fatalities predicted in the so called "Urban Study.

19816 (DOE/AL/10752—19) Review comments on Environmental Analysis Cost Reduction Proposals (WIPP-DOE-136), July 1982. Channell, J.K. (New Mexico Health and Environment Dept., Santa Fe (USA). Environmental Improvement Div.). Nov 1982. Contract AC04-78AL10752. 28p. NTIS, PC A03/MF A01. Order Number DE83007954.

The cost reduction proposals have the laudable goal of significantly reducing the total capital And operating cost connected with WIPP. Furthermore, since the proposed changes would reduce the size and operating rate of the project, they would be expected to have decreased environmental And socioeconomic impacts. However, some of these cost reduction proposals do decrease factors of safety in various components of the project or trade off one type of environmental detriment for another. The report does not contain sufficient detail to justify all of the conclusions reached; more discussion and quantitative information (including costs) is necessary in some cases. Also, there are places where the report is unclear or contradictory. Without a more detailed evaluation, EEG is unable to conclude that each of these cost reduction proposals either has a net environmental/health and safety benefit or a cost savings that justifies a net detriment. A revised Environmental Analysis (EA) should either include additional information or specifically reference backup documents where these conclusions have been justified. In addition, the EA needs to be revised to include the effect of the recently announced (11/18/82) decision by DOE to relocate the underground waste storage areas of the repository to the south.

19817 (AD-A—115953/2) Grout formulations for nuclear waste isolation. Final report. Buck, A.D.; Mather, K. (Army Engineer Waterways Experiment Station, Vicksburg, MS (USA). Structures Lab.). Jun 1982. 35p. NTIS, PC A03/MF A01.

Some of the considerations involved in the development of hydraulic cement-based grout mixtures intended for use in the isolation of nuclear waste stored underground are longevity, impermeability, uniformity, ease of placement, and relevance to previously used systems. Work done at the Structures Laboratory of the U.S. Army Engineer Waterways Experiment Station on this subject has indicated that apparently adequate systems can be based on well known ingredients. Information on field testing and long-term testing of these grouts has confirmed this indication. The following conclusions are indicated: (a) Selection of control parameters such as flow time, time of setting, compressive strength, and permeability for a candidate grout mixture should be criteria used in the formulation of a grout mixture. (b) Once quantitative levels of such parameters have been established, the hydraulic cement-based grout system has adequate latitude in its formulation to accommodate these needs. (c) While longevity in nonaggressive environments and compatibility with host rocks is known in general for such systems, data for specific mixtures under specific conditions must be developed. A Standard Practice for Selecting Mixture Proportions for Hydraulic Cement-Based Materials Systems for Repository Sealing is presented as an Appendix.

19818 (BNL—51614) Waste-Form Development Program. Annual progress report, October 1981-September 1982. Neilson, R.M. Jr.; Colombo, P. (Brookhaven National Lab., Upton, NY (USA)). Sep 1982. Contract AC02-76CH00016. 147p. NTIS, PC A07/MF A01. Order Number DE83008475.

Low-level wastes (LLW) at nuclear facilities have traditionally been solidified using portland cement (with and without additives). Urea-formaldehyde has been used for LLW solidification while bitumen (asphalt) and thermosetting polymers will be applied to domestic wastes in the near future. Operational difficulties have been observed with each of these solidification agents. Such difficulties include incompatibility with waste constitutents inhibiting solidification, premature setting, free standing water and fires. Some specific waste types have proven difficult to solidify with one or more of the contemporary agents. Similar problems are also anticipated for the solidification of new wastes, which are generated using advanced volume reduction technologies, and with the application of additional agents which may be introduced in the near future for the solidification of LLW. In the Waste Form Development program, contemporary solidification agents are being investigated relative to their potential applications to major fuel cycle and non-fuel cycle LLW streams. The range of conditions under which these solidification agents can be satisfactorily applied to specific LLW streams is being determined. These studies are primarily directed towards defining operating parameters for both improved solidification of problem wastes such as ion exchange resins, organic liquids and oils for which prevailing processes, as currently employed, appear to be inadequate, and solidification of new LLW streams including high solids content evaporator concentrates, dry solids, and incinerator ash generated from advanced volume reduction technologies. Solidified waste forms are tested and evaluated to demonstrate compliance with waste form performance and shallow land burial (SLB) acceptance criteria and transportation requirements (both as they currently exist and as they are anticipated to be modified with time).

19819 (CONF-810606—70) Geohydrological considerations in land disposal of LLW. Yeh, G.T.; Tamura, T. (Oak Ridge National Lab., TN (USA)). 1981. Contract W-7405-ENG-26. 29p. NTIS, PC A03/MF A01. Order Number DE81024248.

From American Nuclear Society's annual meeting; Miami Beach, FL, USA (7 Jun 1981).

The geohydrological and geochemical factors that affect the transport, transfer, and transformation of the waste in the aquifer system as a result of shallow land burial practices are discussed. They include surface topography and its character, the extent of the aquifer, nearby surface water bodies, groundwater basin divide, watershed boundaries, rainfall rate, infiltration from surface water bodies, potential evapotranspiration, hydraulic conductivity, water capacity, porosity, compressibility of the matrix, dispersivity, hydrolysis, photolysis, oxidation, volatilization, biolysis, precipitation, mineral comosition, and flow dynamics. Depending on the availability of data and the detail of information desired, three levels of analyses may be undertaken. Two examples are used to illustrate these three levels of analyses using hypothetical parameters. The examples are constructed to represent the leaching from wet water body and shallow burials, respectively. The former typifies a class of problems of groundwater contamination from coal-catching basins and uranium mill tailings. The latter represents classical examples of shallow land burials such as coal solid wastes, chemical dumping and sanitary landfill.

19820 (CONF-811088—7) Incorporation of high-level nuclear waste in gel spheres. Robinson, S.M.; Arnold, W.D.; Bond, W.D.; Angelini, P.; Stinton, D.P. (Oak Ridge National Lab., TN (USA)). 1981. Contract W-7405-ENG-26. 24p. NTIS, PC A02. Order Number DE82022271.

From American Ceramic Society conference; Newport Beach, CA, USA (25 Oct 1981).

Waste sludge is incorporated in gel spheres by the method of internal gelation. Gel spheres containing up to 90 wt % waste have been produced from defense and commercial wastes. A generic cesium-bearing waste form has been developed. Pyrolytic carbon and SiC coatings reduce the leachability of all tested articles to the detection limits.

19821 (DOE/ET/41900—16) **Process description and plant design for preparing ceramic high-level waste forms.** Grantham, L.F.; McKisson, R.L.; Guon, J.; Flintoff, J.F.; McKenzie, D.E. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group). 25 Feb 1983. Contract AC09-79ET41900. 72p. (ESG-DOE—13397). NTIS, PC A04/MF A01. Order Number DE83007885.

The ceramics process flow diagram has been simplified and upgraded to utilize only two major processing steps - fluid-bed calcination and hot isostatic press consolidating. Full-scale fluid-bed calcination has been used at INEL to calcine high-level waste for 18 y; and a second-generation calciner, a fully remotely operated and maintained calciner that meets ALARA guidelines, started calcining high-level waste in 1982. Full-scale hot isostatic consolidation has been used by DOE and commercial enterprises to consolidate radioactive components and to encapsulate spent fuel elements for several years. With further development aimed at process integration and parametric optimization, the operating knowledge of full-scale demonstration of the key process steps should be rapidly adaptable to scale-up of the ceramic process to full plant size. Process flowsheets used to prepare ceramic and glass waste forms from defense and commercial high-level liquid waste are described. Preliminary layouts of process flow diagrams in a high-level processing canyon were prepared and used to estimate the preliminary cost of the plant to fabricate both waste forms. The estimated costs for using both options were compared for total waste management costs of SRP high-level liquid waste. Using our design, for both the ceramic and glass plant, capital and operating costs are essentially the same for both defense and commercial wastes, but total waste management costs are calculated to be significantly less for defense wastes using the ceramic option. It is concluded from this and other studies that the ceramic form may offer important advantages over glass in leach resistance, waste loading, density, and process flexibility. Preliminary economic calculations indicate that ceramics must be considered a leading candidate for the form to immobilize high-level wastes.

19822 (DOE/ET/41900—17) **Commercial high-level-waste management: options and economics. A comparative analysis of the ceramic and glass waste forms.** McKisson, R.L.; Grantham, L.F.; Guon, J.; Recht, H.L. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group). 25 Feb 1983. Contract AC09-79ET41900. 133p. (ESG-DOE—13391). NTIS, PC A07/MF A01. Order Number DE83006235.

Results of an estimate of the waste management costs of the commercial high-level waste from a 3000 metric ton per year reprocessing plant show that the judicious use of the ceramic waste form can save about $2 billion during a 20-year operating campaign relative to the use of the glass waste form. This assumes PWR fuel is processed and the waste is encapsulated in 0.305-m-diam canisters with ultimate emplacement in a BWIP-type horizontal-borehole repository. The estimated total cost (capital and operating) of the management in the ceramic form is $2.0 billion, and that of the glass form is $4.0 billion. Waste loading and waste form density are the driving factors in that the low-waste loading (25%) and relatively low density (3.1 g/cm^3) characteristic of the glass form require several times as many canisters to handle a given waste throughput than is needed for the ceramic waste form whose waste loading capability exceeds 60% and whose waste density is nominally 5.2 g/cm^3) characteristic of the glass form requires several times as many canisters to handle a given waste throughput than is needed for the ceramic waste form whose waste loading capability exceeds 60% and whose waste density is nominally 5.2 g/cm^3. The minimum-cost ceramic waste form has a 60 wt. % waste loading of commercial high-level waste and requires 25 years storage before emplacement in basalt with delayed backfill. Because of the process flexibility allowed by the availability of the high-waste loading of the ceramic form, the intermediate-level liquid waste stream can be mixed with the high-level liquid waste stream and economically processed and emplaced. The cost is greater by $0.3 billion than that of the best high-level liquid waste handling process sequence ($2.3 billion vs $2.0 billion), but this difference is less than the cost of the separate disposal of the intermediate-level liquid waste.

19823 (DOE/ET/41900—18) **Development of polyphase ceramics for the immobilization of high-level Defense nuclear waste.** Morgan, P.E.D.; Harker, A.B.; Clarke, D.R.; Flintoff, J.J.; Shaw, T.M. (Rockwell International Corp., Thousand Oaks, CA (USA). Science Center). 25 Feb 1983. Contract AC09-79ET41900. 108p. (ESG-DOE—13400). NTIS, PC A06/MF A01. Order Number DE83007892.

The report contains two major sections: Section I - An Improved Polyphase Ceramic for High-Level Defense Nucleation Waste reports the work conducted on titanium-silica based ceramics for immobilizing Savannah River Plant waste. Section II - Formulation and Processing of Alumina Based Ceramic Nuclear Waste Forms describes the work conducted on developing a generic alumina and alumina-silica based ceramic waste form capable of immobilizing any nuclear waste with a high aluminum content. Such wastes include the Savannah River Plant wastes, Hanford neutralized purex wastes, and Hanford N-Reactor acid wastes. The design approach and process technology in the two reports demonstrate how the generic high waste loaded ceramic form can be applied to a broad range of nuclear waste compositions. The individual sections are abstracted and indexed separately.

19824 (DOE/ET/41900—18, pp 5-46) **Improved polyphase ceramic form for high-level defense nuclear waste.** Harker, A.B.; Morgan, P.E.D.; Clarke, D.R.; Flintoff, J.J.; Shaw, T.M. 25 Feb 1983. NTIS, PC A06/MF A01.

In Development of polyphase ceramics for the immobilization of high-level Defense nuclear waste.

An improved ceramic nuclear waste form and fabrication process have been developed using simulated Savannah River Plant defense high-level waste compositions. The waste form provides flexibility with respect to processing conditions while exhibiting superior resistance to ground water leaching than other currently proposed forms. The ceramic, consolidated by hot-isostatic pressing at 1040°C and 10,000 psi, is composed of six major phases, nepheline, zirconolite, a murataite-type cubic phase, magnetite-type spinel, a magnetoplumbite solid solution, and perovskite. The waste form provides multiple crystal lattice sites for the waste elements, minimizes amorphous intergranular material, and can accommodate waste loadings in excess of 60 wt %. The fabrication of the ceramic can be accomplished with existing manufacturing technology and eliminates the effects of radionuclide volatilization and off-gas induced corrosion experienced with the molten processes for vitreous form production.

19825 (DOE/ET/41900—18, pp 47-107) **Formulation and processing of alumina based ceramic nuclear waste forms.** Harker, A.B.; Morgan, P.E.D.; Clarke, D.R.; Flintoff, J.J.; Jantzen, C.M. 25 Feb 1983. NTIS, PC A06/MF A01.

In Development of polyphase ceramics for the immobilization of high-level Defense nuclear waste.

A class of dense, high-alumina ceramics has been developed for the immobilization of Savannah River Plant defense nuclear waste. The ceramics, fabricated by hot isostatic pressing or reactive hot pressing, normally consist of four compatible crystalline phases - magnetoplumbite, spinel, uraninite, and corundum. A fifth compatible phase, nepheline, can be designed into the assemblage when high sodium levels are present in the waste. All radionuclides are incorporated into the magnetoplumbite and uraninite phases, with the nonradiophases providing microstructural isolation of the individual radiophase grains. The chemical formulation of the ceramic waste form and the processing requirements is discussed.

19826 (DOE/LLW—16T) **Process for locating shallow land-burial sites for low-level radioactive waste. National Low-Level Radioactive Waste Management program.** (Oak Ridge National Lab., TN (USA); EG and G Idaho, Inc., Idaho Falls (USA)). Mar 1983. Contract AC07-76ID01570. 73p. NTIS, PC A04/MF A01. Order Number DE83008173.

The report describes the development of a screening process for siting low-level radioactive waste disposal facilities, and a test application of that process in Tennessee. The site-selection criteria were developed based on the Nuclear Regulatory Commission's disposal regulation, 10 CFR 61. Data on the geologic, hydrologic, and geographic systems in Tennessee were analyzed to select a suitable area for low-level waste disposal. Selection of the best candidate area was based on: remoteness from population centers, availability of major transportation systems, low risk of flooding, erosion resistance, lack of geologic hazards, and other factors.

19827 **(DOE/NE—0025/1) Uranium Mill Tailings Remedial Action Program. Annual status report.** (USDOE Assistant Secretary for Nuclear Energy, Washington, DC. Office of Terminal Waste Disposal and Remedial Action). Dec 1982. 28p. NTIS, PC A03/MF A01. Order Number DE83008142.

Progress made during FY 1982, present status, and plans for FY 1983 are described for the following programs: radiological surveys and inclusion of vicinity properties; establishment of cooperative agreements; promulgation of standards for remedial action; acquisition of lands and materials; reprocessing of residual radioactive materials; National Environmental Policy Act (NEPA) documentation; program planning; technology development; remedial action; public participation; other federal agency activities; state and Indian tribe activities; and status of designated sites. Program funding is given.

19828 **(DOE/TIC—3388) Waste isolation: a bibliography.** McLaren, L.H. (ed.). (Department of Energy, Oak Ridge, TN (USA). Technical Information Center). Dec 1982. 296p. NTIS, PC A13/MF A01. Order Number DE82012273.

This bibliography contains information on waste isolation included in the Department of Energy's Energy Data Base from January 1981 through November 1982. The abstracts are grouped by subject category as shown in the table of contents. Entries in the subject index also facilitate access by subject, e.g., Radioactive Waste Disposal/Salt Deposits. Within each category the arrangement is by report number for reports, followed by nonreports in reverse chronological order. These citations are to research reports, journal articles, books, patents, theses, and conference papers from worldwide sources. Five indexes, each preceded by a brief description, are provided: Corporate Author, Personal Author, Subject, Contract Number, and Report Number.

19829 **(DPST—78-296) Pathways for dose to man from buried solid waste.** (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 13 Jun 1978. Contract AC09-76SR00001. 26p. NTIS (US Sales Only). Order Number DE83007903.

A conceptual model has been developed to estimate the rate and extent of nuclide transport from buried solid waste through the environment to man and subsequent dose to man. This memorandum describes in detail the pathways of the model. The general form for the transfer coefficient for each pathway is also described.

19830 **(GRS—49) Sensitivity study of the thermomechanical reaction of rock salt to radioactive waste storage.** Mohiuddin, G.M. (Gesellschaft fuer Reaktorsicherheit m.b.H. (GRS), Koeln (Germany, F.R.)). Jul 1982. 34p. (In German). NTIS (US Sales Only), PC A03/MF A01. Order Number DE83750178.

Calculations performed in this study have shown that the STEALTH code is suitable for the prediction of temperature and stress field in a salt dome where radioactive wastes are stored. The STEALTH version used here has been extended by Wahi et al. (Wa et al. 78) and includes the creeping model developed by Maxwell et al. (Ma et al. 78), thus allowing to determine the closure of the caverns too. GRS (Sa, Ba 79) has successfully used this STEALTH version for post-calculations of the temperature field experiment. It has been found that the calculated closure (e.g. the closure of borehole in the temperature field experiment no. 3 in Asse) results almost solely from the creep deformation. As creep deformation depends very much on the temperature and the stress, a better knowledge of the creep mechanism in salt as well as the formulation of a suitable creep law are the prerequisites for a better agreement between calculations and experiments.

19831 **(HEDL-SA—2615) FFTF radioactive solid waste handling and transport.** Thomson, J.D. (Hanford Engineering Development Lab., Richland, WA (USA)). 14 Dec 1981. Contract AC06-76FF02170. 34p. (CONF-820303—43). NTIS, PC A03. Order Number DE82016161.

From Waste management conference; Tucson, AZ, USA (8 Mar 1982).

A description of the solid waste disposal process, and the casks and equipment used for handling and transport is provided.

19832 **(JAERI-M—8824) Radiological safety studies on ground disposal of radioactive wastes. Distribution and migration of radionuclides in the aerated zone.** Takebe, S.; Yamamoto, T.; Wadachi, Y. (Japan Atomic Energy Research Inst., Tokyo. Radioisotope School). Apr 1980. 14p. (MIXED). NTIS (US Sales Only), PC A02/MF A01.

REFS.

The behavior of radionuclides in an aerated zone, and migration and distribution of Cs-137, Co-60 and Sr-90-Y-90 in an aerated sand layer were examined with a medium scale sand layer model apparatus. The distribution ratio of each radionuclide in vertical direction of the sand layer decreases exponentially, going to further depths a large part of radionuclide is adsorbed in the upper region, near to the point of downward flow. Two dimensional distribution of each radionuclide in the sand layer is as follows. Migration of Cs-137 is small in both vertical and horizontal directions of the sand layer. That of Co-60 is large in both vertical and horizontal directions. That of Sr-90-Y-90 is small in horizontal direction and large in vertical direction, and its distribution is similar to the case of Cs-137. In conclusion, the differences in migration and distribution between the radionuclides depend on their chemical forms, i.e., ionic or nonionic.

19833 **(LA-UR—83-307) Measurement of radioactive contaminated wastes.** Caldwell, J.T.; Close, D.A.; Crane, T.W. (Los Alamos National Lab., NM (USA); EG and G, Inc., Goleta, CA (USA)). 1983. Contract W-7405-ENG-36. 13p. (CONF-830205—11). NTIS, PC A02/MF A01. Order Number DE83007541.

From Waste management conference; Tucson, AZ, USA (27 Feb 1983).

At Los Alamos, a comprehensive program is underway for the development of sensitive, practical, nondestructive assay techniques for the quantification of low-level transuranics in bulk solid wastes. The program encompasses a broad range of techniques, including sophisticated active and passive gamma-ray spectroscopy, passive neutron detection systems, pulsed portable neutron generator interrogation systems, and electron accelerator-based techniques. The techniques can be used with either low-level or high-level beta-gamma wastes in either low-density or high-density matrices. The techniques are quite sensitive ($<$ 10 nCi/g detection) and, in many cases, isotopic specific. Waste packages range in size from small cardboard boxes to large metal or wooden crates. Considerable effort is being expended on waste matrix identification to improve assay accuracy.

19834 **(LBL—13600, pp 5-8) Geologic systems as analogs for long-term radioactive waste isolation: intrusive-rock/country-rock contact zones.** Wollenberg, H.; Brookins, D.; Cohen, L.; Flexser, S.; Abashian, M.; Shea, M. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1981.

Selected natural occurrences of minerals and rocks containing radioelements and fission-product elements can be considered as analogs of sites for geologic disposal of nuclear waste. They can be studied to ascertain how radionuclides and their daughter elements might migrate from sites of origin in response to long-term natural processes: heating due to an igneous intrusion; circulation through hydrothermal systems; diffusion through the rock matrix; and weathering and erosion. Initial investigations have covered two quite different potential geologic analogs of nuclear waste isolation: (1) migration around the Bryan-Eldora stock in Colorado; and (2) migration away from the vein deposit of radioactive minerals at Marysvale, Utah. The Eldora and Marysvale studies test the concept of waste disposal in basement rocks under conditions more extreme than those proposed for nuclear waste disposal; both studies strongly suggest the feasibility of storage in basement rocks.

19835 (LBL—13600, pp 8-11) **Iron-nickel alloys as canister material for radioactive waste disposal in underground repositories.** Apps, J.A. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1981.

Canisters containing high-level radioactive waste must retain their integrity in an underground waste repository for at least one thousand years after burial (Nuclear Regulatory Commission, 1981). Since no direct means of verifying canister integrity is plausible over such a long period, indirect methods must be chosen. A persuasive approach is to examine the natural environment and find a suitable material which is thermodynamically compatible with the host rock under the environmental conditions with the host rock under the environmental conditions expected in a waste repository. Several candidates have been proposed, among them being iron-nickel alloys that are known to occur naturally in altered ultramafic rocks. The following review of stability relations among iron-nickel alloys below 350°C is the initial phase of a more detailed evaluation of these alloys as suitable canister materials.

19836 (LBL—13600, pp 11-14) **Coupled hydrologic-thermomechanical experiments for radioactive waste isolation.** Korbin, G.; Wollenberg, H.; Strisower, B.; Wilson, C.; Chan, T. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1981.

Plans for an underground research facility have been formulated, incorporating techniques to assess the hydrologic and thermomechanical response of a rock mass to the introduction and long-term isolation of radioactive waste and to assess the effects of excavation on the hydrologic integrity of a repository and its subsequent backfill, plugging, and sealing. In this report we summarize the conceptual design of the hydrologic-thermomechanical experiment to be conducted in the research facility.

19837 (LBL—13600, pp 15-17) **Thermal impact of waste emplacement and surface cooling associated with geologic disposal of nuclear waste.** Wang, J.S.Y.; Mangold, D.C.; Spencer, R.K.; Tsang, C.F. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1981.

The age of nuclear waste - the length of time between its removal from the reactor cores and its emplacement in a repository - is a significant factor in determining the thermal loading of a repository. The surface cooling period as well as the density and sequence of waste emplacement affects both the near-field repository structure and the far-field geologic environment. To investigate these issues, a comprehensive review was made of the available literature pertaining to thermal effects and thermal properties of mined geologic repositories. This included a careful evaluation of the effects of different surface cooling periods of the wastes, which is important for understanding the optimal thermal loading of a repository. The results led to a clearer understanding of the importance of surface cooling in evaluating the overall thermal effects of a radioactive waste repository. The principal findings from these investigations are summarized in this paper.

19838 (LBL—13600, pp 18-21) **Basis for a tentative thermohydrologic criterion for emplacement density in a nuclear waste repository.** Wang, J.S.Y.; Mangold, D.C.; Tsang, C.F. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1981.

Thermal loading is a principal consideration in the design and evaluation of a repository for geologic disposal of nuclear wastes. Existing criteria are based on thermomechanical stability considerations for the waste package and the repository structural components as well on the allowable surface uplift due to thermal expansion of the surrounding rock medium. The vertical buoyancy flow from the repository to the surface has not been considered as a boundary criterion in the determination of repository loading densities. In this synopsis we discuss a generic thermohydrologic criterion to directly address the issue of thermal impacts on groundwater movement and radionuclide transport.

19839 (LBL—13600, pp 31-34) **Development of a coupled thermal-hydraulic-mechanical finite-element model for saturated fractured porous media.** Noorishad, J.; Wang, J.S.Y.; Tsang, C.F.; Witherspoon, P.A. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1981.

Investigations over the past decade at the University of California, Berkeley, and Lawrence Berkeley Laboratory have led to the development of numerical models capable of analyzing the coupled hydraulic-mechanical behavior of rock masses. Employing the most recent results it is now possible to investigate the coupled hydromechanical response of saturated fractured porous rocks subject to fluid-flow or structural-load boundary conditions. Recent concerns about the safe disposal of radioactive wastes in geologic systems calls for simultaneous consideration of hydromechanical, hydrothermal, and thermomechanical effects in the designs of selected repositories. In view of this fact, and as a natural outgrowth of earlier studies, work has been underway to develop an approach to the thermal-hydraulic-mechanical behavior of fractured rocks. The essential features of this coupled finite-element method are presented in this paper.

19840 (LBL—13600, pp 35-38) **Assessment and evaluation of engineering options at a low-level radioactive waste storage site.** Kanehiro, B.Y.; Guvanasen, V. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1981.

This report summarizes work done at the Weldon Spring radioactive waste storage site. The primary purpose of this work has been to seek solutions to hydrologic and geotechnical problems associated with existing disposal sites and to evaluate the efficiency of engineering options that have been proposed to improve the integrity of such sites. The Weldon Spring site is generally like other low-level nuclear waste sites, except that the wastes are primarily in the form of residues and contaminated rubble from the processing of uranium and thorium ores rather than industrial isotopes or mill tailings.

19841 (LBL—13600, pp 38-41) **Verification and improvement of a predictive model for radionuclide migration.** Miller, C.W.; Benson, L.V.; Carnahan, C.L. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1981.

Prediction of the rates of migration of contaminant chemical species in groundwater flowing through toxic waste repositories is essential to the assessment of a repository's capability of meeting standards for release rates. A large number of chemical transport models, of varying degrees of complexity, have been devised for the purpose of providing this predictive capability. In general, the transport of dissolved chemical species through a water-saturated porous medium is influenced by convection, diffusion/dispersion, sorption, formation of complexes in the aqueous phase, and chemical precipitation. The reliability of predictions made with the models which omit certain of these processes is difficult to assess. A numerical model, CHEMTRN, has been developed to determine which chemical processes govern radionuclide migration. CHEMTRN builds on a model called MCCTM developed previously by Lichtner and Benson.

19842 (LBL—13600, pp 42-44) **Uranium disequilibrium measurements on groundwaters.** Michel, M.C.; Keyes, W.R. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1981.

Among its other uses, the naturally occurring disequilibrium between ^{234}U and ^{238}U in most groundwaters has been suggested as a method of determining the age of such waters. This method is applicable to ages within the range of the half-life of ^{234}U (about 250,000 yr) and is therefore of interest in assessing sites for nuclear waste repositories. As with other suggested methods for groundwater dating, interpretation of the data raises issues that relate to the complexity of the system as well as to our imperfect knowledge of the mechanisms involved in the basic geochemical constraints on the system. It has been the purpose of our work to add to the understanding of the mechanisms by which ^{234}U is enriched or depleted in groundwaters and to develop the necessary analytical techniques for studying these processes. Special emphasis has been given to techniques that will be applicable to likely nuclear waste repository sites - i.e., where water flows are low, rocks are impermeable, and recovery of samples is difficult.

19843 (LBL—13600, pp 45-47) **Uranium (VI) retardaton mechanisms.** Silva, R.J.; Yee, A.W. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1981.

The solubility of hexavalent uranium, UO_2^{2+}, was measured as a function of pH (5 to 10), NaCl supporting electrolyte concentration (0.01 M and 0.1 M NaCl), and equilibration time in batch experiments. Dilute hydrochloric acid solutions of UO_2^{2+} were titrated to the various pH values with NaOH. The solid which precipitated from the supersaturated solution was presumably uranyl hydroxide.

19844 (LBL—13600, pp 48-49) **Sorptive diffusion in clay gels.** Apps, J.A.; Radke, C.J. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1981.

Additional protection for the underground storage of high-level nuclear wastes can be provided by an engineered barrier or backfill material. If properly designed, such a barrier can significantly retard the migration of toxic ions even after failure of the waste canister. The backfill material should be inexpensive, relatively impermeable, thermally stable, highly sorptive to toxic ions, compatible with the host rock, easily applied, and, if possible, a fissure sealant. One material that apparently meets most of these qualifications is a swelling clay known as smectite or montmorillonite. The purpose of this research is to investigate experimentally the migration of representative nuclides in swollen clay gels and to formulate a quantitative transport model allowing reliable design of such an engineered barrier.

19845 (LBL—13600, pp 50-52) **Investigation of silicate surface chemistry and reaction mechanisms associated with mass transport in geologic media.** White, A.F.; Perry, D.L. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1981.

The concentration and rate of transport of radionuclides through geologic media can be strongly influenced by the extent of sorption on aquifer surfaces. Over time intervals relevant to such transport processes, rock and mineral surfaces cannot be considered as inert, unreactive substrates but rather as groundwater/solidphase interfaces which are commonly in a state of natural or artificially induced disequilibrium. The goal of the present research is to define experimentally the type of water/rock interactions that will influence surface chemistry and hence sorption characteristics and capacities of natural aquifers. As wide a range of silicate minerals as possible was selected for study to represent rock-forming minerals in basalt, tuff, and granite. The minerals include K-feldspar, plagioclase feldspar, olivine, hornblende, biotite, and volcanic glass.

19846 (LBL—13600, pp 53-55) **Research on nuclear waste isolation at Stripa: an overview.** Witherspoon, P.A.; Cook, N.G.W.; Gale, J.E.; Wilson, C.R. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1981.

A principal attribute of deep geologic disposal of radioactive waste is the high degree of physical protection it provides against human intrusion and natural events. However, even in a geologically suitable area, transport to the biosphere may occur through groundwater. There are, therefore, a number of attributes that any site should have: low permeability, low interconnected porosity, low hydraulic gradient, and high sorptive capacity. Heat generated by the waste introduces the additional requirements of chemical and mechanical stability. To assess the ability of a rock mass to isolate waste, new experimental techniques and analytical procedures must be developed to improve understanding of rock mass behavior and transport in slowly moving groundwaters. Over the past several years, thermomechanical, hydrological, and geochemical investigations have been conducted by Lawrence Berkeley Laboratory in a fractured quartz monzonite rock at a depth of some 340 m in a worked-out iron ore mine at Stripa in Sweden. This work is part of a Swedish-American cooperative program.

19847 (LBL—13600, pp 56-58) **Radiogeologic assessment for nuclear waste isolation: studies of the Stripa pluton.** Wollenberg, H.; Flexser, S.; Andersson, L. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1980.

To properly characterize candidate sites for radioactive waste isolation, it will be necessary to obtain a good understanding of their radiogeologic settings. The distribution and abundance of the naturally occurring radioelements - ^{238}U, ^{232}Th, their daughters, and ^{40}K, both in the rock mass encompassing the repository and in the neighboring rocks - constitute the baseline upon which the effects of the radioactive waste are superimposed. The distribution of these radioelements is also a good indicator of the geochemical homogeneity of the rock mass. At the Stripa experimental facility in an inactive iron mine in central Sweden, radiogeologic studies included gamma-spectrometric surveys, on the surface and underground, of the U, Th, and K contents of the quartz monzonite pluton encompassing the experiments, the high-grade metamorphic rocks surrounding the pluton, and the neighboring larger granitic plutons. The gamma-spectral surveys were calibrated by laboratory analyses of hand specimens and drill cores, permitting calculation of radioelement concentrations from field counting rates.

19848 (LBL—13600, pp 58-61) **Thermomechanical properties of Stripa granite.** Myer, L. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1980.

The Stripa material properties testing program was initiated to study, by laboratory testing, the thermomechanical behavior of the Stripa rock mass and to provide material properties for input into numerical programs for simulation of the in situ heater experiments at Stripa. The portion of the program dealing with measurement of elastic moduli and coefficients of thermal expansion of dry, intact samples of Stripa granite was completed in fiscal year 1980. A summary of the most significant findings resulting from tests on six samples are presented in this report.

19849 (LBL—13600, pp 61-64) **Analysis of temperature data from the full-scale heater experiments at Stripa.** Javandel, I.; Witherspoon, P.A. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1980.

In order to examine the thermomechanical behavior of deeply fractured crystalline rock when it is used for the isolation of high-level nuclear waste, a series of experiments was conducted in deep granitic rock at Stripa, Sweden, in a site adjacent to an abandoned iron mine. Among these experiments were two full-scale heating experiments carried out at a depth of approximately 340 m. These experiments were designed to study the near-field effects of heating the rock at two different thermal power levels, with electrical heaters substituting for nuclear waste canisters. Later, one of these experiments was supplemented by eight peripheral heaters to account for the interaction of surrounding waste canisters.

19850 (LBL—13600, pp 65-68) **Rod-type extensometers in long-term elevated temperature service.** DuBois, A.O.; Nelson, P.H.; Hood, M.; Binnall, E. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1980.

At Stripa, Sweden, 35 rod-type extensometers were used to measure displacements within the granite rock mass surrounding electrical heaters emplaced in the floor of an underground entry. One of the objectives of these thermomechanical tests was to evaluate the performance of currently available rock instrumentation when subjected to long-term service at elevated temperatures.

19851 (LBL—13600, pp 69-71) **Determination of the state of stress at the Stripa mine, Sweden.** Doe, T. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1980.

The goals of the Stripa stress measurement program are twofold: (1) to provide in situ stress data for the analysis of the thermomechanical and hydrologic measurments at the site and (2) to compare the results of hydraulic fracturing with a variety of overcoring techniques at a common site.

19852 (LBL—13600, pp 163-165) **Chemistry of nuclear waste substances in aqueous solutions.** Phillips, S.L.; Igbene, A. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1981.

Underground storage of nuclear wastes requires prediction of the likelihood of leaching from containers and subsequent migration of waste nuclides into natural waters. Although a great deal of information is needed, this work is limited to thermodynamic and kinetic data on metal-ion species in aqueous media. Such data are used in computer codes, Eh-ph diagrams, and other calculations of metal species at high temperatures.

19853 (LBL—14086) **Nuclear-waste isolation in the unsaturated zone of arid regions.** Wollenberg, H.A.; Wang, J.S.Y.; Korbin, G. (Lawrence Berkeley Lab., CA (USA)). May 1982. Contract AC03-76SF00098. 17p. (CONF-8205157—1). NTIS (US Sales Only). Order Number DE83006956.

From American Geophysical Union spring meeting; Philadelphia, PA, USA (31 May 1982).

The vadose zone in arid regions is considered as a possible environment for geologic isolation of nuclear waste. There are several topographic and lithologic combinations in the vadose zone of arid regions that may lend themselves to waste isolation considerations. In some cases, topographic highs such as mesas and interbasin ranges - comprised of several rock types, may contain essentially dry or partially saturated conditions favorable for isolation. The adjacent basins, especially in the far western and southwestern US, may have no surface or subsurface hydrologic connections with systems ultimately leading to the ocean. Some rock types may have the favorable characteristics of very low permeability and contain appropriate minerals for the strong chemical retardation of radionuclides. Environments exhibiting these hydrologic and geochemical attributes are the areas underlain by tuffaceous rocks, relatively common in the Basin and Range geomorphic province. Adjacent valley areas, where tuffaceous debris makes up a significant component of valley fill alluvium, may also contain thick zones of unsaturated material, and as such also lend themselves to strong consideration as respository environments. This paper summarizes the aspects of nuclear waste isolation in unsaturated regimes in alluvial-filled valleys and tuffaceous rocks of the Basin and Range province.

19854 (LBL—15029) **Selected hydrologic and geochemical issues in site characterization for nuclear waste disposal: flood basalts at the Hanford Reservation.** Carnahan, C.L.; Delany, J.M.; Long, J.C.S.; Silva, R.J.; Watkins, D.J.; White, A.F.; Wilson, C.R. (Lawrence Berkeley Lab., CA (USA)). Sep 1982. Contract AC03-76SF00098. 179p. NTIS, PC A09/MF A01. Order Number DE83007204.

Four issues are considered that must be addressed by a site characterization program designed to evaluate the suitability of the flood basalts of the Pasco Basin in central Washington as a site for the construction of a repository for the disposal of high-level nuclear waste. The four issues are (1) identification of hydrostratigraphic units within a sequence of flood basalts, (2) mechanisms and points of groundwater recharge and discharge, (3) solubility of radionuclides, and (4) phase transformation of fracture filling materials. Each issue is discussed in terms of its significance to waste isolation. Available approaches for resolving the issues are presented and their limitations identified. Where appropriate, research programs for overcoming these limitations are indicated.

19855 (MLM—3045) **Pelletized Waste Form Demonstration Program. Volume II. Description and performance.** Lewis, E.L. (Monsanto Research Corp., Miamisburg, OH (USA). Mound). 28 Feb 1983. Contract AC04-76DP00053. 22p. NTIS, PC A02/MF A01. Order Number DE83008172.

This report (Volume II) presents the design and performance characteristics of the Mound Pelletization Process. Detailed descriptions of both the process and equipment are given as well as the performance characteristics of the Demonstration Waste Pelletization System. Volume I, which was published as a separate document (MLM-MU-82-70-0001), is an engineering reference manual for the Mound Waste Pelletization Process.

19856 (NUREG/CR—2700) **Parameters for characterizing sites for disposal of low-level radioactive waste. Technical report.** Lutton, R.J.; Malone, P.G.; Meade, R.B.; Patrick, D.M. (Army Engineer Waterways Experiment Station, Vicksburg, MS (USA)). May 1982. 77p. NTIS, PC A05/MF A01.

Sixty-seven site parameters and parameter groups are identified as important characteristics of sites for disposal of low-level radioactive waste and require detailed evaluation. Several of the most important parameters are needed for hydrological analysis while others are needed for facility design, construction, and operation. Still others are needed for baseline and detection stages of monitoring. Much of this report, Appendices A through G, is directed to explaining the importances of parameters and to establishing site-specific limitations.

19857 (ONI—3) **Projected costs for mined geologic repositories for dispoal of commercial nuclear wastes.** Waddell, J.D.; Dippold, D.G.; McSweeney, T.I. (Battelle Memorial Inst., Columbus, OH (USA). Office of National Waste Terminal Storage Integration). Dec 1982. Contract AC06-76RL01830. 57p. NTIS, PC A04/MF A01. Order Number DE83004872.

This documen reports cost estimates for: (1) the exploration and development activities preceding the final design of terminal isolation facilities for disposal of commercial high-level waste; and (2) the design, construction, operation, and decommissioning of such facilities. Exploration and evelopment costs also include a separate cost category for related programs such as subseabed research, activities of the Transportation Technology Center, and waste disposal impact mitigation activities.

19858 (ONWI—9(82-3)) **Technical progress report for the quarter, 1 April-30 June 1982.** (Battelle Memorial Inst., Columbus, OH (USA). Office of Nuclear Waste Isolation). 1982. Contract AC06-76RL01830. 202p. NTIS, PC A10/MF A01. Order Number DE83007304.

This report describes the technical accomplishments during the period from April through June 1982 on the commercial nuclear waste management programs under the direction of the Office of Nuclear Waste Isolation (ONWI). This office has lead responsibilities in the National Waste Terminal Storage program structure for oversight and for development of the general technology, and for geologic exploration of non-DOE land. A project management group, ONWI directs and evaluates studies, research, and development performed by subcontractors on repository sites and designs. The scope of ONWI activities includes providing the technology and facilities for the terminal isolation of these wastes by disposal in mined repositories deep underground in stable geologic formations. The ONWI program is organized into eight tasks: Systems; Waste Package; Site; Repository; Regulatory and Institutional; Test Facilities and Excavations; Land Acquisition; and Program Management. The accomplishments in each of these tasks are reported.

19859 (ONWI—102-Vol.1) **Area environmental characterization report of the Dalhart and Palo Duro basins in the Texas Panhandle. Volume I. Dalhart Basin.** (NUS Corp., Gaithersburg, MD (USA)). Sep 1982. Contract AC06-76RL01830. 193p. NTIS, PC A09/MF A01. Order Number DE83007219.

This area report describes the environmental characteristics of the Dalhart and Palo Duro basins of the Texas Panhandle portion of the Permian basin. Both basins are rather sparsely populated, and the overall population is decreasing. The economic base is centered on agribusiness and manufacturing. Most of the potentially conflicting land uses in both basins (i.e., parks, historic sites) occupy small land areas, with the exception of a national grassland in the Dalhart and military air training routes in both basins. Ground transportation in the Dalhart basin is adequate, and it is well developed in the Palo Duro basin. In both basins irrigation constitutes the principal water use, and groundwater is the principal source. However, the dominant aquifer, the Ogallala, is being depleted. Both basins consist primarily of grasslands, rangelands, and agricultural areas. No critical terrestrial or aquatic habitats have been identified in the basins, though several endangered, threatened, or rare terrestrial species occur in or near the basins. Aquatic resources in both basins are limited because of the intermittent availability of water and the high salt content of some water bodies. Playa lakes are common, though usually seasonal or rain dependent. The climate of the area is semiarid, with low humidity, relatively high wind speeds, and highly variable prcipitation. Restrictive dispersion conditions are infrequent. National ambient secondary air quality standards for particulates are being exceeded in the area, largely because of fugitive dust, although there are some particulate point sources.

19860 (ONWI—102-Vol.2) Area environmental characterization report of the Dalhart and Palo Duro basins in the Texas Panhandle. Volume II. Palo Duro basin. (NUS Corp., Gaithersburg, MD (USA)). Sep 1982. Contract AC06-76RL01830. 303p. NTIS, PC A14/MF A01. Order Number DE83007215.

This area report describes the environmental characteristics of the Dalhart and Palo Duro basins of the Texas Panhandle portion of the Permian basin. Both basins are rather sparsely populated, and the overall population is decreasing. The economic base is centered on agribusiness and manufacturing. Most of the potentially conflicting land uses in both basins (i.e., parks, historic sites) occupy small land areas, with the exception of a national grassland in the Dalhart and military air training routes in both basins. Ground transportation in the Dalhart basin is adequate, and it is well developed in the Palo Duro basin. In both basins irrigation constitutes the principal water use, and groundwater is the principal source. However, the dominant aquifer, the Ogallala, is being depleted. Both basins consist primarily of grasslands, rangelands, and agricultural areas. No critical terrestrial or aquatic habitats have been identified in the basins, though several endangered, threatened, or rare terrestrial species occur in or near the basins. Aquatic resources in both basins are limited because of the intermittent availability of water and the high salt content of some water bodies. Playa lakes are common, though usually seasonal or rain dependent. The climate of the area is semiarid, with low humidity, relatively high wind speeds, and high variable precipitation. Restrictive dispersion conditions are infrequent. National ambient secondary air quality standards for particulates are being exceeded in the area, largely because of fugitive dust, although there are some particulate point sources.

19861 (PB—82-227042) Two hypothetical problems in radioactive waste management: a comparison of cost/benefit analysis and decision analysis. Watson, S.R.; Hayward, G.M. (Cambridge Univ. (UK). Dept. of Engineering). Mar 1982. 35p. NTIS, PC A03/MF A01.

In particular the presentation has argued that Decision Analysis (DA) has considerable advantages over Cost Benefit Analysis (CBA), a view which may not be acceptable to practitioners of CBA. The criticism may be levelled that the authors have misinterpreted CBA in order to make their point. As mentioned above, however, the authors have taken a particular view of CBA in order to emphasize the distinction between an approach based in economics, and one based in psychology and management studies. Moreover many formal analyses of public policy today contain elements from both approaches, so that the distinction between CBA and DA may not be as clear-cut as indicated. There is however a basic difference of approach which it is hoped has been spelt out in the studies of chapters 2 and 3; the essential difference is between a device which seeks to determine what is socially best, in an objective manner, and a device to assist a group of decision-makers in clarifying their understanding of a complex decision problem.

19862 (PB—83-104042) Results of hydrologic tests and water-chemistry analyses, wells H-6A, H-6B, and H-6C, at the proposed Waste Isolation Pilot Plant site, southeastern New Mexico. Water resources investigations (final). Dennehy, K.F. (Geological Survey, Albuquerque, NM (USA). Water Resources Div.). Jan 1982. 79p. NTIS, PC A05/MF A01.

Hydrologic testing was conducted at wells H-6A, H-6B, and H-6C in the northwestern part of the proposed Waste Isolation Pilot Plant site in southeastern New Mexico to define hydraulic properties of three water-bearing zones. The zones tested were the Magenta and Culebra Dolomite Members of the Rustler Formation and the Rustler Formation-Salado Formation contact. The Magenta Dolomite and the Rustler-Salado contact yield water to wells at rates less than 0.5 gallon per minute as determined from shut-in and slug tests. A transmissivity value for the Culebra Dolomite Member was obtained by conducting conventional pumping and recovery tests in well H-6B; this well was pumped at a rate of approximately 11 gallons per minute. Water samples from the Magenta Dolomite Member of the Rustler Formation had a dissolved-solids concentration of 5,760 milligrams per liter. The major chemical constituents of water samples from this zone were sulfate, sodium, and chloride. Water samples from the Culebra Dolomite Member of the Rustler Formation had dissolved-solids concentration of 52,600 milligrams per liter, and samples from the Rustler Formation-Salado Formation contact had 316,000 milligrams per liter; chloride and sodium were the major constituents in the water samples. Radium-226, a naturally occurring radioactive element, was present in samples from all three zones.

19863 (RFP—3492) Actinide removal from waste solutions by ferrite treatment. Boyd, T.E.; Kochen, R.L. (Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant). 1983. Contract AC04-76DP03533. 7p. (CONF-830205—12). NTIS, PC A02/MF A01. Order Number DE83007536.

From Waste management conference; Tucson, AZ, USA (27 Feb 1983).

In laboratory tests, ferrite treatment was effective in removing actinides from Rocky Flats process waste. Plutonium concentrations were consistently lowered from over 10^{-4} g/l to the 10^{-7} to 10^{-8} g/l range. At the same time, 3.2 to 3.6 g/l solids were produced as compared to 15.7 g/1 observed over a recent 16-month period for waste treatment by flocculant precipitation. Whereas ferrite treatment required only one treatment step, at least two treatment steps are needed for flocculant precipitation to achieve the same results. Greater loadings of ferrite in a cement matrix were obtained so that very significant weight and volume reduction in immobilized solid TRU waste were observed. In addition to its effectiveness in actinide removal, ferrite waste treatment has shown considerable versatility, which would facilitate its application to a variety of waste media. There are two treatment to be used in different chemical environments. Whereas the in situ method is affected by the presence of other metal ions, the preformed ferrite addition technique is much less sensitive to the chemistry of the waste medium. Because of their strongly magnetic nature, ferrite solids can be separated magnetically in addition to techniques such as filtration and centrifugation.

19864 (RHO-BW-SR—82-2-2Q-P) Basalt Waste Isolation Project drilling and testing. Quarterly report, April 1, 1982-June 30, 1982. (Rockwell International Corp., Richland, WA (USA). Energy Systems Group). 1 Jul 1982. Contract AC06-77RL01030. 45p. NTIS, PC A03/MF A01. Order Number DE83007947.

This document is a summary of drilling and testing results during the second calendar quarter (April through June 1982). The principal work during this period included the drilling and/or testing of boreholes RRL-2, DC-16A, DC-7/8, DC-15, DH-24, DH-25, McGee and BH-17. Specific highlights of this work are summarized.

19865 (RHO-BW-SR—82-2-3Q-P) Basalt Waste Isolation Project drilling and testing. Quarterly report, July 1, 1982-September 30, 1982. (Rockwell International Corp., Richland, WA (USA). Energy Systems Group). 1 Oct 1982. Contract AC06-77RL01030. 51p. NTIS, PC A04/MF A01. Order Number DE83008195.

This document is a summary of drilling and testing results during the third calendar quarter (July through September 1982). The principal work during this period included the drilling and/or testing of boreholes RRL-2, RRL-6, RRL-14, DC-3, DC-16A, DC-16C, and the McGee Well. Specific highlights of this work are summarized.

19866 (SAND—79-0269) Basic data report for drillhole AEC 8 (Waste Isolation Pilot Plant - WIPP). (Sandia National Labs., Albuquerque, NM (USA); D'Appolonia Consulting Engineers, Albuquerque, NM (USA)). Jan 1983. Contract AC04-76DP00789. 154p. NTIS, PC A08/MF A01. Order Number DE83008481.

AEC 8 was originally drilled in 1974 to a depth of 3028 ft by Oak Ridge National Laboratory as part of the initial investigations of a site for radioactive waste disposal. In 1976, Sandia National Laboratories deepened the borehole from the top of the Castile Formation into the Bell Canyon Formation to test the hydraulic properties of the Bell Canyon. The borehole encountered in descending order Holocene sands (20 ft), Mescalero caliche (6 ft), Santa Rosa Sandstone (143 ft), Dewey Lake Redbeds (491 ft), Rustler Formation (322 ft), Salado Formation (1990 ft), Castile Formation (1335 ft), and the upper Bell Canyon Formation (603 ft). The borehole stratigraphy is in normal order and there is no significant deformation. An extensive suite of geophysical logs provides information on the lithology and stratigraphy. The potentiometric surfaces of Bell Canyon fluid-bearing zones are 550 ft (for the zone at 4821 ft to 4827 ft) and 565 ft below land surface (for the zone at 4844 to 4860 ft). The WIPP is a demonstration facility for the disposal of transuranic (TRU) waste from defense programs. The WIPP will also provide a research facility to investigate the interactions between bedded salt and high level wastes.

19867 (SAND—82-0793) Natural-convection experiments in a liquid-saturated porous medium bounded by vertical coaxial cylinders. Reda, D.C. (Sandia National Labs., Albuquerque, NM (USA)). Mar 1983. Contract AC04-76DP00789. 54p. NTIS, PC A04/MF A01. Order Number DE83007469.

An experimental effort is presently underway to investigate natural convection in liquid-saturated porous media utilizing a geometry, and hydrodynamic/thermal boundary conditions, relevant to the problem of nuclear-waste isolation in geologic repositories. During the first phase of this research program, detailed measurements were made of the steady-state thermal field throughout an annular test region boundary by a vertical, constant-heat-flux, inner cylinder and a concentrically-placed, constant-temperature, outer cylinder. An overlying, constant-pressure, fluid layer was utilized to supply a permeable upper surface boundary condition. Results showed the heater surface temperature to increase with increasing vertical distance due to the buoyantly-driven upflow. The measured temperature difference (ΔT) between the average heater surface temperature and the constant outer-surface temperature was found to be progressively below the straight-line/conduction-only solution for ΔT vs. power input as the latter was systematically increased. Comparisons between measured results and numerical predictions obtained using the finit-element code MARIAH showed very good agreement, thereby contributing to the qualification of this code for repository-design applications.

19868 (SAND—82-2413C) Approach to resolution of geologic uncertainty in the licensing of a high-level-waste repository in tuff. Neal, J.T. (Sandia National Labs., Albuquerque, NM (USA)). 1983. Contract AC04-76DP00789. 17p. (CONF-830315—1). NTIS, PC A02/MF A01. Order Number DE83006204.

From GSA symposium on geological licensing topics in high- and low-level nuclear waste; College Station, TX, USA (3 Mar 1983).

Resolution of uncertainty in geological information is an essential element in the licensing process for a geologic repository. Evaluation of these uncertainties within the licensing framework established by the Nuclear Regulatory Commission (NRC) is required. The Nevada Nuclear Waste Storage Investigations (NNWSI), in focusing its site characterization program on unsaturated tuff, has developed a logic hierarchy of technical issues, including key issues, issues, and information needs. Key issues are statements of major requirements whose lack could be disqualifying. An example of a key issue is the demonstration of radionuclide containment and isolation within the required release limits and transport time set by the EPA and NRC. Key issues are broken down into issues, such as the groundwater flow time to the accessible environment. Resolving uncertainty ultimately comes back to satisfying individual information needs that collectively form issues. Hydraulic conductivity is an example of an information need required to determine groundwater flow rate. Sources of uncertainty often arise in either amount, quality, or other limitations in geological data. The hierarchical structuring of geological information needs provides a perspective that allows proportionate attention to be placed on various site characterization activities, and to view them within the whole range of licensing issues that must be satisfied to ensure public health and safety. However, it may not prevent an issue from being contentious, as some geological questions are known to be emotion-laden. The mitigation of uncertainty in geological information ultimately will depend on the validity and credibility of the information presented during the licensing process.

19869 (STI/PUB—622) Management of wastes from uranium mining and milling. (International Atomic Energy Agency, Vienna (Austria)). Nov 1982. 726p. (CONF-820552—). UNIPUB, Box 433, Murray Hill Station, New York, NY 10016.

From International symposium on management of waste from uranium mining and milling; Albuquerque, NM, USA (10 May 1982).

The 45 papers published in these Proceedings were presented in seven sessions covering the following subjects: review of national programs; objectives and criteria for long-term management and disposal; concept evaluation for management and disposal; characterization of wastes; waste water treatment and tailings conditioning; decommissioning and rehabilitation technology development; radiological impact assessment; environmental surveillance and monitoring; radiation measurements; and national research and development programs. In addition, there is a summary of the panel discussion on the objectives, problems and solutions for waste management in the uranium mining and milling industry.

19870 Development of structural barriers for containment of nuclear waste in basalt. Westerman, R.E.; Nelson, J.L.; Pitman, S.G. (PNL). *Transactions of the American Nuclear Society;* **41**: 283(Jun 1982). (CONF-820609—).

From American Nuclear Society annual meeting; Los Angeles, CA, USA (6 Jun 1982).

19871 Materials for high-level waste canister/overpacks in salt formations. Molecke, M.A.; Diegle, R.B.; Ruppen, J.A. (Sandia National Laboratories, Albuquerque, NM 87185). *Transactions of the American Nuclear Society;* **41**: 284-285(Jun 1982). (CONF-820609—).

From American Nuclear Society annual meeting; Los Angeles, CA, USA (6 Jun 1982).

19872 Nuclear waste package program for high-level isolation in Nevada tuff. Rothman, A.J. (Lawrence Livermore National Laboratory, P.O. Box 808, Livermore, CA 94550). *Transactions of the American Nuclear Society;* **41**: 285(Jun 1982). (CONF-820609—).

19873 New directions in US waste management. Randenbush, M.H. (Stoller (S.M.) Corp., Boulder, CO (USA)); Smith, L.J. (Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant); Cruickshank, A. *Nuclear Engineering International;* **27**: No. 327, 21-26(May 1982).

Radioactive Waste Management in the United States is reviewed and the importance of politics in influencing progress is emphasised.

19874 Synroc technology for immobilizing U.S. defense waste. Newkirk, H.W.; Hoenig, C.L.; Ryerson, F.J.; Tewhey, J.D.; Smith, G.S.; Rossington, C.S.; Brackmann, A.J.; Ringwood, A.E. (Lawrence Livermore Natl Lab, CA, USA). *American Ceramic Society Bulletin;* **61**: No. 5, 559-566(May 1982).

Synroc technology has been applied to immobilize U.S. defense high level wastes similar to those stored at the Savannah

River Plant (SRP). Titanate-based ceramic waste-form specimens (Synroc D), containing simulated SRP sludge of average composition, were synthesized by conventional hot-pressing techniques. The waste-form specimens were characterized by x-ray diffraction and scanning electron microscopy, and their stability assessed by leaching methods. Major phases present are zinconolite, perovskite, spinel solid solution, nepheline, and a Cs-hollandite analog, prepared separately and added to the calcined powder before densification. Normalized single-day static leach rates for the major matrix elements in Synroc D using deionized water at 150°C are in the range 10/sup -2/ -10/sup -5/ g/m/sup 2/day. Static leach rates for cesium were 1.85 g/m/sup 2/day on the first day, decreasing to 1.7x10^{-1} b/m/sup 2/day after the third day. Dynamic leach rates for cesium in the Synroc-D waste form and in the (Ba,Cs)-hollandite analog material using deionized water at 75°C were 5x10/sup -1/ g Synroc D/m/sup 2/day on the first day, decreasing to 1.2x10/sup -2/ g Synroc D/m/sup 2/day after the 12th day, and 1x10/sup -1/g(Ba,Cs)-hollandite/m/sup 2/day on the first day, decreasing to 5x10/sup -4/ g (Ba,Cs)-hollandite/m/sup 2/day after 44 days, respectively. 45 refs.

19875 Method of deposition of silicon carbide layers on substrates. Angelini, P.; DeVore, C.E.; Lackey, W.J.; Blanco, R.E.; Stinton, D.P. US Patent Application 6-360,116. 19 Mar 1982. 18p. Contract W-7405-ENG-36.

A method for direct chemical vapor deposition of silicon carbide to substrates, especially nuclear waste particles, is provided by the thermal decomposition of methylsilane at 800 to 1050°C when the substrates have been confined within a suitable coating environment.

19876 Leach characterization of cement encapsulated wastes. Roy, D.M.; Scheetz, B.E.; Wakeley, L.D.; Barnes, M.W. (Pa State Univ, University Park, USA). *Nuclear and Chemical Waste Management;* 3: No. 1, 35-42(1982).

Matrix encapsulation of defense nuclear waste as well as intermediate-level commercial wastes within a low-temperature cementitious composite were investigated. The cements for this study included both as-received and modified calcium silicate and calcium aluminate cements. Specimens were prepared following conventional formulation techniques designed to produce dense monoliths, followed by curing at 60°C. An alternative preparation procedure is contrasted in which the specimens were "warm" pressed in a uniaxial press at 150°C at 50,000 psi for 0.5 h. Specimens of the waste/cement composites were leached in deionized water following three different procedures which span a wide range of temperatures and solution saturation conditions. Aluminate and compositionally adjusted silicate cements exhibited a better retentivity for Cs and Sr than did the as-received silicate cement. 15 refs.

19877 Concept of a canister for high-level radioactive waste. McCoy, H.E. (Oak Ridge Natl Lab, TN, USA). *Nuclear and Chemical Waste Management;* 3: No. 1, 51-57(1982).

The specific problem of developing a canister for the multibarrier waste isolation concept was considered. A conceptual design was developed for a canister that is relatively easy to fabricate, inspect, and handle. The design has the option of storing the canister or adding an overpack before storage. The costs for canisters made of three materials were estimated. Sufficient resources exist to allow the use of several common metals without significant impact on expected availability. 17 refs.

19878 Dissolution of tailored ceramic nuclear waste forms. Clarke, D.R.; Jantzen, C.M.; Harker, A.B. (Rockwell Int, Thousand Oaks, CA, USA). *Nuclear and Chemical Waste Management;* 3: No. 1, 59-66(1982).

Dissolution experiments on polyphase, high alumina tailored ceramic nuclear waste forms developed for the chemical immobilization of Savannah River Plant nuclear waste are described. Three forms of leach tests have been adopted; bulk samples conforming to the Materials Characterization Center Static Leach Test (MCC-1), a powdered sample leach test, and a leach test performed on transmission electron microscope thin foil samples. From analysis of these tests the crystalline phases that preferentially dissolve on leaching and the product phases formed are identified and related to the tailoring and processing schemes used in forming the ceramics. The thin foil sample leaching enables the role of intergranular amorphous phases as short-circuit leaching paths in polyphase ceramics to be investigated.

19879 (ANL/EIS—16) Methods for assessing environmental impacts of a FUSRAP property-cleanup/interim-storage remedial action. Wyman, D.J. (ed.). (Argonne National Lab., IL (USA)). Dec 1982. Contract W-31-109-ENG-38. 237p. NTIS, PC A11/MF A01. Order Number DE83008181.

This document provides a description of a property-cleanup/interim-storage action, explanation of how environmental impacts might occur, comprehensive treatment of most potential impacts that might occur as a result of this type of action, discussion of existing methodologies for estimating and assessing impacts, justification of the choice of specific methodologies for use in FUSRAP environmental reviews, assessments of representative impacts (or expected ranges of impacts where possible), suggested mitigation measures, and some key sources of information. The major topical areas covered are physical and biological impacts, radiological impacts, and socioeconomic impacts. Some project-related issues were beyond the scope of this document, including dollar costs, specific accident scenarios, project funding and changes in Congressional mandates, and project management (contracts, labor relations, quality assurance, liability, emergency preparedness, etc.). These issues will be covered in other documents supporting the decision-making process. Although the scope of this document covers property-cleanup and interim-storage actions, it is applicable to other similar remedial actions. For example, the analyses discussed herein for cleanup activities are applicable to any FUSRAP action that includes site cleanup.

19880 (ANL/EIS—17) Scoping survey of perceived concerns, issues, and problems for near-surface disposal of FUSRAP waste. Robinson, J.E.; Gilbert, T.L. (Argonne National Lab., IL (USA)). Dec 1982. Contract W-31-109-ENG-38. 138p. NTIS, PC A07/MF A01. Order Number DE83007849.

This report is a scoping summary of concerns, issues, and perceived problems for near-surface disposal of radioactive waste, based on a survey of the current literature. Near-surface disposal means land burial in or within 15 to 20 m of the earth's surface. It includes shallow land burial (burial in trenches, typically about 6 m deep with a 2-m cap and cover) and some intermediate-depth land burial (e.g., trenches and cap similar to shallow land burial, but placed below 10 to 15 m of clean soil). Proposed solutions to anticipated problems also are discussed. The purpose of the report is to provide a better basis for identifying and evaluating the environmental impacts and related factors that must be analyzed and compared in assessing candidate near-surface disposal sites for FUSRAP waste. FUSRAP wastes are of diverse types, and their classification for regulatory purposes is not yet fixed. Most of it may be characterized as low-activity bulk solid waste, and is similar to mill tailings, but with somewhat lower average specific activity. It may also qualify as Class A segregated waste under the proposed 10 CFR 61 rules, but the parent radionuclides of concern in FUSRAP (primarily U-238 and Th-232) have longer half-lives than do the radionuclides of concern in most low-level waste. Most of the references reviewed deal with low-level waste or mill tailings, since there is as yet very little literature in the public domain on FUSRAP per se.

19881 (LA—9398-MS) Evaluation of environmental control technologies for commercial uranium nuclear fuel fabrication facilities. Perkins, B.L. (Los Alamos National Lab., NM (USA)). Jan 1983. Contract W-7405-ENG-36. 62p. NTIS, PC A04/MF A01. Order Number DE83008362.

At present in the United States, there are seven commercial light-water reactor uranium fuel fabrication facilities. Effluent wastes from these facilities include uranium, nitrogen, fluorine, and organic-containing compounds. These effluents may be either discharged to the ambient environment, treated and recycled internally, stored or disposed of on-site, sent off-site for treatment and/or recovery, or sent off-site for disposal (including disposal in low-level waste burial sites). Quantities of waste generated and treatment techniques vary greatly depending on the facility and circuits used internally at the facility, though in general all the fluorine entering the facility as UF_6 is discharged as waste. Further studies to determine techniques and procedures that might minimize dose (ALARA) and to give data on possible long-term effects of effluent discharge and waste disposal are needed.

19882 **(NUREG—0959) User's guide for 10 CFR 61 impact analysis codes.** Widmayer, D.A. (Nuclear Regulatory Commission, Washington, DC (USA). Div. of Waste Management). Jan 1983. 134p. NTIS, PC A07/MF A01 - GPO $6.00. Order Number DE83901490.

This document explains how to use the Impact Analysis Codes used in the Draft Environmental Impact Statement (DEIS) (NUREG-0782, Vol. 1-4) supporting 10 CFR 61, Licensing Requirements for Land Disposal of Radioactive Waste. The mathematical development of the impact Analysis Codes and other information necessary to understand the results of using the Codes is contained in the DEIS, and in a supporting document, Data Base for Radioactive Waste Management (NUREG/CR-1759, Vol. 1-3). This document was prepared with the intention of accompanying a computer magnetic tape containing the Impact Analysis Codes. A form is included at the end of this document which can be used to obtain such a tape.

19883 **(NUREG/CR—2394) PATH1 self-teaching curriculum: example problems for Pathways-to-Man Model.** Helton, J.C.; Finley, N.C. (Sandia National Labs., Albuquerque, NM (USA)). Oct 1982. Contract AC04-76DP00789. 116p. (SAND—81-2377). NTIS PCE06/MF $4.75 - GPO $7.00. Order Number DE83007228.

The Pathways-to-Man Model was developed at Sandia National Laboratories to represent the environmental movement and human uptake of radionuclides. This model is implemented by the computer program PATH1. The purpose of this document is to present a sequence of examples of facilitate use of the model and the computer program which implements it. Each example consists of a brief description of the problem under consideration, a discussion of the data cards required to input the problem to PATH1, and the resultant program output. These examples are intended for use in conjunction with the technical report which describes the model and the computer progam which implements it (NUREG/CR-1636, Vol 1; SAND78-1711). In addition, a sequence of appendices provides the following: a description of a surface hydrologic system used in constructing several of the examples, a discussion of mixed-cell models, and a discussion of selected mathematical topics related to the Pathways Model. A copy of the program PATH1 is included with the report.

19884 **(NUREG/CR—2675) Relevance of biotic pathways to the long-term regulation of nuclear waste disposal. Topical report on reference eastern humid low-level sites.** McKenzie, D.H.; Cadwell, L.L.; Eberhardt, L.E.; Kennedy, W.E. Jr.; Peloquin, R.A.; Simmons, M.A. (Pacific Northwest Lab., Richland, WA (USA)). Jan 1983. Contract AC06-76RL01830. 56p. (PNL—4241-Vol.3). NTIS, PC A04/MF A01 - GPO $4.75. Order Number DE83007188.

The purpose of the work reported here was to develop an order-of-magnitude estimate for the potential dose to man resulting from biotic transport mechanisms at a humid reference low-level waste site in the eastern US. A description of the reference site is presented that includes the waste inventories, site characteristics and biological communites. Parameter values for biotic transport processes are based on data reported in current literature. Transport and exposure scenarios are developed for assessing biotic transport during 500 years following site closure. Calculations of radionuclide decay and waste container decomposition are made to estimate the quantities available for biotic transport. Doses to man are calculated for the biological transport of radionucludes at the reference site after loss of institutional control. These dose estimates are compared to dose estimates we calculated for the intruder-agricultural scenarios reported in the DEIS for 10 CFR 61 (NRC). Dose to man estimates as a result of cumulative biotic transport are calculated to be of the same order-of-magnitude as the dose resulting from the more commonly evaluated human intrusion scenario. The reported lack of potential importance of biotic transport at low-level waste sites in earlier assessment studies is not confirmed by findings presented in this report. Through biotic transport, radionuclides can be moved to locations where they can enter exposure pathways to man.

19885 **(NUREG/CR—3032) Studies of transport of waste radionuclides, through soil at the Maxey Flats, Kentucky, waste-burial site.** Fowler, E.B.; Polzer, W.L.; Essington, E.H. (Los Alamos National Lab., NM (USA)). Jan 1983. Contract W-7405-ENG-36. 72p. (LA—9565-MS). NTIS, PC A04/MF A01. Order Number DE83007771.

Two areas at the waste-burial site are being used to study the interaction of soil with liquid waste - one near Trench 19S and the other between an experimental trench and Trench 27. Analyses of soil solutions near Trench 19S indicate that radionuclides have migrated from the waste-burial trench. The observed distribution of radionuclides in that area suggests that ^{3}H, as tritiated water, has moved the greatest distance. Movement of ^{137}Cs is essentially nonexistent. The migration of ^{238}Pu and ^{60}Co lies between those two extremes. The distance that ^{3}H has moved, at an approximated depth of 4 m, is about 9 m. Additional porous cup samplers were installed at depths to 8 m to better evaluate the distribution of radionuclides near Trench 19S. Results from soil moisture measurements by R.K. Schulz of the University of California at Berkeley indicate a preferential movement of water into the waste trench through its cap. Our study of the ^{3}H in surface soils outside the perimeter fence of the burial site suggests that contamination of the near-surface soil water occurs and could be from an airborne source, possible originating from the site evaporator. Another localized source could be associated with underflow from a burial trench that surfaces outside the perimeter fence. The ^{3}H content in some soil solutions near an experimental trench suggest a preferential movement of water along an interface of an original soil profile and the overlying landfill. If such an interface were to intercept a burial trench and also outcrop off site, it could act as a preferential pathway for transport of radionuclides off site. The nonsorptive behavior of a small fraction of ^{238}Pu in the Maxey Flats waste was interpreted as having been caused by an organic complex that is very slowly biodegradable. Organic constituents in the Maxey Flats soil, Tilsit Ap, may complex some of the ^{238}Pu, making it mobile for some period of time.

19886 **(PB—82-251992) Contamination of ground and surface waters due to uranium mining and milling. Volume I: Biological processes for concentrating trace elements from uranium mine waters. Open file report 25 Jul 79-14 Sep 81.** Brieley, C.L.; Brierley, J.A. (New Mexico Bureau of Mines and Mineral Resources, Socorro (USA)). Nov 1981. 105p. NTIS, PC A06/MF A01.

Wastewater from uranium mines in the Ambrosia Lake district near Grants, N. Mex., contains uranium, selenium, radium, and molybdenum. A novel treatment process for waters from two mines, sections 35 and 36, to reduce the concentrations of the trace contaminants was developed. Particulates are settled by ponding and the waters are passed through an ion exchange resin to remove uranium; barium chloride is added to precipitate sulfate and radium from the mine waters. The mine waters are subsequently passed through three consecutive algae ponds prior to discharge. Water, sediment, and biological samples were collected over a 4-year period and analyzed to assess the role of biological agents in removal of inorganic trace contaminants from the mine waters.

19887 **(RHO-BW-ST—35P) Radionuclide sorption on basalt-interbed materials. Annual report FY 1981.** Barney, G.S. (Rockwell International Corp., Richland, WA (USA). Energy Systems Group). Oct 1982. Contract AC06-77RL01030. 70p. NTIS, PC A04/MF A01. Order Number DE83008062.

Sorption and precipitation of key radionuclides in the groundwater/rock systems expected in Columbia River interbed zones were investigated. Sorption isotherms were defined for sorption of Cs, Sr, Se, Tc, Ra, U, Np, and Am on an interbed sandstone standard from the Rattlesnake Ridge interbed. In addition, the effect of groundwater composition and redox potential on sorption and precipitation of these radionuclides on interbed sandstone and tuff were studied. Isotherms were measured at 23°C, 60°C, and 85°C. The Freundlich equation accurately fits the isotherm data when precipitation does not occur. Solubility limits were obtained for technetium and selenium using the isotherms. Cesium, selenium, technetium, uranium, and americium sorption are strongly affected by temperature over the 23°C to 85°C range. The major chemical components of Grande Ronde groundwater (Na^+, Ca^{2+}, K^+, Mg^{2+}, Cl^-, F^-, CO_3^{2-}, HCO_3^-, and SO_4^{2-}) were studied for their influence on sorption and precipitation. Statistically designed experiments identified significant groundwater components and measured their effects. The results gave evidence for selecting sorption mechanisms for each radionuclide (ion exchange, chemisorption, redox reactions, complex formation, or precipitation). Strontium, radium, and cesium are sorbed by ion exchange and compete for exchange sites with ions of similar size. Neptunium, plutonium, and technetium are reduced by hydrazine to their (IV) oxidation states and are sorbed by chemisorption. Selenium is not reduced to the metal by hydrazine, but appears to be precipitated as a calcium compound. The groundwater variables had little effect on americium sorption. A slightly soluble americium compound appears to form which is more soluble at low pH.

19888 (UCID—19729) Leaching study of nuclear melt glass: Part I. Failor, R.A.; Coles, D.G.; Rego, J.A.H. (Lawrence Livermore National Lab., CA (USA)). 23 Feb 1983. Contract W-7405-ENG-48. 76p. NTIS, PC A05/MF A01. Order Number DE83008312.

Ground samples of three nuclear melt glasses from underground nuclear explosions at the Nevada Test Site (NTS) were leached at 25°C with natural ground water from NTS. Using our dynamic single-pass flow-through leaching system we monitored the release of radionuclides from the glasses during 420 days of leaching. We continually flowed the ground water over the melt glass at flow rates of 185 ml/day for half of the samples and 34 ml/day for the rest. Leachate solutions were collected continuously, and composite samples, collected on days 1, 2, 3, 6, 11, 32, 38, 70, 120, 230 and 420, were analyzed using low-background Ge(Li) gamma spectrometers. For most of the radionuclides the leach rate decreased smoothly throughout the experiment. Except for ^{95}Zr, ^{144}Ce, and ^{155}Eu, there was no difference between the fast (185 ml/day) and slow (34 ml/day) flow-rate leach rates. The measurable leach rates ranged from a high of 1×10^{-2} g-glass/m^2 day for ^{22}Na (slow flow-rate, day 1 in glass No. 2) to a low of 1×6^{-6} g-glass/m^2 day for ^{54}Mn (slow flow-rate, day 420 in glass No. 2). Most of the leach-rate values were about 5×10^{-4} g-glass/m^2 day initially, decreasing to 5×10^{-6} g-glass/m^2 day after 420 days of leaching. The leach rates had not leveled off by the end of the experiment and were, in general, continuing to decrease. From the activities in the leachate solutions, we determined the percent of the pre-leach activity leached from the melt glasses during the experiment. Only ^{124}Sb, in one fast flow-rate channel of glass No. 2, exceeded 3% of the initial activity leached. The majority of the samples released less than 1% of the pre-leach activity for a given radionuclide. The percent activity released from the samples leached at the fast and slow flow rates were nearly equal.

REFER ALSO TO CITATION(S) 19804, 19805, 19813, 19815, 19816, 19870, 19872, 19883, 20561, 21360, 21361, 21362, 21363, 21364, 21365, 21366, 21587

19889 (ANL—83-6) Environmental surveillance of the Palos Park Forest Preserve. Golchert, N.W.; Sedlet, J.; Hayes, K.A. (Argonne National Lab., IL (USA)). Jan 1983. Contract W-31-109-ENG-38. 72p. NTIS, PC A04/MF A01. Order Number DE83007809.

This is the second report describing an ongoing environmental surveillance program conducted at the Palos Park Forest Preserve near Chicago, Illinois. The Preserve was a site of a nuclear research laboratory (Site A) from 1943 to 1956 and a radioactive waste burial site (Plot M) from 1944 to 1949. An extensive radiological characterization of the site was conducted from February 1976 to August 1977, and tritium in the form of water was found to be the only radionuclide that migrated from the nuclear facilities. The results were published in US Department of Energy Report DOE/EV-0005/7. The present report summarizes the earlier findings and gives the detailed results of the work from August 1977 through December 1981. The vertical and horizontal distribution of tritium within the glacial till was determined from measurements of tritium in soil moisture. Chemical and radiochemical analyses were performed on a number of wells in the area. Tritiated water continued to be the only species that was observed to have migrated from the Plot M area. Migration from the Site A area was not observed. The concentration of tritium at the Red Gate Woods well, 1200 ft downgradient from Plot M, continued to show the seasonal fluctuations of high concentrations in the winter and low concentrations in the summer. Monitoring of the Palos Park area is continuing.

19890 (DOE/EV—0005/22) Formerly utilized MED/AEC sites remedial action program. Radiological survey of the National Guard Armory at Washington Park, 52nd Street and Cottage Grove Avenue, Chicago, Illinois, September 19, 1977-October 11, 1978. Wynveen, R.A.; Smith, W.H.; Mayes, C.B.; Justus, A.L. (Argonne National Lab., IL (USA)). Jan 1983. Contract W-31-109-ENG-38. 135p. (ANL-OHS/HP—83-100). NTIS, PC A07/MF A01. Order Number DE83007808.

A comprehensive radiological survey was conducted at the Illinois National Guard Armory at Washington Park in Chicago. This facility, used for uranium processing during the MED/AEC era, is now used as offices, classrooms, and storage and garage areas. Forty-two spots of contaminaton in nine rooms or areas exceeded the allowable limits for uranium as given in the ANSI Standard N13.12. In most instances, the contamination was found to be removable and available for transfer to other locations. However, under current use conditions, the potential for radiation exposure to occupants of this building from these sources of contamination is small. Concentrations of radon daughters in the air in the building, as measured by grab-sampling techniques, were less than the limit of 0.01 WL above background as given in the Surgeon General's Guidelines in 10 CFR 712. No long-lived radionuclides were detected in any air sample. Concentrations of radionuclides in soil samples collected around the facility indicated essentially background levels. The presumed maximum 50-year dose commitments from potential inhalation/ingestion of residual contamination were calculated to be 2.5 mrem to the lung, 0.51 mrem to the bone, 0.12 mrem to the kidney, and 0.031 mrem wholebody; each of these is less than 0.5% of the appropriate standards for an individual in an uncontrolled area. In order to rduce the potential for radiation exposure, remedial measures such as stabilization of the contamination in place would be applicable as a short-term measure. In order to reduce the risk in the event that building modifications take place in the future, health physics procedures and coverage are recommended. The long-term solution would involve dcontamination by removal of the radioactive residues from the 11 rooms or areas in the facility.

19891 (DOE/LLW—17T) Survey of chemical and radiological indexes evaluating toxicity. National Low-Level Radioactive Waste Management Program. (EG and G Idaho, Inc., Idaho Falls (USA)). Mar 1983. Contract AC07-76ID01570. 140p. NTIS, PC A07/MF A01. Order Number DE83008307.

This document reviews and evaluates 18 chemical and radiation standards, criteria, and measures that might form the basis of a combined radiochemical toxicity index for low-level radioactive waste. Six measures are recommended for the index basis and evaluated in greater detail. These measures include Water Quality Criteria, Lethal Dose and Concentration Levels, short-term bioassay, Multimedia Environmental Goals, and radiological dose factors.

19892 (NUREG/CR—3120) Quality assurance for measurements of ionizing radiation. Annual report for FY 1982. Eisenhower, E.H.; Ehrlich, M.; Soares, C.; Schima, F.J.; Seltzer, S. (National Bureau of Standards, Washington, DC (USA)). Feb 1983. 73p. NTIS, PC A04/MF A01 - GPO $5.00. Order Number DE83901533.

This report describes results of the second year of a program that will enable the Nuclear Regulatory Commission to improve, demonstrate, and document traceability of its measurements to the national physical measurement standards for ionizing radiation. The principal actions being taken are: (1) characterization of the response of thermoluminescence dosimetry systems used for routine surveillance of nuclear facilities; (2) type testing and characterization of portable survey instruments; and (3) implementation of routine quality assurance services that will demonstrate that regulatory measurements are sufficiently consistent (in agreement) with national measurement standards. During the year, some tests of the TLD system were performed as specified in American National Standard N545-1975, specifically self-irradiation, directional dependence, humidity dependence at extreme temperatures, and salt spray. Measurement assurance tests were conducted for the NRC Region-1 laboratory. The response of six portable survey instruments to beta radiation from xenon-133 was determined using a specially-built chamber for exposure to gaseous sources. The basic principles under which the long-range interactive MQA program will operate have been developed and documented, along with procedures for obtaining essential information from participating laboratories.

19893 (PB—83-114868) Engineering evaluation of radon daughter removal techniques. Open file report (final). Lindsay, D.B.; Lawter, J.R.; Jashnani, I. (Little (Arthur D.), Inc., Cambridge, MA (USA)). Apr 1978. 209p. NTIS, PC A10/MF A01.

This report presents the findings of an investigation of a number of techniques for cleaning ambient air with special emphasis on their applicability to the removal of the short-lived radioactive decay products of 222-radon, the so-called 'radon daughters' that have been identified with the induction of lung cancer in underground uranium miners. The purpose of the study was to review the requirements for control of radon daughter concentrations in mine air, and to examine all techniques whose feasibility has been demonstrated in principle and that would be capable of meeting those requirements. The study included a review of all pertinent literature, both technical and proprietary, on the subject of the control of miner exposure to the radon daughters and in the area of potentially applicable air-cleaning technology. Information about the nature of the problem and about the experience of the uranium mining industry in applying air-cleaning methods to its solution was obtained by visiting mines where such methods are in use and by correspondence and telephone conversations with other industry sources.

19894 (PNL-SA—10696) Beta measurement evaluation and upgrade. Murphy, D.W.; Faust, L.G.; Selby, J.M.; Essig, T.H.; Vallario, E.J. (Pacific Northwest Lab., Richland, WA (USA); Department of Energy, Washington, DC (USA)). Jan 1983. Contract AC06-76RL01830. 5p. (CONF-830204—7). NTIS, PC A02/MF A01. Order Number DE83007842.

From International beta dosimetry symposium; Washington, DC, USA (15 Feb 1983).

The Department of Energy (DOE), Office of Nuclear Safety, initiated a program to evaluate dosimeters and instruments used at DOE laboratories in the determination of personnel beta dose. The program focuses on significant problems which affect field measurements and is involved in the development and evaluation of new beta dosimetry systems (both dosimeters and instruments). Currently the program is reviewing systems and practices; developing calibration systems and procedures for the calibration of instruments and dosimeters; and developing new concepts which may improve beta dosimetry. The program has been designed to provide a continuing effort for resolution of problems of assessing personnel beta dose at DOE facilities. The current personnel beta dosimetry practices at DOE facilities are being surveyed.

19895 (CONF-821119—13) Isotope correlations for safeguards surveillance and accountancy methods. Persiani, P.J.; Kalimullah. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 21p. (IAEA-SM—260/85). NTIS, PC A02/MF A01. Order Number DE83007746.

From International symposium on recent advances in nuclear materials safeguards; Nienna, Australia (8 Nov 1982).

Isotope correlations corroborated by experiments, coupled with measurement methods for nuclear material in the fuel cycle have the potential as a safeguards surveillance and accountancy system. The ICT allows the verification of: fabricator's uranium and plutonium content specifications, shipper/receiver differences between fabricator output and reactor input, reactor plant inventory changes, reprocessing batch specifications and shipper/receiver differences between reactor output and reprocessing plant input. The investigation indicates that there exist predictable functional relationships (i.e. correlations) between isotopic concentrations over a range of burnup. Several cross-correlations serve to establish the initial fuel assembly-averaged compositions. The selection of the more effective correlations will depend not only on the level of reliability of ICT for verification, but also on the capability, accuracy and difficulty of developing measurement methods. The propagation of measurement errors through the correlations have been examined to identify the sensitivity of the isotope correlations to measurement errors, and to establish criteria for measurement accuracy in the development and selection of measurement methods. 6 figures, 3 tables.

19896 (NUREG—0430-Vol.3-No.1) Licensed fuel facility status report. Inventory difference data, January-June 1982. (Nuclear Regulatory Commission, Washington, DC (USA). Office of Inspection and Enforcement). Feb 1983. 14p. NTIS, PC A02/MF A01 - GPO. Order Number DE83901536.

NRC is committed to the periodic publication of licensed fuel facilities inventory difference data, following agency review of the information and completion of any related investigations. Information in this report includes inventory difference data for active fuel fabrication facilities possessing more than one effective kilogram of high enriched uranium, low enriched uranium, plutonium, or uranium-233.

19897 (NUREG/CR—2935) Examples of MC and A systems to meet prompt accountability specifications. Eggers, R.F.; Brouns, R.J.; Bryant, J.L.; Davenport, L.C.; Brite, D.W.; Kinnison, R.R.; Fager, J.E.; Williams, R.C.; Wilson, R.L. (Pacific Northwest Lab., Richland, WA (USA)). Jan 1983. Contract AC06-76RL01830. 292p. (PNL—4336). NTIS, PC A13/MF A01 - GPO $8.50. Order Number DE83007534.

Proposed regulations for NRC licensees authorized to possess and process formula quantities of strategic special nuclear material (SSNM) would require each licensee to implement a material control and accounting (MC and A) system capable of prompt loss detection and alarm resolution. In support of the loss detection and alarm response activities an overcheck program would also be implemented. This program would include personnel qualification and training, quality control, inventory verification and shipper-receiver transaction verification. However, the frequeny of physical inventory verification would be about once per year rather than once every two months. In addition MC and A activities would include procedures for the prevention and detection of data falsification and other forms of deceit that might undermine the performance of the loss detection and response systems. This report provides examples of prompt accountability systems for four plants: mixed oxide fuel fabrication, uranium hexafluoride conversion, high enriched uranium fuel fabrication, and high enriched uranium scrap recovery. Purpose of this report is to provide guidance to the MC and A system designer and evaluator on how the proposed requirements might be met.

19898 **Model for absorption-modified multiplication effects in the assay of HEU-containing powders in a random driver.** Winslow, G.H. (Argonne Natl Lab, IL, USA). *Nuclear Materials Management;* 10: No. 1, 28-33(Spr 1981).

A model has been developed which describes the enhancement of the response, in a random driver, of a "stack" of highly enriched uranium of arbitrary height over the integral of the response of infinitessimal layers that would be produced solely by the interrogating sources which are external to the stack. It has been suggested that this method of modeling should also be applicable to powders. This paper is a report on the form the model takes for that application. 4 refs.

19899 **Demonstration of near-real-time accounting: the AGNS 1980 miniruns.** Cobb, D.D.; Dayem, H.A.; Baker, A.L.; Ellis, J.H.; Ehinger, M.H.; Crawford, J.M. (Los Alamos Natl Lab, NM, USA). *Nuclear Materials Management;* 10: No. 1, 34-43(Spr 1981).

During 1980-81 a series of minirun experiments was being conducted at the AGNS Barnwell Nuclear Fuels Plant. Each experiment consists of operating the second and third plutonium cycles continuously for approximately one week using natural uranium solutions. One of the main objectives of the miniruns is to demonstrate near-real-time accounting and control techniques in a large, modern reprocessing facility. The results of five of these miniruns during 1980 are reported. 8 refs.

06 FUSION FUELS

0602 Processing

19900 **Low density, microcellular foams, preparation, and articles.** Young, A.T. US Patent Application 6-354,553. 3 Mar 1982. 19p. Contract W-7405-ENG-36.

A microcellular low-density foam of poly(4-methyl-1-pentene) particularly useful for forming targets for inertial confinement fusion has been developed. Articles made from the foam have been machined to tolerances of 0.0001 inch, although the densities of the fragile foam are low (about 10 to about 100 mg/cc) and the cell sizes are small (about 10 to about 30 μm). Methods for forming the foam and articles are given. The yield strength of the foam of the invention is higher than was obtained in other structures of this same material.

07 ISOTOPE AND RADIATION SOURCE TECHNOLOGY

19901 **(ANL/NESC—874) SANDIA-ORIGEN; isotope generation & depletion.** Bennett, D.E. (Sandia National Labs., Albuquerque, NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048874.

Maxima of - 10 discrete time-steps per subcase. .

SANDIA-ORIGEN is a point code (no spatial dependence) which calculates detailed isotopic compositions for a wide range of problems involving nuclear reactor fuel irradiation, neutron activation, and radioactive decay. A nuclear data library file of 1,063 isotopes provides nuclear parameters, neutron cross sections, and gamma photon production data for four reactor types: high-temperature, gas-cooled (HTGR), light water (LWR), liquid-metal fast-breeder (LMFBR), and molten-salt breeder (MSBR). Versatile options for blending and reprocessing of reactor fuel are included.CDC7600,6600,6400; FORTRAN IV (FTN4.6(439) FORTRAN compiler, optimization level 2); SCOPE 2.1.5; Approximately 104K (octal) words of SCM and 156K (octal) words of LCM are required for execution on a CDC7600.

0701 Physical Isotope Separation

19902 **(ANL/NESC—179) ISOTOPES; maximum yield from reaction or decay.** Furman, A. (Lockheed Missiles and Space Co., Sunnyvale, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048179.

The number of flux values used may range from 2 to a maximum of 100 for each individual reaction and decay problem.

This program can be used to calculate for any neutron flux the optimum time of irradiation for maximum yield, the specific activity of the product isotope in curies per gram of target material, and the combined specific activity of the target and product isotopes. The product isotope may be produced by any simple reaction such as (n,gamma), (n,p), (n,2n), etc., or it may be produced by decay of a parent isotope.UNIVAC1100; FORTRAN V; EXEC8; Less than 3600 words of memory were used in executing the sample problem.

19903 **(ANL/NESC—903) COLCO; thermal diffusion column coefficients.** Rutherford, W.M. (Monsanto Research Corp., Miamisburg, OH (USA). Mound). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048903.

Maxima of - 100 temperature points 100 omega integrals 50 entries in the gas property table 50 entries in the liquid property table.

COLCO calculates thermal diffusion column coefficients from theory. The program can be used for both liquid-phase and gas-phase thermal diffusion columns. Column coefficients for the gas-phase can be based on gas properties calculated from kinetics theory using tables of omega integrals or on tables of compiled physical properties as functions of temperature. Column coefficients for the liquid-phase can be based on compiled physical property tables.IBM360,303x;CDC6600,CYBER175; FORTRAN IV; OS/360 (IBM360), SCOPE 3.4, NOS/BE 1.3 (CDC6600); 70K bytes of memory are required for execution of the IBM360 version; 23,000 (octal) words of memory are required for the CDC6600 version.

19904 **(ANL/NESC—258) EXPN; analysis of pulsed neutron source data.** Peterson, C.L. (General Electric Co., San Jose, CA (USA). Nuclear Energy Div.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048258.

EXPN analyzes pulsed neutron data using the Garelis-Russel technique (reference 1). Basically the code computes the prompt decay constant, alpha, and the parameter (k*beta/l) from experimental data, which is directly extracted from a time analyzer storage memory and read onto a punched paper tape. The alpha-determination part of the code was originally obtained under the name EXPLICIT from Knolls Atomic Power Laboratory but has since been modified. The code provides options for a pre-burst or a post-burst background analysis. That is, the parameters alpha and (k*beta/l) are obtained using a background measured prior to the burst or measured after the burst.GE635; FORTRAN IV; GE635 GECOS; 35K machine with input and output media.

19905 **(ANL/NESC—367) ISOGEN; radionuclide generation and decay.** Tuyl, H.H.V. (Pacific Northwest Lab., Richland, WA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048367.

Maxima of - 30 time-steps involving either irradiation or decay 50 members in a single chain 500 nuclides in a single case.

ISOGEN calculates radioisotope generation and decay, using two-group neutron cross sections.UNIVAC1108; FORTRAN

V; EXEC2; 65K memory and one tape very helpful, but not essential.

19906 (SAND—82-2002C, pp 21-29) **Zetatron neutron generating tube revisited.** Shope, L.A. Jan 1983. NTIS, PC A08/MF A01.

From 2. prompt fussion neutron uranium logging seminar; Albuquerque, NM, USA (19 May 1981).

The predecessor of the Zetatron neutron generating tube came into being at the request of NASA for a small neutron source for use in activation analysis. The tube continued its life in a second version as a highly repeatable neutron source for calibrating neutron detectors and measuring neutron attenuation in materials. The most recent version has found application in uranium borehole logging, portal security monitoring, and transuranic assaying. Its physical size is 38 mm diameter with source magnet in placce by 126 mm long. It is operated in a pulse mode on both the ion source and the accelerating voltage. The tube utilizes the D-T reaction, accelerating a mixed beam from the ion source onto an occluded gas target, also of a D-T mixture. Details of the tube processing and the tube operation and characteristics follow.

19907 (SAND—82-2002C, pp 30-37) **Pulse neutron generator design update.** Thibideau, F.D. (General Electric Co., St. Petersburg, FL). Jan 1983. NTIS, PC A08/MF A01.

From 2. prompt fussion neutron uranium logging seminar; Albuquerque, NM, USA (19 May 1981).

This paper describes a neutron generator which was developed at the request of Sandia National Laboratories, Albuquerque, New Mexico, for use in the Sandia-developed uranium logging probe. The principal changes that have evolved since the earlier description include: diameter reduced from 603 mm (2.375 in) to 540 mm (2.125 in), neutron tube accelerator voltage increased from about 100 kV to about 125 kV, and controlatron neutron tube replaced by the Zetatron neutron tube (this added electron suppression). The changes were made to increase clearance when used in small diameter boreholes, increase operational life, and improve neutron output. Circuit and construction modifications which accomplished these changes are included in the text.

19908 (EUR—7010-EN) **Thermodynamic and engineering assessment of hybrid processes for the production of hydrogen with specific application to the Mark 13 process.** Joels, R.K. (Commission of the European Communities, Luxembourg). 1981. 120p. Available from Commission of the European Communities, Luxembourg.

A single hybrid process based upon the reaction of sulphur dioxide, bromine and water was first studied on a thermodynamic basis. A more detailed engineering analysis followed in which the various separation steps were defined and the heat recuperation possibilities investigated. After defining the nuclear reactor-chemical process link, a hydrogen production cost was then estimated. Finally, parametric analyses illustrated the effects of variations upon input data.

19909 (EUR—7115-DE) **Development of a method of preparing ZrO_2 (Y_2O_3) thin film electrolytes on porous supporting materials.** Dietrich, G.; Doenitz, W.; Hermeking, H.; Oehme, G.; Wahl, J. (Commission of the European Communities, Luxembourg). 1981. 84p. (In German). Available from Commission of the European Communities, Luxembourg.

The investigation aimed at the development of a process for preparation of thin films of yttrium-stabilized ZrO_2 electrolytes. Electrolyte losses can be dramatically reduced by reducing the electrolyte thickness in high-temperature electrolysis, and the flexibility of vapour electrolyses is increased. For example, low-temperature vapour can be used as feed vapour without lowering the process efficiency. In the process developed, thin ZrO_2/Y_2O_3 electrolyte films, which are not self-supported, are deposited on a porous supporting material. At the some time, suitable electrodes had to be developed as electrical contacts with the electrolyte.

19910 (EUR—7573-EN) **Novel oxides having high protonic conductivity as electrolyte for low temperature water vapour electrolysis.** (Commission of the European Communities, Luxembourg). 1981. 29p. Available from Commission of the European Communities, Luxembourg.

The following materials were examinated: γ-AlOOH, α-FeOOH, SbOOH, $H(H_2O)$sub(x) β''alumina. All the materials have been characterised by means of chemical analysis, X-rays, thermogravimetry, I-R spectroscopy and surface measurements. Furthermore the protonic conduction characteristic of the materials have been tested by means of E.M.F. and conductivity measurements.

19911 (EUR—7610-EN) **Gas bubble behaviour and ohmic potential drop during water electrolysis.** Sillen, C.W.M.; Janssen, L.J.J.; Geraets, J.; Goedkoop-Kooijman, A.G. (Commission of the European Communities, Luxembourg). 1981. 91p. Available from Commission of the European Communities, Luxembourg.

The aim of the hydrogen program of EG is minimization of energy losses during water electrolysis. This investigation contributes to the fundamentals for an advanced water electrolysis. The subjects of the present study are the following: the behaviour of bubbles at perforated electrodes pressed against diaphragms of different materials, the ohmic resistance of a layer of solution between diaphragm and working electrode and the bubble size and distribution in the solution leaving the electrolytic cell. When using an electrode with gaps in it pressed against a diaphragm, it is very important that the gaps remain free of gas bubbles. Whether or not the gaps are filled up by bubbles, depends on material of diaphragm and on the geometry of electrode. It has been found that the best electrode, in this respect, of the ones which have been investigated is the expanded metal gauze electrode. However, pressing this electrode type against the diaphragm, the latter is often damaged, since this electrode has gaps mostly with very sharp edges. For perforated plate electrodes it is observed that the round gaps are easily filled up with large bubbles, (very unfavourable), if a diaphragm of nafion, $K_2Ti_8O_{13}$/PTEE, Polysulfone or ZrOsub(x)/PTEE is used. Asbestos or PAM/PS-diaphragms act differently: no large bubble fill up the gaps.

19912 (EUR—7794-EN) **Properties and electron transfer reactivity of coordination compounds for the photochemical splitting of water.** Moggi, L. (Commission of the European Communities, Luxembourg). 1982. 49p. Available from Commission of the European Communities, Luxembourg.

Photochemical, photophysical, and electrochemical properties have been determined for the excited states of many polypyridine complexes of Cr(III), Ru(II), Os(II), Rh(III), and Ir(III), in relation with the use of these compounds in cyclic photochemical systems for the splitting of water. Some of the complexes were also tested in sacrificial systems for the production of H_2, but the results obtained are not satisfactory. Studies were also performed which gave an experimental support to theoretical methods of evaluating the redox properties of excited states and foreseeing the nature (energy of electron transfer) of bimolecular reactions of excited states. These methods involve calculations based on simple thermodynamic data. In the field of the identification of the electronic factors which may affect the rate of the electron transfer processes, we have only obtained preliminary results, which may serve as a basis for more extended and systematic researches.

19913 (EUR—7870-EN) **Design and construction of electrolyzers with solid electrolyte using Nafion membranes. Final report.** (Panclor S.p.A., Milan (Italy)). 1982. 56p. European Community Information Service, 2100 M Street, N.W., Suite 707, Washington, DC 20037.

A cell model was used to evaluate the advantages and perspectives offered by an electrolyzer based on a solid polymeric electrolyte such as Nafion. The 20-kW cell model was only run at a maximum pressure of 5 bar and a temperature of 120°C. The only adequate technique for the activation of the Nafion membrane consisted of a rather complex cycle, ending with the deposition of nickel under controlled reduction conditions. In order to remove cost limitations, a lithiated solid polymeric electrolyte was used instead of an acid system as used by General Electric. This allowed the use of conventional materials, as for the usual alkaline electrolysis. Current collectors have been selected in the form of nickel wire knit mesh type mats, pre-stressed in order to obtain a good elastic response. Applied pressures in the order of 1 kg/cm^2 gave resistivity values of about 0.1 Ω cm^2 in electrical current transfer. The cell fluidodynamics was fully investigated, and adequate equations were derived to describe the two-phase flow patterns inside the cell and in the piping providing natural circulation of the process liquid. A specific computer program was prepared and used in cell design. Structural materials have been adequately selected and tested. Two cell prototypes, having design pressures of 5.5 and 33 bar have been constructed. The first was tested in the frame of an adequate pilot plant, providing a mathematical model for cell voltage as function of the temperature and the current density. The collected results will be a basis for the design of a future 100-kW unit.

19914 **(N—8228788) Autothermal reforming of sulfur-free and sulfur-containing hydrocarbon liquids.** (Jet Propulsion Lab., Pasadena, CA (USA)). Oct 1981. 74p. NTIS, PC A07/MF A01.

The mechanisms by which various fuel component hydrocarbons related to both heavy petroleum and coal-derived liquids are converted to hydrogen without forming carbon were investigated. Reactive differences between paraffins and aromatics in autothermal reforming (ATR) were shown to be responsible for the observed fuel-specific carbon formation characteristics. The types of carbon formed in the reformer were identified by SEM and XRD analyses of catalyst samples and carbon deposits. From tests with both light and heavy paraffins and aromatics, it is concluded that high boiling point hydrocarbons and polynuclear aromatics enhance the propensity for carbon formation. The effects of propylene addition on the ATR performance of benzene are described. In ATR tests with mixtures of paraffins and aromatics, synergistic effects on conversion characteristics were identified. Indications that the sulfur content of the fuel may be the limiting factor for efficient ATR operation were found. The conversion and degradation effects of the sulfur additive (thiophene) were examined.

19915 **(PB—82-227612) Solar-assisted hydrogen generation by photoelectrocatalysis. Annual report mar 80-feb 81.** Ang, P.G.P.; Richardson, P.F.; Yen, P.H.; Tiller, A.J.; Rossignuolo, A.A. (Institute of Gas Technology, Chicago, IL (USA)). Mar 1982. 63p. NTIS, PC A04/MF A01.

Improved photoanodes were developed by surface modification of oxide semiconductor electrodes. Semiconductors evaluated were iron oxide, strontium titanate, and titanium dioxide.

19916 **(PB—82-231622) Photolysis of water for production of fuel gases. Annual report Jan-Dec 80.** Eror, N.G. (Oregon Graduate Center, Beaverton (USA)). Jan 1981. 346p. NTIS, PC A15/MF A01.

In order to make the photocatalytic decomposition of water an economically viable process for production of hydrogen or other fuel gases, progress needs to be made in the basic science, and the ability to use that science in technology. In order to develop semiconductor electrodes for the photolysis of water that have efficiencies greater than 10%, it will be necessary to move beyond the semiempirical method. The defect structure of pure as well as donor and acceptor doped strontium titanate (SrTiO3) was determined. Contrary to what was previously reported, SrTiO3 was found to be an excellent analog of barium titanate (BaTiO). The solubility of lanthanum is very high in SrTiO3 (40 at .%) and is self compensated at high oxygen activities (air). Various models were proposed to account for the wide range of point defects encountered in both intrinsic and extrinsic SrTiO3. Electrical conductivity measurements at both high and low temperatures; thermogravimetric studies; x-ray diffraction, photoconductivity, Raman spectroscopic, Seebeck and photoelectrochemical cell measurements at lower temperatures were used to characterize the point defects and their role in the photolysis of water.

19917 **(PB—82-231671) Basic research opportunities for lasting fuel gas supplies from inorganic resources. Final report 15 Feb 81-28 Feb 82.** (Texas Engineering Experiment Station, College Station (USA)). Feb 1982. 335p. NTIS, PC A15/MF A01.

Twenty-six participants (twenty-five faculty members from U.S. universities and one private consultant) reviewed the status of current research problems relating to the production of fuel gases from inorganic resources using indefinitely sustainable energy sources during a workshop held during the period June 8 to August 14, 1981 at Texas AandM University, College Station, Texas. Photobiological, biomimetic, photochemical, photoelectrochemical, radiolytic and thermochemical pathways leading to the generation of hydrogen from water and hydrogen sulfide, of carbon monoxide and methane from carbon dioxide, and of nitrogen-based fuel gases from atmospheric nitrogen were assessed. The most likely energy sources to drive the endergonic, fuel-producing reactions are solar radiation, and heat and radiation from nuclear reactors. Recommendations at the end of each chapter outline the basic research needed to improve the fuel gas-producing reactions and to provide the basis for developments leading to the practical application of these processes. It was suggested that equal emphasis should be placed on research in photobiology, biomimetic chemistry, photochemistry and photoelectrochemistry pertinent to fuel-gas production. Thermochemical and radiolytic methods appear to deserve less attention at the present time. The report contains 840 literature citations.

19918 **(PB—82-232786) Use of immobilized hydrogenase for hydrogen production- final report.** Durand, G.; Hatchikian, C.; LeGall, J.; Monsan, P. (Commission of the European Communities, Luxembourg). [nd]. 47p. NTIS, PC AE03/MF E03.

Hydrogen production at the rate of 0.1 liter hydrogen gas per minute per gram support has been achieved at 37C with an immobilized hydrogenase isolated from Desulfovibrio gigas. The ability of immobilized hydrogenase to evolve hydrogen when coupled to illuminated chloroplasts has been demonstrated, and work is in progress to optimize the method of coupling.

19919 **(SERI/CP—231-1873) Photo/biological hydrogen program progress reports.** (Solar Energy Research Inst., Golden, CO (USA)). Dec 1982. Contract AC02-77CH00178. 163p. (CONF-820676—). NTIS, PC A08/MF A01. Order Number DE83005811.

Individual progress reports are abstracted for inclusion in the Energy Data Base.

19920 (SERI/CP—231-1873, pp 5-17) **Oxygen-evolution patterns from oxygen-evolving photosystem II particles.** Seibert, M.; Lavore, J. (Solar Energy Research Inst., Golden, CO). Dec 1982. NTIS, PC A08/MF A01. Contract AC02-77CH00178.

From SERI biomass program principal investigators review meeting; Washington, DC, USA (23 Jun 1982).

Recent investigations of the oxygen-enzyme system (OES) or the algal/higher plant water-splitting apparatus are reported. This apparatus represents a neglected area of research on the oxidizing side of green plant photosynthesis. Procedures yielding Photosystem II (PSII) preparations containing an active, water-splitting enzyme have been reported. New patterns of oxygen evolution resulting from sequences of short, single-turnover flashes on three types of PSII-OES samples are reported. The results are, in general, consistent with the S-state model developed to explain O_2 evolution in algae and chloroplasts, but several anomalies have been observed.

19921 (SERI/CP—231-1873, pp 19-32) **Enhancement of H_2 production by photosynthetic bacteria.** Weaver, P.F.; Schlutz, J.S.; Maness, P.C. (Solar Energy Research Inst., Golden, CO). Dec 1982. NTIS, PC A08/MF A01.

From SERI biomass program principal investigators review meeting; Washington, DC, USA (23 Jun 1982).

Under appropriate conditions anaerobically in the dark several species of photosynthetic bacteria generate energy either by fermentation of sugars (and endogenous polysaccharide) or by the anaerobic oxidation of nonfermentable substrates coupled to the reduction of nitrate, nitrite, dimethylsulfoxide (DMSO), or trimethylamine oxide (TMAO). From molar growth yields and carbon balance determinations we can estimate that nitrate is about 89% as efficient as O_2 in generating electron transport linked phosphorylation. DMSO and TMAO are 33% to 41% as efficient as O_2. Since most strains exhibit nitrogen fixation under dark fermentative growth conditions, it can be calculated that about 4 ATP are expended for each electron pair transferred to nitrogenase. Hydrogen production occurs in the dark at rates of about 36 ml H_2 g dry wt^{-1} hr^{-1}. The rates are unaffected by ammonia, thereby indicating its source to be from hydrogenase under these conditions. The activity saturates at about 0.2 atm H_2 pressure. Rhodopseudomonas sphaeroides SCJ incubated in the light under nitrogen-limiting conditions is capable of producing self-generated gas pressures of at least 50 atm, attributable primarily to H_2. Ammonia-sensitive, H_2 photoproduction rates are 168 ml H_2 g dry wt^{-1} hr^{-1} in saturating light. With light intensities from 20 to 190 W/m^2, 4.8 to 5.7% of the incident radiant energy can be recovered as combustible energy of the H_2 produced. Hydrogen production rates are independent of substrate concentrations from about 1 to 70 mM. About 20 biomass substrates have been identified as potentially suitable as photoconversion substrates. These include thin stillage from alcohol distilleries, spent beers, and numerous fruit and vegetable processing wastes provided that they are previously fermented.

19922 (SERI/CP—231-1873, pp 33-41) **Studies on algal hydrogenase and hydrogen metabolism.** Lien, S. (Solar Energy Research Inst., Golden, CO). Dec 1982. NTIS, PC A08/MF A01.

From SERI biomass program principal investigators review meeting; Washington, DC, USA (23 Jun 1982).

The primary objective of this project is to obtain fundamental information on hydrogenase and the associated hydrogen producing and utlizing metabolisms in eukaryotic microalgae so that effective biochemical and/or genetic manipulative techniques can be devised to: (1) modify or decrease the O_2-sensitivity of the algal hydrogenase; and (2) to direct a larger fraction of photosynthetic reductants toward hydrogenase to ensure higher rate of H_2 production by algal cells. Some aspects of the major technical progress accomplished to date are summarized.

19923 (SERI/CP—231-1873, pp 43-58) **Study of hydrogen production by tropical marine photosynthetic bacteria for applied systems: the second year study.** Mitsui, A.; Matsunaga, T.; Kumazawa, S. (Univ. of Miami, FL). Dec 1982. NTIS, PC A08/MF A01.

From SERI biomass program principal investigators review meeting; Washington, DC, USA (23 Jun 1982).

The marine photosynthetic bacteria Miami PBE 2271, isolated from the surface of the sea grass Thalassia in the subtropical marine environment, was studied for hydrogen production. It was grown on molecular nitrogen as the sole source of nitrogen. High rates of hydrogen production were observed at seawater salinities. Hydrogen production was completely light dependent. Under optimum conditions, this strain produced hydrogen from malate at rates as high as 8 μ mole/mg protein/h. Carbohydrates and organic acids were used as substrates for hydrogen production. It was also shown that blue-green algal biomass could be utilized as a substrate for hydrogen production, after acid or alkaline digestion. Strain PBE 2271 was also immobilized on agarose-coated polyester films in order to enhance and stabilize hydrogen photoproduction. Filtered seawater was used as the suspending medium. Hydrogen production was observed over a wide range of salinities (5 to 100%). Inhibitory effects of oxygen and nitrogen on hydrogen production were substantially reduced by immobilization. In addition, storage stability and duration of hydrogen production were improved by immobilization. Rates as high as 180 μ moles of hydrogen/mg Chl./hr. were observed. Hydrogen production was observed over a 20-day period without any reduction of the rate. Apart from the study with PBE 2271, bioenergetic properties of hydrogenase in PBS 1071 were investigated. This Chromatium strain produces hydrogen at high rates (6 μ moles/mg protein/hr) via a nitrogenase-mediated reaction. Hydrogenase-mediated oxygen-dependent hydrogen uptake activity was also observed.

19924 (SERI/CP—231-1873, pp 59-72) **Photoproduction of H_2 from cellulose by an anaerobic bacterial coculture.** Odom, J.M.; Wall, J.D. (Univ. of Missouri, Columbia). Dec 1982. NTIS, PC A08/MF A01/.

From SERI biomass program principal investigators review meeting; Washington, DC, USA (23 Jun 1982).

The photosynthetic diazotroph, Rhodopseudomonas capsulata is a metabolically versatile microorganism. Although R. capsulata grows on cellobiose, the organism does not utilize cellulose. One approach to coupling cellulose utilization to the photoproduction of hydrogen was to establish a nutritionally simple, facultatively anaerobic coculture catalyzing a light dependent food chain from cellulose to molecular hydrogen. Cellulomonas sp. was chosen as the cellulolytic organism due to its facultatively anaerobic metabolism, simple nutrition and organic acid production during sugar fermentation without the evolution of gas. As a result of this choice, organic acids rather than sugars would function as the substrates for the phototroph and the fermentation would not be limited by the accumulation of hydrogen as has been observed in other organisms where hydrogen is a fermentation product. As the hydrogen producing organism, R. capsulata wild type, or a mutant lacking the uptake hydrogenase, was employed in the coculture. Cocultures of these microorganisms were shown to degrade cellulose and to produce either large amounts of hydrogen or cell protein depending on the ammonium concentration.

19925 (SERI/CP—231-1873, pp 73-82) **Biochemical genetics and regulation of hydrogenase in Escherichia coli and Anabaena variabilis.** Spiller, H.; Patel, P.; Shanmugam, K.T. (Univ. of Florida, Gainesville). Dec 1982. NTIS, PC A08/MF A01/.

From SERI biomass program principal investigators review meeting; Washington, DC, USA (23 Jun 1982).

The main aim of our work is to isolate mutants of blue-green alga, Anabaena variabilis that are defective in hydrogen uptake and also to maximize H_2 production by the organism by eliminating rate-limiting steps, if any, in H_2 production. As a first step towards this goal, we have attempted to understand the basic physiology of H_2 production by this organism. It is generally accepted that the heterocysts, the differentiated cells containing nitrogenase, also contain hydrogenase and this hydrogenase is responsible for the H_2 uptake. However, several reports exist in the literature pointing to the fact that the vegetative cells also contain a hydrogenase activity, and this hydrogenase activity is believed to be reversible. Although a reversible hydrogenase, capable of catalysing H_2 evolution from reduced methyl viologen has been detected in the vegetative cells of heterocystous blue-green algae this activity is generally very low. This low activity led Bothe and his coworkers to suggest that this H_2 evolution is actually catalysed by the H_2 uptake hydrogenase. One of the major questions we are attempting to answer at the present time is the presence and nature of two hydrogenases. Are there two distinct hydrogenase proteins and thus two genes coding for each hydrogenase separately or one hydrogenase which under different conditions produces different activities. Understanding this particular aspect would be of immense help in isolating mutants defective in hydrogenase and H_2 uptake and this requires a good understanding of the physiology and biochemistry of the hydrogenase in A. variabilis.

19926 (SERI/CP—231-1873, pp 99-122) **Biochemical approach to solar hydrogen production.** Olson, J.M.; Bernstein, J.D. (Brookhaven National Lab., Upton, NY). Dec 1982. NTIS, PC A08/MF A01/.

From SERI biomass program principal investigators review meeting; Washington, DC, USA (23 Jun 1982).

The research can be divided conveniently into four stages. In the present stage PS-I and PS-II vesicles have been made from natural sources (e.g. green photosynthetic bacteria, blue-green algae, and chloroplasts) and tested for the ability under appropriate conditions to produce either hydrogen or oxygen. In the second stage reaction centers and even entire photosynthetic units will be isolated from natural sources and incorporated in artificial vesicles. In the third stage the goal should be synthetic reaction centers and synthetic pigments in synthetic vesicles. Concurrent research and development of a synthetic barrier membrane will be required to satisfy the stringent requirements of a workable photohydrogen generator.

19927 **Effect of surface roughness on the hydrogen evolution reaction kinetics with mild steel and nickel cathodes.** Brown, A.P.; Krumpelt, M.; Loutfy, R.O.; Yao, N.P. (Argonne Natl Lab, IL, USA). *Electrochimica Acta;* 27: No. 5, 557-560(May 1982).

The effect of electrode surface roughness on the kinetics of the hydrogen evolution reaction has been studied for mild steel and nickel cathodes in 10 M NaOH at 348/degree/K. With the nickel cathodes, the Tafel slope was independent of whether the electrode surface was smooth or roughened, but the exchange current density was about twice that for the roughened electrode. With the mild steel cathodes, the roughened electrode showed a considerably lower Tafel slope than the smooth electrode with b?51 mV for the rough electrode and b?110 mV for the smooth one. The exchange current density was also lower for the roughened mild steel cathode than for the smooth electrode: 1.0*10/sup -5/ A/cm/sup 2/ vs 2.3*10/sup -5/ A/cm/sup 2/. 20 refs.

19928 **Investigation of the potential of polymer-bound coordination compounds as catalysts for the photolytic production of hydrogen from water.** Kelly, J.M.; Clear, J.M.; Grayson, D.H.; Johnston, D.S.; Pepper, D.C.; Vos, J.G. Luxembourg; Commission of the European Communities (1981). 54p. (EUR—7593-EN). .

Organic polymers containing polymer-bound complexes of the type $[Ru(bpy)_2(PVP)X]$sup(n+) (n = 1, X = Cl; n = 2, X = CO, py, H_2O, PVP) have been prepared. Synthetic routes proceed either from preformed polymer and $Ru(bpy)_2Cl_2$ or $[Ru(bpy)_2(OH_2)_2]^{2+}$ or via polymerisation of the corresponding monomer complex. The dependence of the chemical and physical properties on the nature of the polymer backbone and on the loading of the metal complex on the polymer (the Ru:PVP) ratio has been studied.

19931 **(EUR—7980-EN) Energy LP modelling prospects for NDF hydrogen. Final report.** Clifford, J.S.; Laughton, M.A.; McRoberts, T.S.; Slee, P.V. (Queen Mary Coll. Industrial Research Ltd., London (UK)). 1982. 98p. European Community Information Service, 2100 M Street NW, Suite 707, Washington, DC 20037.

An 8-nation, 5-period model constructed to investigate the potential role of Non-Fossil-Derived Hydrogen (NFDH) processes in the future of the European Community energy supply, showed: significant rise in imported coal use; the depletion to zero of all indigenous oil and gas reserves; the phasing out of imported oil and gas by means of cheaper oil and gas derived from coal conversion in the latter decades of the period studied; penetration of market is insensitive to projected oil prices; the competition of relative costs of nuclear electricity and coal; critical electricity-to-coal price ratio boundaries separating out the three regions for NFDH operation; and interdependence between electricity generation and coal conversion wheree the latter depends on nuclear electricity being available at marginal cost. Joint ventures between disparate industries such as the coal and lectricity industries may create institutional and accountancy problems.

The research program is divided into two parts: selective conversion of two CO ligands on Cp $Fe(CO)_3^+$ to C_2 organic compounds, and bimetallic activation of coordinated ligands. (DLC)

19933 **(DOE/PC/30021—T11) Catalyst and reactor development for a liquid-phase Fischer-Tropsch process. Quarterly technical progress report, 1 July 1982-30 September 1982.** Dyer, P.N.; Pierantozzi, R.; Brian, B.W.; Bauer, J.V.; Parsons, R.L. (Air Products and Chemicals, Inc., Allentown, PA (USA)). Nov 1982. Contract AC22-80PC30021. 36p. NTIS, PC A03/MF A01. Order Number DE83005595.

Two major tasks were current in the eighth quarter: (1) Slurry Catalyst Development; and (2) Slurry Reactor Design Studies. Parametric gas phase screening of supported conventional catalysts continued, enabling the optimum for diesel range product to be chosen for slurry testing. Seven supported molecular clusters were tested in the slurry phase. One gave results similar to a previous screening test; a high 1-alkene content and small Schulz-Flory deviations in the $C_{10}+$ range, but with a cut off at ~ C_{28}. The slurry test of another cluster catalyst showed a high bulk activity, with conversion levels four times higher than the baseline catalyst, and deviations from the Schulz-Flory limitation that increased with time. Up to 55.1 wt % C_{10}-C_{20} was produced with a low 5.7 wt % CH_4 yield. The results demonstrate potential for a good diesel fuel catalyst. Shakedown runs and initial gas holdup determinations were completed for the 12" column, and a statistical experimental design was produced to maximize the information gained from this program. The use of a hot-film anemometer probe to measure bubble diameter in the three phase systems was successfully demonstrated, and programing to interpret the data was begun. Viscosity measurements for hydrocarbon slurries showed non-Newtonian behavior, and are expected to result in a significant correlation parameter. 10 figures, 4 tables.

19934 (DOE/PC/40276—T1) Spray combustion of synthetic fuels. Phase II. Spray-combustion phenomena. First quarterly report, 1 October 1981-1 January 1982. (Science Applications, Inc., Chatsworth, CA (USA). Combustion Science and Advanced Technology Dept.). 28 Jan 1982. Contract AC22-81PC40276. 150p. NTIS, PC A07/MF A01. Order Number DE82010209.

The objectives of this project are to augment existing information on physical and chemical processes relevant to synfuel combustion; to develop fundamental information and data bases applicable to synfuel utilization in industrial combustors; and to develop associated combustion models and synfuel utilization criteria with special emphasis on spray combustion. During the first quarter of the program progress in each of the active tasks includes work performed on Tasks 1, 2.1, 3, 4.1 and 5. Work on Task 1 was devoted to the identification ad collection of available synfuel properties relevant to spray combustion phenomena. Emphasis was on the physical and chemical properties of SRC-II middle and heavy distillates and the baseline No. 2 fuel oil. Effort on Task 2.1 was devoted to the delineation of required extensions of the existing quasiglobal kinetics models for application to the analysis of the oxidation process of Baseline No. 2 fuel oil and SRC-II middle distillate. In addition, sources of data relevant to the implementation of these extensions have been identified. Work on Task 3.1 emphasized both the formulation and the initiation of the development of the submodel elements needed for analysis of experimental data and spray combustion predictions. These model developments include: (1) laminar flat flame analysis; and combustion models; (4) spray trajectory model. Work under task 3.2 emphasized the submodel development for the dense spray processes relevant to the near field of the spray injection process. Task 4.1 was devoted to the design of the cold flow hardware to be used for flowfield and spray dynamics characterization. Work under Task 5 was on the development of the overall modular spray combustion model including the formulation and application of supporting analysis.

19935 (N—8228485) Fire extinguishing tests -80 with methyl alcohol gasoline. Holmstedt, G.; Ryderman, A.; Carlsson, B.; Lennmalm, B. (Statens Provningsanstalt, Boraes (Sweden)). 1980. 121p. (MIXED). (SP-RAPP—1981:20). NTIS, PC A06/MF A01.

Large scale tests and laboratory experiments were carried out for estimating the extinguishing effectiveness of three alcohol resistant aqueous film forming foams (AFFF), two alcohol resistant fluoroprotein foams and two detergent foams in various poolfires: gasoline, isopropyl alcohol, acetone, methyl-ethyl ketone, methyl alcohol and M15 (a gasoline, methyl alcohol, isobutene mixture). The scaling down of large scale tests for developing a reliable laboratory method was especially examined. The tests were performed with semidirect foam application, in pools of 50, 11, 4, 0.6, and 0.25 sq m. Burning time, temperature distribution in the liquid, and thermal radiation were determined. An M15 fire can be extinguished with a detergent foam, but it is impossible to extinguish fires in polar solvents, such as methyl alcohol, acetone, and isopropyl alcohol with detergent foams, AFFF give the best results, and performances with small pools can hardly be correlated with results from large scale fires.

19936 (PB—83-111088) Gobar gas plant - a study. Mukherjee, K.K. (Gandhi Peace Foundation, New Delhi (India)). May 1974. 23p. NTIS, PC A02/MF A01.

The Gobar Gas Plant has drawn the attention of the government and the people in the context of the countrywide scarcity of fuel and manure. The gas plants of the Sevapuri block, Varanasi, U.P., have been taken into consideration for the purposes of the study. This study was undertaken with a view to knowing the working and functioning of the gas plants in respect of their size, cattle requirement, maintenance, gas formation and consumption, seasonal variation in gas formation, benefits, cost benefit ratio and their problems, and also to know the owners - their socio-economic background, acceptance, and motivation. The importance of the study is that it will help both the government and the people to know in detail the working and functioning of the gas plants and their respective owners.

19937 (SERI/CP—230-1797) Fuel-gas production from animal and agricultural residues and biomass. Anaerobic Digestion Program. (Solar Energy Research Inst., Golden, CO (USA)). Dec 1982. Contract AC02-77CH00178. 132p. (CONF-820676—Vol.2). NTIS, PC A07/MF A01. Order Number DE83005106.

From SERI biomass program principal investigators review meeting; Washington, DC, USA (23 Jun 1982).

The papers presented at this conference dealt with the genetics and metabolic requirements and processes of methanogenic bacteria; the autohydrolysis of cellulose as a pretreatment to increase biodegradability to methane; biochemical reaction kinetics of anaerobic digestion; the economics of biomass conversion plants; and the use of methane in the cogeneration of electricity and hot water. Separate abstracts were prepared for the seven papers presented at the conference. (CKK)

19938 (SERI/CP—230-1797, pp 53-65) **Autohydrolysis of organic residue to increase biodegradability to methane.** McCarty, P.L.; Young, L.Y.; Colberg, P.J.; Baugh, K.; Bachmann, A.; Beard, V.; Heim, D. (Stanford Univ., CA). Dec 1982. NTIS, PC A07/MF A01.

From SERI biomass program principal investigators review meeting; Washington, DC, USA (23 Jun 1982).

The objective of this study is to evaluate thermochemical pretreatment as a method for increasing the anaerobic biodegradability of organic materials so that they can be more completely fermented to methane gas. The study has five phases: semi-continuous autohydrolysis system operation; autohydrolysis process optimization; anaerobic treatment optimization; autohydrolysis of agricultural residues; and biodegradation of lignin and lignin fractions. The system being constructed under phase one, involving the autohydrolysis of softwood and the fermentation of the resulting soluble product to methane, will treat about six liters/day of autohydrolysis liquid. The work under phase two has been to determine treatment conditions that maximize solubilization of forest product carbohydrates while minimizing their decomposition to refractory compounds. A high performance liquid chromatography system is described which quantifies the products formed during autohydrolysis. Under phase three digesters were evaluated and a new reactor was developed. Previous studies have shown that autohydrolysis of agricultural residue tends to make them less biodegradable because a portion of the material is made refractory. Under phase four autohydrolysis will be applied to the lignocellulosic residue remaining after initial anaerobic digestion of agricultural materials. Preliminary results have been previously reported; the studies have been extended; but no new results are available. Phase five studies are nearly complete on the biodegradation of lignin, and results will be reported in the next progress report. (CKK)

19939 (SERI/CP—230-1797, pp 67-87) **Biochemical studies on the metabolic requirements of methanogenic bacteria and fatty acid utilizers as an approach to increasing the rate and yield of methanogenesis.** LeGall, J.; Ljungdahl, P.O. (Univ. of Georgia, Athens). Dec 1982. NTIS, PC A07/MF A01.

From SERI biomass program principal investigators review meeting; Washington, DC, USA (23 Jun 1982).

The fermentation of cellulose to methane is a complex anaerobic process involving a number of different physiological types of microorganisms. Using sulfate reducing and methanogenic bacteria as a model it is possible to describe the regulatory mechanisms involved on a molecular basis during both the oxidation of organic acids (produced from the breakdown of large polymers, e.g. cellulose) to molecular hydrogen and the reduction of carbon dioxide to methane by hydrogen. It is clear that a thorough understanding of the structure and function of redox proteins associated with these types of organisms is necessary when optimizing the rate and yield of methane production within digestors. The studies of redox proteins have pointed out the importance of certain nutrients in the metabolism of both organic acid oxidizing and methanogenic bacteria. Results are reported on the role played by cobalt, nickel, sulfur, and inorganic pyrophosphate in the conversion of biomass to methane. The direction of future studies is described.

19940 (SERI/CP—230-1797, pp 89-103) **Continuous culture biomass fermentation studies. Quarterly report.** Gaddy, J.L.; Clausen, E.C. (Univ. of Arkansas, Fayetteville). Dec 1982. NTIS, PC A07/MF A01.

From SERI biomass program principal investigators review meeting; Washington, DC, USA (23 Jun 1982).

Anaerobic digestion can be carried out in either batch or continuous culture reactors. The batch reactor is best suited to the smaller farm-scale system, since it requires less attention and offers less opportunity for exposure to oxygen. Most large-scale chemical processes use continuous reactors, primarily because of a lower labor requirement, smaller equipment, or better quality control. Continuous reactors offer additional advantages in anaerobic digestion. A constant gas output can be achieved, and better kinetics and smaller reactors usually result. Problems with maintaining viable cultures are reduced since frequent start-up is not required. The purpose of this study is to investigate ways of improving the kinetics of producing methane by anaerobic digestion of agricultural residues in continuous culture. The current status of anaerobic digestion kinetic measurements and reactor design are analyzed. Utilizing the kinetic model, a preliminary process design and economic analysis is presented for the industrial process and parameters affecting the economics of methane production are discussed.

19941 (SERI/CP—230-1797, pp 105-111) **Anaerobic fermentation of beef-cattle manure and crop residues.** Hashimoto, A.G.; Hruska, R.L. (Agriculture Research Service, Clay Center, NE). Dec 1982. NTIS, PC A07/MF A01.

From SERI biomass program principal investigators review meeting; Washington, DC, USA (23 Jun 1982).

The overall objective of this study is to assess the technical and economic feasibility of producing methane through anaerobic digestion of manure and crop residue mixtures and to develop optimum systems compatible with livestock production enterprises. This paper summarizes the results of the two year study using both laboratory scale and pilot plant scale fermentors. Evaluated were the following: a pilot-scale two-stage fermentation system designed to accommodate manure-straw mixtures; the effect of mixing a highly carbonaceous substrate (molasses) with a highly nitrogenous substrate (cattle manure) on CH_4 production; the effects of temperature, pH, substrate concentration, and alkaline pretreatment on the rate and extent of hydrolysis of manure-straw mixtures; the effect of temperature and concentration of straw in manure-straw mixtures on CH_4 production; the effect of mixing duration and vacuum on CH_4 production rates; and the effects of temperature, volatile solid concentration, and hydraulic retention time on CH_4 production. (CKK)

19942 (SERI/CP—230-1797, pp 113-116) **Low cost approach to methane generation, storage and utilization from crop and animal residues. Informal progress report, January 1, 1982-June 30, 1982.** Jewell, W.J. (Cornell Univ., Ithaca, NY). Dec 1982. NTIS, PC A07/MF A01.

From SERI biomass program principal investigators review meeting; Washington, DC, USA (23 Jun 1982).

This paper describes the objectives, status, and future activities of a project for the development of dry fermentation for crop residue methane production and for the operation of two full scale dairy fermentors emphasizing alternative methods of biogas handling, storage, and cogeneration of electricity and hot water. (CKK)

19943 **Sulfur deactivation of nickel methanation catalysts.** Fitzharris, W.D.; Katzer, J.R.; Manogue, W.H. (Univ. of Delaware, Newark). *Journal of Catalysis;* 76: No. 2, 369-384(Aug 1982).

Sulfur deactivation of supported Ni in CO hydrogenation was studied in an all-quartz internal-recycle reactor with a feed containing 4% CO in H_2. Thirteen ppB H_2S reduced the steady-state methanation activity of $Ni/\gamma\text{-}Al_2O_3$ about 200-fold at 661 K; 100 ppB H_2S reduced the activity 5000-fold. A dual site Langmuir-Hinshelwood rate expression predicts both the CO partial pressure dependence and the S poisoning. Poisoning and chemisorption data indicate formation of a stable two-dimensional surface sulfide with a S:Ni surface atom ratio of 1:2 for 13 ppB H_2S in H_2 at 661 K. The surface sulfide has a free energy of formation of at least -26 kcal/mole which is 15 kcal/mole more stable than bulk Ni_3S_2. Sulfur poisoning is due to geometric effects, i.e., site blockage, rather than electronic effects since the activation energy for methanation over S-poisoned Ni was the same as that over unpoisoned Ni, 24 kcal/mole.

19944 **Conversion of tannery waste to useful products.** Muralidhara, H.S.; Maggin, B.; Phipps, H. (Battelle, Columbus, OH 43201, USA; Arthur D Little, Inc, Washington, DC 20006, USA; Economics and Energy Resources, Inc, Washington DC 20012, USA). *Resources and Conservation;* 8: No. 1, 43-59(Mar 1982).

The purpose of this study was to evaluate the technical performance and cost effectiveness of a low temperature pyrolysis process which uses dry leather tanning wastes to provide energy and chrome tanning liquor for reuse in tanneries. Presently, leather waste is disposed of in landfills, resulting not only in a considerable loss of potential energy (estimated to be 633 TJ annually), but an even more significant loss of chromium (estimated to be 8.2 Gg annually). The pyrolysis process is shown to be technically feasible, economically viable, and can alleviate a leather waste management problem that is becoming increasingly more difficult to handle because of more stringent environmental chrome waste disposal requirements. Tanneries can save an estimated $7 million to $8 million annually by employing this pyrolysis process to conserve energy and chrome in dry tanning wastes. (Refs. 10).

19945 **(AD-A—120109/4) Assessment/review of methanol technology and utilization as a fuel. Interim report Oct 81-Sep 82.** Lee, G.H.; Stavinoha, L.L.; Zoschak, R.G. (Southwest Research Inst., San Antonio, TX (USA). Army Fuels and Lubricants Research Lab.). Jul 1982. 78p. NTIS, PC A05/MF A01.

Alcohols, in particular methanol and ethanol, are currently being extensively studied for feasibility of use as neat fuels, fuel extenders, and/or octane improvers. This report provides a review of methanol technology and a preliminary assessment of its potential for use as a mobility/stationary equipment fuel. A high degree of technical feasibility has been indicated for both increased methanol production and use as a fuel, principally in burners, turbines, and spark ignition engines. Generally, the methanol fuel of choice for direct utilization is not neat methanol, but a methanol fuel containing materials such as isopentane or gasoline (up to 10 vol%) to improve cold start, volatility, and other fuel properties. Modifications of existing equipment are generally needed for direct use of fuel grade methanol except in fuel cells. Use of methanol at low concentrations as an additive or gasoline extender presents fewer problems of system corrosion and elastomer compatibility. A program to demonstrate the potential for utilization of methanol (both direct and as an extender) in DOD equipment has been recommended. Under this program, the Army would evaluate the equipment performance in various climates, test the equipment reliability/durability, and resolve related support questions on the safe and efficient storage, distribution, and use of methanol fuel.

19946 **(AD-A—120160/7) Evaluation of plasma jet ignition for improved performance of alternate fuels. Final report Feb-Aug 82.** Grant, J.F.; Golenko, Z.; McIlwain, M.E. (Geo-Centers, Inc., Newton Upper Falls, MA (USA)). Aug 1982. 87p. NTIS, PC A05/MF A01.

Alcohols, such as ethanol and methanol, are potential substitutes for gasoline during periods of fuel shortages. The pure alcohols have been reported to cause performance and starting problems when used to fuel internal combustion engines. This study characterized how three modes of ignition, OEM-magneto, high energy conventional spark (CI) and plasma jet ignition (PJI) influenced the engine combustion properties of ethanol, methanol and gasoline-alcohol blends. Specific combustion properties examined in these measurements were burning velocity and lean limit. In addition, the engine performance was determined for 30% alcohol-gasoline containing blends. These engine performance measurements determined brake power, blake specific fuel consumption and brake emissions of carbon monoxide and hydrocarbons. The findings of this study suggest that high energy ignition systems, such as plasma jet ignition, will improve both fuel combustion properties and engine performance.

19947 (DOE/PC/30019—T4) **Liquid-phase-methanol process-development unit: installation, operation, and support studies. Technical progress report No. 5, 1 October 1982-31 December 1982.** (Chem Systems, Inc., Tarrytown, NY (USA)). 20 Jan 1983. Contract AC22-81PC30019. 345p. NTIS, PC A15/MF A01. Order Number DE83005491.

This report covers the fifth period of Contract performance. The overall objective of this program is to demonstrate the technical feasibility of the Liquid Phase Methanol (LPMeOH) process at theProcess Development Unit (PDU) scale of operation. Revision 2 of the LaPorte LPMeOH Process Development Unit (PDU) Engineering Flowsheet was released, incorporating advances made in the engineering design. The APCI Hazards Review team continued assessing risks associated with various process systems, particularly the reactor slurry loop. Process specifications were issued for an iron carbonyl removal system on the basis of a survey of industrial experience and literature related to the subject. The design for a flare system was developed APCI prepared an outline of catalyst reduction procdures, and data was accumulated on properties of circulating oils and slurry. A literature search was completed by CSI for the major topics of interest to the program. In CSI's laboratory, successful testing of in-situ catalyst reduction procedures continued in the CSI Stirred Autoclave Reactors, and two additional commercial catalysts were screened. The Laboratory PDU modifications continue on schedule. Further anlaysis of the 540-hour liquid-fluidized run in the CSI Laboratory PDU was completed. To assist in fundamantal modeling studies, an experimental program to generate bed expansion and gas holdup data in the CSI liquid-fluidized PDU reactor was completed. APCI reviewed chemical equilibrium correlations for the methanol synthesis reaction verified the validity of literature correlations at LPMeOH reaction conditions. The APCI backflow cell reactor computer model, to aid in scale-up of reactor design, was completed and the Continuous stirred Tank Reactor (CSTR) analysis and simulation program was used for determination of kinetics for the LPMeOH process.

19948 (DOE/RA/50362—1395-Vol.1) **Dunn-Nokota Methanol project, Dunn County, North Dakota. Volume I. Executive summary.** (Nokota Co., Bismarck, ND (USA)). 1982. Contract FG01-81RA50362. 178p. NTIS, PC A09/MF A01. Order Number DE83008564.

The Dunn-Nokota Methanol Project is a mine-mouth, coal-to-methanol complex proposed by The Nokota Company for construction and operation in west-central North Dakota in the Fort Union Coal Region at Dunn County, North Dakota. The Project would produce 86,940 barrels per stream day (BPSD) of methanol from 43,156 net short tons per stream day (ST/SD) of run-of-mine (ROM) lignite coal and have an annual capacity of 29.6 million barrels (1.24 billion gallons) of methanol and 14.7 million tons of ROM coal, based on a 93% onstream factor (340 stream days per year). The objectives of the feasibility studies (together with the parallel activities conducted by Nokota) were to produce data and analyses in sufficient detail to support a determination to proceed to final design, financing, and actual construction of the Project. In meeting this goal, the feasibility studies were designed to provide comprehensive data on the Project's technical, economic, regulatory, and marketing feasibility, as well as available financing and product transportation alternatives; and to identify and consider the significant environmental, health, socioeconomic, and safety concerns arising from construction and operation of the Project. The results of the DOE feasibility studies for the Dunn-Nokota Methanol project are contained in an eight-volume Final Report. This report is a compilation of the summaries contained in each of the other volumes of the Final Report.

19949 (DOE/RA/50362—1395-Vol.4) **Dunn-Nokota Methanol Project, Dunn County, North Dakota. Volume IV. Product transportation analysis.** (Williams Bros. Engineering Co., Tulsa, OK (USA); Purvin and Gertz, Inc., Dallas, TX (USA)). 1982. Contract FG01-81RA50362. 176p. NTIS, PC A09/MF A01. Order Number DE83008568.

The objective of this portion of the study was to evaluate the technical feasibility of transportation of methanol and by-products to predefined marketing areas by various modes of transportation including pipeline, rail, truck, and water. The study included a review of codes, standards and regulations; product characteristics in relation to transportation, tentative corridor route selections, permitting requirements, use of existing transportation systems, preliminary engineering costs for the pipeline section and transportation costs for available common carrier modes. The market areas considered in this part of the study were established in the Market Analysis Study (Volume III). The primary market area includes North Dakota, South Dakota, Minnesota, Iowa, Wisconsin, Illinois, Indiana, and Michigan. The secondary market area includes Montana, Wyoming, Colorado, Nebraska, Missouri, and Ohio. The West Coast market area consists of California, Oregon, and Washington. The study included investigation of use of existing pipeline systems and tentative selection of routings for eleven system alternatives, in corridors adjacent to existing or proposed pipelines. The eleven alternative pipeline routes are identified in Table 2-1 and include new dedicated systems and use of existing systems by batching. A generalized map showing the geographic relationship of the alternative routes is shown in Figure 2-1 and Figure 2-2 indicates possible terminal locations for the Minneapolis and Chicago areas.

19950 **(PB—82-237041) Source test and evaluation report: alcohol facility for gasohol production. Final reportoct 78-feb 80.** Scarberry, R.M.; Papai, M.P.; Mills, P.E.; Powers, T.J. III. (Radian Corp., McLean, VA (USA)). Apr 1982. 199p. NTIS, PC A09/MF A01.

This study defines the requirements for environmental sampling and analysis of alcohol-producing facilities capable of supporting a Gasohol industry and applies these requirements to the environmental characterization of an alcohol plant. This document includes a conceptual design of a grain alcohol plant using a coal-fired boiler that is projected to be typical of future plants which will support a Gasohol industry. Environmental control options are also discussed based on a comparison of alcohol plant stream compositions with environmental regulations. The results of this study provide preliminary information on the environmental consequences of large-scale fermentation ethanol plants which will provide alcohol for Gasohol.

19951 **(PB—83-118323) Economic balances of small scale ethanol from biomass operations.** Herendeen, R.A.; Reidenbach, D. (Illinois Univ., Urbana (USA). Dept. of Agricultural Economics). Jul 1982. 72p. NTIS, PC A04/MF A01.

The study analyzed the economic viability and operational and marketing conditions of three Midwestern grain-based fuel ethanol plants with production capacity of less than 1.5 million gallons per year. Results on capital costs, operational experiences, and marketing of fuel ethanol and feed byproducts are presented. These plants were found to have many similar characteristics, including low initial capital costs. However, additional capital requirements for the installation of ethanol dehydration equipment presented substantial cash flow problems. Most fuel ethanol plants studied were operating at less than production capacity due to unstable market conditions. The economic feasibility of the grain-based ethanol plants studied was determined to be marginal.

19952 **Alcohol-based fuels from syngases.** Greene, M.I. (Chem Syst Inc, Fairfield, NJ, USA). *Chemical Engineering Progress;* **78**: No. 8, 46-51(Aug 1982).

This paper summarizes results of a research program which was undertaken to find the most advantageous method of using methanol in gasoline blends. It is demonstrated that a mixture called methanol and C_2C_6 saturated alcohols, called Alkanol fuel, has the potential for providing a gasoline-blending stock superior to that of straight-run methanol or ethanol. Extensive property data and test results are tabulated, plotted, and discussed. Economic considerations are included. 4 refs.

19953 **Design for a small-scale fuel alcohol plant.** Berglund, G.R.; Richardson, J.G. (EG and G, Idaho Falls, Idaho, USA). *Chemical Engineering Progress;* **78**: No. 8, 60-67(Aug 1982).

The paper describes the small-scale fuel alcohol plant (SSFAT) which was designed as a small-scale chemical processing plant. The DOE publication, Fuel from Farms, set forth the basic design requirements. To lower operating costs, it was important that all the processes required to produce alcohol were integrated. Automated control was also an important consideration in the design to reduce the number of operators and operator time, thus reducing operating costs. Automated control also provides better quality control of the final product. The plant is presently operating in a test mode to evaluate operating characteristics. The discussion covers the following topics - design requirements; plan operations; fermentation; distillation; microprocessor control; automatic control; operating experience. 1 ref.

0904 Solid Waste And Wood Fuels

19954 **(AD-A—119065/1) Investigation of engineering and design considerations in selecting conveyors for densified refuse-derived fuel (drdf) and drdf: coal mixtures. Final report Jun 80-Sep 81.** Kahn, Z.; Renard, M.L.; Campbell, J. (National Center for Resource Recovery, Inc., Washington, DC (USA)). Aug 1981. 129p. NTIS, PC A07/MF A01.

An engineering evaluation and experimental program involving several types of conveyors applied to blends of densified refuse-derived fuel (dRDF) and blends of dRDF and coal, was conducted by the National Center for Resource Recovery. The final project report discusses the properties of waste affecting convey ability and presents experimentally determined values or observed characteristics. A procedure was selected for the assessment, selection, and operation of belt conveyors based on spillage rate. Corroborating experimental results from a recirculating test rig operated with samples of dRDF and a blend of dRDF and coal over a range of belt configurations, velocities and flow rates were also presented. Experiments conducted on a vibrating pan conveyor over a range of frequencies and stroke length, and on a small apron conveyor, were described and the test results analyzed.

19955 **(AD-A—120113/6) A wood and bark fuel economics computer program (FEP). Forest service research paper.** Harpole, G.B.; Ince, P.J.; Tschernitz, J.L.; Bilek, E. (Forest Products Lab., Madison, WI (USA)). Sep 1982. 14p. NTIS, PC A02/MF A01.

Forest products harvesting and manufacturing processes are expected to provide large and continuing supplies of wood and bark residues. At the same time, the demand for wood residue-type materials for production of wood-fiber based products as well as wood and bark fuels is expected to create competing utilization alternatives. Primary objectives of the fuel economics computer program (FEP) presented here are: (1) to provide a means for assessing the relative energy values of fossil fuels and wood/bark fuels, and (2) to provide pre-engineering assessments of the potential investment that may be justified by benefits gained through modification of systems to burn wood/bark fuels. The FEP computer program utilizes readily available fuel and economics information, standard combustion equations, and discounted cash flow analytic techniques. Because the FEP program is designed for preliminary assessments of wood/bark fuel use opportunities it is suggested that more advanced engineering and financial analytic methods be used for further evaluation whenever favorable venture likelihoods are indicated by the FEP program.

19956 **(DDS—033) Technology and economics of close-coupled gasifiers for retrofitting gas/oil combustion units to biomass feedstock.** Reed, T.B.; Jantzen, D.E.; Corcoran, W.P.; Witholder, R.E. (Solar Energy Research Inst., Golden, CO (USA)). [nd]. 16p. Solar Energy Research Inst., Golden, CO.

From First World Energy Congress, React '78; Atlanta, GA, USA (31 Oct 1978).

Close-coupled air gasifiers can be used to convert existing gas/oil boilers to burn biomass. The gasifiers are relatively simple units operating at 85%-90% thermal efficiency. The gas contains CO, H_2, hydrocarbon gases and vapors with N_2, H_2O, and CO_2 dilutants, and has a heating value of 140-200 Btu/scf when burned hot without scrubbing. Use of this gas in existing boilers may cause 5%-10% derating. Recent tests of a 14 MBtu/hour gasifier coupled to a power boiler in California over a 158 hour period gave satisfactory results with low emissions and only minor technical difficulties. The economics of two gasifiers reported in the literature are analyzed with respect to fuel cost, as a function of capital and operating costs. The gas is estimated to cost $1.40-$2.70/MBtu for biomass feedstocks costing $10-$20/dry ton. The capital costs of retrofitting existing gas/oil boilers are approximately two-thirds the cost of new installations of package wood-fired boilers. Although gasifiers larger than 100 MBtu/hour are not now available, they could probably be used to convert larger field-erected boilers to biomass more economically than construction of new wood-fired boilers. The cost of construction of a new wood-fired package boiler is estimated to be about the same as the cost of a gasifier plus a conventional gas/oil package boiler.

19957 **(PB—82-217621) Regional analysis of potential energy production from agricultural wastes: a technical and economic study. Final report.** Have, H. (Commission of the European Communities, Luxembourg). [nd]. 164p. (EUR—7537-EN). NTIS PC E07/MF E07.

A technical analysis of the possibilities of utilizing agricultural wastes for energy production indicates that direct combustion is the most favorable conversion method for straw and wood, while biological conversion at present is best suited for animal waste. An economic analysis was made, based on cost of collection, storage, transport and conversion of wastes and cost of corresponding oil and oil conversion.

19958 **Overview of R and D programs being coordinated by the inter-governmental wood combustion research group. Paper 81.8.3.** Osborne, M.C. (US EPA, Research Triangle Park, NC, USA). *Proceedings, Annual Meeting, Air Pollution Control Association;* vp(1981). (CONF-810631—).

From 74. annual meeting of the Air Pollution Control Association; Philadelphia, PA, USA (21 Jun 1981).

A study on the emissions from residential wood combustion was conducted. It was found that high concentrations of carbon monoxide and particulate are found in wood smoke but also concluded that socalled polycyclic organic matter (POM) is a more hazardous pollutant which is released from airtight wood stoves. A survey of programs for research of the hazards from air pollutants is given. 6 refs.

1301 Resources And Availability

19959 **(AD-A—120049/2) Wynoochee Hydropower/Fish Hatchery: feasibility report and environmental impact statement. Final report.** Waller, J.O. (Corps of Engineers, Seattle, WA (USA). Seattle District). 30 Sep 1982. 574p. NTIS, PC A24/MF A01.

The results of a feasibility study on the desirability of developing the hydropower potential and fish enhancement opportunities at Wynoochee Dam, Washington are presented. The recommended plan is an 11.3 megawatt hydropower addition which would produce an average 36,900 megawatt hours energy per year and a

405,000 - pound hatchery for anadromous fish which would add 127,500 adult fish to the annual harvest. Investment cost would be $43,410,000 (October 1981) of which $23,420,000 is for the hydropower facility and $19,990,000 for the hatchery.

1303 Plant Design And Operation

19960 **(DOE/ID/12122—T1) Small-Scale Hydroelectric Power Demonstration Project. Public Service Company of New Hampshire Drop No. 1 power plant expansion of Garvins Falls hydroelectric plant. Final technical and construction cost report.** (Public Service Co. of New Hampshire, Manchester (USA)). Dec 1982. Contract FC07-80ID12122. 158p. NTIS, PC A08/MF A01. Order Number DE83007221.

This final report discusses the technical, institutional and financial aspects of planning and constructing the Garvins Falls Hydroelectric Redevelopment Project. The Garvins Falls Hydroelectric Station, located on the Merrimack River in Bow, New Hampshire, is part of Public Service Company of New Hampshire's (PSNH) generating system. Realizing the need to reduce its dependence on foreign oil, in order to better serve the energy needs of our customers, PSNH initiated studies to identify viable hydroelectric projects. Garvins Falls was recognized as being one of the potentially better projects because it would utilize an existing dam, and further study indicated that redevelopment of the Garvins Falls site was an economic proposition whose primary benefit would be the potential replacement of energy generated by the use of imported fuel oil with that generated by a renewable source. Therefore, PSNH decided to design and construct the plant. The resulting design proposed expanding the existing project by adding two 2.75 tube-type turbine-generators with a total rated capacity of 6500 kW in a new power plant located in the area of the old powerhouse, necessitating complete demolition and removal of the old powerhouse. Construction of the new project began on August 4, 1980 and both new units were in commercial operation by December 30, 1981. The total cost for the Garvins Falls Hydroelectric Development Expansion Project was $7,946,025, reflecting an installed cost of $1222 per kilowatt. The redeveloped site will generate an estimated average increment in energy of 18,500,000 kWh per year, displacing the use of approximately 33,000 barrels of oil per year and will supply enough electricity to meet the needs of approximately 2600 households.

1304 Regulations And Licensing

REFER ALSO TO CITATION(S) 20835

19961 **(DOE/RA/23220—1) Legislator's guide to small-scale hydroelectric development.** Ferguson, W.R.; Wonstolen, K.A.; Counihan, R.H. (National Conference of State Legislatures, Denver, CO (USA)). Apr 1980. Contract FG03-78RA23220. 61p. NTIS, PC A04/MF A01. Order Number DE83007370.

In accordance with this renewed interest in small-scale hydro, the US Department of Energy (DOE) has established a national small-scale hydro program, including the funding of feasibility studies, demonstration projects and research carried out by federal agencies and other organizations, such as NCSL. This policy guide has been prepared as a preliminary legislative overview of the fundamental problems and possible solutions in developing small-scale hydro at existing dam sites. It is based upon the work of the NCSL Small-Scale Hydroelectric Policy Project, several regional small-scale hydro conferences, and the research efforts of other DOE contractors. State legislatures can provide valuable incentives and alleviate obstacles to small-scale hydro development. The need for well-defined state policies is crucial. The policy areas which warrant the most legislative attention include licensing procedures, taxation, marketing, financing, water rights and environmental regulation. This report describes obstacles, incentives and legislative options in each of the areas listed.

1305 Economics And Management

REFER ALSO TO CITATION(S) 19960, 20835

19962 **(PB—82-208794) Appropriate technology for planning hydroelectic power projects in Nepal: the need for assumption analysis. Technical report.** Chandler, C.G. (Texas Univ., Austin (USA). Center for Research in Water Resources). [nd]. 231p. NTIS, PC A11/MF A01.

This report describes and analyzes planning for hydropower development in Nepal. The objectives of the study are: to conduct an assessment of hydropower project planning in Nepal; to discuss the planning process from the perspective of an engineer seeking to improve it; and to categorize the problems and suggest solutions.

1306 Environmental Aspects

19963 **(FERC/EIS—0036) Black Bear Lake project, FERC No. 5715 - Alaska. Draft Environmental Impact Statement.** (Alaska Power Authority, Anchorage (USA)). Feb 1983. 175p. NTIS, PC A08/MF A01. Order Number DE83007429.

The Alaska Power Authority (Applicant) proposes to construct a hydroelectric project with an installed capacity of 6 MW on black Bear Creek, near the communities of Klawock, Craig, and Hydaburg, on Prince of Wales Island, Alaska. The project would inundate 70 ares of land, when the level of Black Bear Lake is raised to maximum pool elevation, and would consist of: (1) a 53-foot-high, 397-foot-long, concrete gravity dam with an uncontrolled spillway in the center of the dam with a discharge capacity of 1680 cfs; (2) a 4410-foot-long power conduit connectig the intake to the powerhouse; (3) a 226-acre reservoir with a usable storage capacity of 6850 acre-feet at the normal maximum water surface elevation of 1719 feet; (4) a powerhouse, containing two generating units, at elevation 263 feet; (5) a substation next to the powerhouse; (6) 53.2 miles of 34.5-kV and 7.2/12.5-kV transmission lines to the towns of Klawock, Craig, and Hydaburg; (7) a 2-mile-long access road to the powerhouse; and (8) recreation facilities.

14 SOLAR ENERGY

REFER ALSO TO CITATION(S) 21008

19964 **(BEOP—15) Solar energy in the Netherlands. Program of the second phase of the National Research Program on Solar Energy (1982-1985).** (Bureau Energie Onderzoek Projecten, Patten (Netherlands)). Oct 1982. 86p. (In Dutch). NTIS (US Sales Only), PC A05/MF A01. Order Number DE83901338.

The research program on solar energy in the Netherlands second phase for the years 1982-1985 is presented. About 100 projects are included in this program with emphasis on the thermal conversion of solar energy for low caloric applications, e.g. solar space heating with solar boilers and solar roofs. Solar energy combined with heat storage plays also an important role in this program. International cooperation is mentioned.

19965 **(EPRI-AP—2850-SR) Electric-utility solar-energy activities: 1982 survey update. Special report.** Spelman, J.R. (Electric Power Research Inst., Palo Alto, CA (USA)). Dec 1982. 118p. NTIS, PC A06/MF A01. Order Number DE83901447.

The results are presented of a survey to determine the scope of electric utility participation in solar energy projects in the United States. This eighth edition of the survey contains brief descriptions of 128 new projects for 1982 and summarizes significant changes from 1981 in ongoing projects. A total of 930 projects were reported by 235 utility companies. An index of projects by category, a statistical summary, a list of participating utilities with information contacts and addresses, a list of utilities with projects organized by technology, a list of utilities organized by state, and a list of new reports on utility-sponsored projects are included.

19966 (NP—2902727) **Solar industry index. The comprehensive guide to manufacturers and service organizations.** (Solar Energy Industries Association, Washington, DC (USA)). 1977. 388p. Solar Energy Industries Association, 1001 Connecticut Ave., NW, Suite 632, Washington, DC 20036 $8.00.

Manufacturers and service organizations are listed that manufacture products or provide services related to: solar water heating, space heating and cooling and swimming pool heaters; passive systems; installation and maintenance of solar equipment; consulting services; photovoltaic equipment and systems; wind energy systems and products; bioconversion; and solar thermal power generation. Manufacturers provide a general product description, explain the product's purpose, use and application, and performance and experience data. In the case of installation and maintenance contractors and consulting services, the general scope of service, experience in the field and geographical scope of service are given. Alphabetical, geographical, and categorical indices are included. A discussion of the basics and economics of solar energy is included, as well as a member directory of the Solar Energy Industries Association. (LEW)

1401 Resources And Availability

19967 (EUR—7790-EN) **Studies on parameterization of global, diffuse and direct solar radiation.** Kasten, F.; Dehne, K.; Golchert, H.J. (Commission of the European Communities, Luxembourg). 1982. 204p. Available from Commission of the European Communities, Luxembourg.

From 8 stations of the radiation network of Deutscher Wetterdienst, Federal Republic of Germany, the hourly sums of global radiation G measured during 10 year period 1966-1975 were analyzed in terms of monthly cumulative frequency distributions of mean hourly irradiance above given thresholds. From the National Radiation Center Hamburg, additionally the data of diffuse solar radiation D, direct solar radiation I, atmospheric radiation A and several other derived radiation quantities were analyzed in the same way. Furthermore, monthly frequency distributions of global radiation of the 8 stations were established with respect to persistence through given numbers of consecutive hours and consecutive days, respectively, of irradiation above given thresholds.

19968 (EUR—7792-FR) **Final report of the E.C. comparison of the national standard pyrheliometers.** Plazy, J.L. (Commission of the European Communities, Luxembourg). 1982. 18p. (In French). Commission of the European Communities, Luxembourg.

The homogeneity and the treacibility of radiation measurements practiced in the various meteorological networks in the European Countries assumes periodical comparisons between the national standard instruments. According to the Solar Programme of the European Communities a comparison campaign was held in the French radiometric center in Carpentras, from June 13 to 23 1978, with the participation of 15 standard pyrheliometers or absolute radiometers belonging to nine countries, including the World Radiometric Center of Davos. The results show a good accordance between the Angstroem type pyrheliometers within a 0.5% range. It can be deduced a good homogeneity for the network measurements of the solar radiation. The ratio between the International Pyrheliometric Scale of 1956 now in use and the World Radiometric Reference which will be used in 1981 was founded 0.9782. That confirms the results obtained by the World Meteorological Organisation.

19969 (EUR—7951-EN) **Summary report of the CEC-solar radiation data-programme 1975-1979.** Grueber, J.W. (Commission of the European Communities, Luxembourg). 1982. 149p. Available from Commission of the European Communities, Luxembourg.

Project F was established as a service project to support and assist with the data requirements of the other projects within the Solar Energy Programme. The first major task was to devise an action plan based on specific user requirements and by 1 January 1978 the Commission were in a position to award twenty-three contracts to seventeen participating institutions for the period up to 30 June 1979. During the rather short eighteen months period, five important goals were achieved. The preparation and publication of the first volume of the European Solar Radiation Atlas was completed. The improvement and extension of the existing European radiation data network was accomplished. New equipment was installed at a total of 56 stations. An evaluation procedure was selected for calculating the global irradiation of inclined surfaces. This procudure will be used during the second four-year programme for the preparation of volume two of the European Solar Atlas. Test Reference Year (TRYs) data were formed for the purposes of data reduction and subsequent use in computational simulation of solar energy systems. Progress was reported on the development of instrumentation to perform a spectral analysis of solar radiation, and early results from the work on satellite imagery revealed great promise. Much of the methodology devised in the first four-year programme now plays an important and vital role in the present work of Projekt F, in particular the work now being undertaken in the second four-year programme.

19970 (SERI/TR—215-1781) **Beer's-law-based, simple spectral model for direct normal and diffuse horizontal irradiance.** Bird, R.E. (Solar Energy Research Inst., Golden, CO (USA)). Dec 1982. Contract AC02-77CH00178. 41p. NTIS, PC A03/MF A01. Order Number DE83008132.

A spectral model for cloudless days that uses simple mathematical expressions and tabulated look-up tables to generate direct normal and diffuse horizontal irradiance is presented. The model is based on modifications to previously published simple models and comparisons with rigorous radiative transfer codes. This model is expected to be more accurate and to be applicable to a broader range of atmospheric conditions than previous simple models. The prime significance of this model is its simplicity, which allows it to be used on small desk-top computers. The spctrum produced by this model is limited to 0.3 to 4.0 μm wavelength with an approximate resolution of 10 nm.

1403 Economics

REFER ALSO TO CITATION(S) 20046, 20049, 20073

19971 (DOE/AL/19929—T3) **Impediments to capital formation in solar-thermal-energy systems.** Eisner, N.A. (Solar Energy Industries Association, Washington, DC (USA)). Feb 1983. Contract AC04-82AL19929. 45p. NTIS, PC A03/MF A01. Order Number DE83006998.

The current status of the solar thermal industry, the capital allocation process, and actions recommended to attract capital to the solar thermal program are discussed. Emphasis is on the utility market. It is found that the most significant impediment which currently retards capital formation and investment in solar thermal power projects is the economic viability of the projects, measured in terms of both risks and returns, and based on current expectations of future energy prices, inflation, and interest rates. The second is the current tax and regulatory law and the lack of an appropriate match between current incentives and the likely participants in a commercially viable industry. It is concluded that most of the risks must be borne by the public sector. (LEW)

19972 (DOE/JPL—1060-52, pp 295-318) **Potential benefits from a successful solar thermal program.** Terasawa, K.L.; Gates, W.R. (Jet Propulsion Lab., Pasadena, CA). 15 Jul 1982. NTIS, PC A15/MF A01.

From Parabolic dish solar thermal power annual program review; Atlanta, GA, USA (8 Dec 1981).

It is argued that solar thermal energy systems (STES) complement nuclear and coal technologies as a means of reducing the US dependence on imported petroleum. STES can be utilized in a broad range of applications servicing a variety of economic sectors, and they can be deployed in both near-term and long-term markets. Finally, the net present value of the energy cost savings attributable to electric utility and IPH applications of STES were estimated for a variety of future energy cost scenarios and levels of R & D success. This analysis indicated that the expected net benefits of developing an STES option are significantly greater than the expected costs of completing the required R & D. In addition, transportable fuels and chemical feedstocks represent a substantial future potential market for STES. Due to the basic nature of this R & D activity, however, it is currently impossible to estimate the value of STES in these markets. Despite this fact, private investment in STES R & D is not anticipated due to the high level of uncertainty characterizing the expected payoffs, and the non-trivial probability of realizing a large negative rate of return from these investments. Thus, federal participation in STES R & D is required if this valuable solar technology is to be available for deployment during this century.

19973 (DOE/JPL—1060-52, pp 329-338) **Economic evaluation of solar energy.** Wood, D. (Solar Steam, Inc., Fox Island, WA). 15 Jul 1982. NTIS, PC A15/MF A01.

From Parabolic dish solar thermal power annual program review; Atlanta, GA, USA (8 Dec 1981).

If a solar collector collects $1000 worth of energy per year and lasts 20 years it is not worth $20,000. The monetary value of the energy must be discounted to reflect investment alternatives for energy. Energy price changes must also be accounted for. Consumer costs and new energy costs are losing their disparity with the deregulation of energy prices. The solar dish on Fox Island is a model of solar economics. In average US climate the dish will deliver 250 MBTU per year at temperatures up to 750°F. In single present worth terms the dish system cost is about $15,000 (1980$) including maintenance. The system energy value exceeds $30,000. If the money is not discounted then the energy value would exceed $63,000. The dish approach has economic advantages over other generic solar collectors. International consumer interests indicate opportunities for further development and production of solar collecting systems.

19974 (LA-UR—82-2986) **Economic analysis of four passive-cooling strategies for commercial office buildings.** Mangeng, C.A.; Roach, F. (Los Alamos National Lab., NM (USA)). 1982. Contract W-7405-ENG-36. 14p. (CONF-830405—1). NTIS, PC A02/MF A01. Order Number DE83002082.

From 6. annual ASME technical conference on commercial building heating and cooling applications; Orlando, FL, USA (19 Apr 1983).

An economic assessment is presented of four passive-solar-cooling strategies whose performance was simulated in a typical single-story and multi-story office building. Economic performance of each passive-cooling strategy was measured by computing total annual dollar savings in electricity bills, by calculating an investment target from a cash-flow analysis, and by estimating regional and national savings potential assuming universal adoption of the strategy in new office buildings.

19975 (DOE/JPL—1060-52, pp 201-205) **Commercialization of parabolic dish systems.** Washom, B. (Advanco Corp., El Segundo, CA). 15 Jul 1982. NTIS, PC A15/MF A01.

From Parabolic dish solar thermal power annual program review; Atlanta, GA, USA (8 Dec 1981).

Federal regulatory and tax laws are reviewed and investigated as to where they are leading capital investment in renewable technologies. These laws are specifically: the Public Utility Regulatory Policy Act, the Energy Tax Act, the Economic Recovery Act, and the Energy Recovery Tax Act. An alternative to federal budget outlays for the commercialization of solar energy technologies, particularly the parabolic dish technologies, is found to be creating solar management companies/limited partnerships to take maximum advantage of the existing supply side economic incentives. 1405 Solar Energy Conversion

REFER ALSO TO CITATION(S) 19919, 19920, 19921, 19922, 19923, 19924, 19925, 19926, 19936, 19937, 19938, 19939, 19940, 19941, 19942, 19951, 19953, 19955, 19956, 19957, 19958, 20088, 20814, 20895, 20971, 20997, 20998, 20999, 21002, 21263, 21264, 21266, 21267, 21268, 21269, 21270, 21274, 21902, 21924, 21925

19977 (AD-A—115439/2) **X-ray induced electron emission. Final report.** Aeby, C.A. (Air Force Weapons Lab., Kirtland AFB, NM (USA)). Apr 1982. 206p. (AFWL-TR—81-222). NTIS, PC A10/MF A01.

The development and use of a magnetic spectrograph for the measurement of X-ray induced electron emission is described. Results are presented for metal and dielectric targets ranging in atomic number from Z=6 to Z-82. Materials studied were lead, tantalum, copper, aluminum, magnesium, solar cell cover glass, silica cloth, thermal control paint, Kevlar, Mylar, and conducting/nonconducting epoxy. Direct measurement was made of the quantum yield and energy distribution of electrons emitted at angles of 0 deg, 30 deg, 45 deg and 60 deg with respect to the surface normal of targets exposed to normal incidence filtered and unfiltered 50kV bremsstrah lung X-rays. Experimental results are compared with previous measurements where possible, and with computer code predictions where predictive capability matches the measurement range. The experimental results corroborates the cos theta angular dependence predicted by simple theoretical models, particularly for medium and high Z materials. A trend toward isotropic emission distribution is noted for the lower Z materials. Compared to the measured results, the emission yields predicted by a commonly used analytical model are low by approximately a factor of 2 for the unfiltered X-ray spectrum.

19978 (AD-A—120173/0) **Photoluminescence and electroluminescence as probes of interfacial charge-transfer processes relevant to cadmium sulfo-selenide-based photoelectrochemical cells. Technical report.** Streckert, H.H.; Tong, J.; Carpenter, M.K.; Ellis, A.B. (Wisconsin Univ., Madison (USA). Dept. of Chemistry). 23 Sep 1982. 23p. NTIS, PC A02/MF A01.

Samples of single-crystal, n-type Cd(X)Se(1-X) (where X is = to 1.000, 0.74, 0.49, 0.26, 0.11, 0.00) emit when excited with ultraband gap excitation. The 295 K band gaps monotonicly decrease with X from approx. 2.4 eV for CdS to approx. 1.7 eV for CdSe. Photoluminescence (PL) spectra are sharp and have band positions which vary nearly linearly with composition: lumbda(max) (nm) approximately equal to 718-210 X. The energetic proximity to the band gap, temperature dependence and decay times are all consistent with a description of the PL as edge emission. Measured PL efficiencies, phi(r), are approx. 0.0004 in air. When the samples are used as photoanodes in photo-electrochemical cells (PECs) employing aqueous polysulfide electrolyte, the emission of intensity can be quenched by the passage of photocurrent. The extent of quenching can be correlated with the photocurrent quantum efficiency. Electroluminescence (EL) can be initiated by using the CdS(X)Se(1-X) samples as dark cathodes in aqueous, alkaline, peroxydisulfate electrolyte at potentials cathodic of approx.-0.9 to -1.1V vs. SCE. The EL spectral distribution for a given sample is similar to that observed in PL experiments and indicates that the same emissive excited state is involved.

19979 (AD-A—120244/9) **Photoluminescence and electroluminescence in graded cadmium sulfoselenide electrodes: applications to photoelectrochemical cells. Technical report.** Carpenter, M.K.; Streckert, H.H.; Ellis, A.B. (Wisconsin Univ., Madison (USA). Dept. of Chemistry). 23 Sep 1982. 25p. NTIS, PC A02/MF A01.

Inhomogeneous samples of n-type CdS sub X Se sub 1-x (0 < or = X < or = 1) have been prepared by vapor-phase diffusion of S into a single-crystal CdSe substrate. Characterization of the samples by Auger electron spectroscopy (AES)/Ar ion sputter etching reveals that S has substituted for Se in the lattice to produce a graded region: The depth profile analysis indicates that from a composition with X nearly unity at the surface, X monotonically declines to zero over a distance of about 1 micron. Correspondingly, the band gap diminishes from about 2.4 eV for the CdS-like composition to about 1.7 eV for CdSe. Photoluminescence (PL) and electroluminescence (EL) from the graded material appear to derive from the luminescence of the CdS sub X Se sub 1-x compositions which comprise the graded region: emission from about 500-750 nm matches the spectral region spanned by PL and EL from homogeneous, single-crystal CdS sub X Se sub 1-X samples which emit near their band gap energies. A previously established linear correlation between emission maxima (nm) and composition in homogeneous CdS sub X Se sub 1-X samples provides a spatial probe of election hole(e- - h+) pair recombination in the inhomogeneous material: Regions from which PL and EL originate can be inferred from their spectral distribution in combination with the AES/depth profile data.

19980 **(BMFT-FB-T—81-069) Process development for large-scale production of CdS thin film solar cells sputtered copper sulfide layers and cadmium sulfide-copper sulfide heteorojunctions. Application of high rate sputtering using hot-pressed targets. Final report.** Mueller, W.; Muenz, W.D.; Radler, K.; Schuller, K.H. (Leybold-Heraeus G.m.b.H. und Co. K.G., Hanau (Germany, F.R.)). Apr 1981. 158p. (In several languages). NTIS, PC A08/MF A01.

A method was developed for the manufacturing of stoichiometrically composed copper sulphide-layers and of polycrystalline CdS-layers using a diode sputtering process. Heterojunctions were produced with a Cds-layer-thickness of 6 micrometers and on solar electric efficiency of 1%. High rate sputtering cathodes were developed and their suitfulness, when sputtering CdS, was tested. Using high rate sputtering the sputtering rate of targets with 200 mm diameter could be increased by the factor 5 to 9 nm/sec.

19981 **(BMFT-FB-T—81-109) Development of a cadmium selenide thin film solar cell. Final report, Mar. 1980.** Rickus, E. (Battelle-Institut e.V., Frankfurt am Main (Germany, F.R.)). Aug 1981. 85p. (In several languages). NTIS, PC A05/MF A01.

Examinations of the physical and chemical structure of thin CdSe films and their surfaces show that not only the electronic structure, but also the orientation and morphology of the semiconductor layer have a strong influence on the photovoltaic properties of the cells. The MIS structures with a chromium back contact, a 2 nm thick undoped CdSe layer, a 4 to 5 nm thick ZnSe layer, and a 20 nm thick gold layer show efficiencies of more than 6% related to a radiation f 100 mW/sq cm reaching the CdSe layer. At the present stage of development, efficiencies of more than 4% can be realized with very simple, not yet optimized ZnS antireflection coatings. As the analysis of current-voltage characteristics shows, the open circuit voltage and the presently relatively low fill factor can be enhanced by improved doping. This gives a realistic goal of about 10% efficiency for further work.

19982 **(BMFT-FB-T—81-159) Development of a process for an inexpensive production of thin film solar cells on an industrial scale. Final report, Jul. 1980.** Ruecker, N. (Heraeus (W.C.) G.m.b.H., Hanau (Germany, F.R.)). Sep 1981. 32p. (In several languages). NTIS, PC A03/MF A01.

A process was developed for an inexpensive production of CdS/Cu(x)S solar cells on an industrial scale. Using a pre-covering evaporated thickness of 3 micron Cd-films exhibit a grain size of more than 3 micron. Cadmium can be converted to alpha-CdS by a thermal treatment in a H_2S-containing atmosphere. It is expected that the time of conversion can be reduced by optimizing the process. The CdS grain size is some tenths of a micron on the surface below the surface it increases. The resistivity of converted CdS-layers can be enhanced in a definite manner by exposure to a glow discharge containing H_2S. Using this technique the connection of the CdS-layer to the substrate by means of Cd-metal is guaranteed. Further investigations should be extended to thicker layers. The Cu(x)S-film should be formed by thermal evaporation.

19983 **(CONF-820217—9) Short-rotation woody crops as a source of energy.** Ranney, J.W.; Cushman, J.H. (Oak Ridge National Lab., TN (USA)). 1982. Contract W-7405-ENG-26. 23p. NTIS, PC A02/MF A01. Order Number DE83007512.

From 9. energy technology conference; Washington, DC, USA (16 Feb 1982).

Progress in the Short-Rotation Woody Crops Program to date is discussed. Results from the 30 research projects currently in the program, as well as from other published short-rotation intensive culture (SRIC) data are drawn on. The possible contribution of eahc major research topic to increased SRIC productivity is assessed. Current and projected SRIC productivity rates across the United States are shown on maps, and the research needed to reach the project levels is explained. (MHR)

19984 **(CONF-821012—5) Economic analysis of short-rotation forestry.** Shen, S.Y.; Jones, P.C.; Vyas, A. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 23p. NTIS, PC A02/MF A01. Order Number DE83007744.

From Institue for Management Sciences/Operations Research Society of America joint meeting; San Diego, CA, USA (25 Oct 1982).

The principles and the technology of short-rotation forestry are described, with some emphasis on the new concept of wood-grass, an annually harvested tree crop, production. The model used for the economic analysis is described and the analysis and findings are presented. Wood-grass technology is identified as having substantial economic as well as technological potential. (MHR)

19985 **(CONF-8208114—1) Economic analysis method for short-rotation forestry.** Vyas, A.D.; Shen, S.Y. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 17p. NTIS, PC A02/MF A01. Order Number DE83007568.

From 2. national conference on renewable energy technologies; San Juan, Puerto Rico (1 Aug 1982).

A method for economic analysis of short-rotation forestry is presented; a model that employs linear complementarity optimization is an important component of this method. Given data on biomass production costs and methods for short-rotation forestry, the model selects the rotation period (i.e., harvesting cycle) that maximizes the net present value of all future profits for a specified rate of return. The ability to select the optimal rotation period is a unique feature of the model. The model's output, combined with independent analysis of the effect of tree spacing on production costs and woody biomass yield, allows specification of least-cost production systems for short-rotation forestry. The results of analyses of three hypothetical forestry plantations in the United States are summarized here. These results, while obtained for specific species and growing conditions, support three general conclusions regarding short-rotation forestry. For conventional straight-row planting of trees at a 4 x 4 ft (1.2 x 1.2 m) spacing, forage harvesting is more economical than whole-tree harvesting. Production costs for this planting strategy can be further reduced through an alternative harvesting technique that uses an innovative circular saw harvester now under development. Short-rotation forestry costs can be minimized, however, by adopting a planting approach in which seedling cuttings are sown as grass seeds are sown - randomly and very densely - and year-old samplings are forage harvested.

19986 **(DDS—108) Ethanol production using microbial cells trapped in polyacrylamidegels.** Villet, R.; Dillon, J. (Solar Energy Research Inst., Golden, CO (USA)). [nd]. 2p. (CONF-790547—). Solar Energy Research Inst., 1617 Cole Boulevard, Golden, CO 80401.

From Electrochemical Society meeting; Boston, MA, USA (7 May 1979).

The biotechnological advantages in using immobilised cells in fermentation systems are discussed and an experiment, using Saccharomyces cerevisiae in batch fermentations is described. The advantages using immobilised cells include the re-use of the micro-organisms, continuous processing mode of the system and enhanced productivities.

19987 **(DOE/ER/60002—1) Energetic and environmental aspects of utilizing crop and forest residues for biomass energy. Final report.** Pimentel, D.; Fast, S.; Gallahan, D.; Moran, M.A. (Cornell Univ., Ithaca, NY (USA)). Feb 1983. Contract AC02-81ER60002. 119p. NTIS, PC A06/MF A01. Order Number DE83008178.

Crop and forest residues are essential to protect the soil from erosion and rapid water runoff and to maintain soil organic matter and nutrients. Only an estimated 20% of the total residues remaining after harvest can be utilized for conversion because of environmental limitations and the impracticality of harvesting residues on some lands. The residues available for biomass energy could produce a maximum amount of gross energy equal to either 232 million barrels of high-grade liquid fuel (about 6% of current US oil consumption), 5% of the electrical energy, or 1.5% of total US energy if residues were used as heat (steam). The net yields of energy from the residues, however, would range from only 10 to 50% of the gross because of the large energy inputs for harvesting, hauling, nutrient replacement, and processing. Although these potential contributions to US energy needs are relatively small, it is renewable energy (assuming no environmental degradation) and therefore has some long-term value to the nation's energy program.

19988 **(DOE/ET/23197—T10) Semicrystalline casting process development and verification. Quarterly progress report number 8, March 19, 1982-June 19, 1982.** (Semix, Inc., Gaithersburg, MD (USA)). 1982. Contract FC01-80ET23197. 42p. NTIS, PC A03/MF A01. Order Number DE83006970.

Work on the first embodiment of the two dimensional thermal model of the Ubiquitous Crystallization Process (UCP) system was started. Boundary conditions consist of experimentally determined temperatures at the edges of the silicon brick. Work continues on the collection of this temperature data and on identifying sources of data for thermal properties of materials used in UCP. Using x-ray and chemical means of analysis, it was observed that neighboring grains can be related by a single or multiple order twinning process. The phenomenon of multiple order twinning allows for the possibility that grain boundaries can be the intersection of specific crystallographic planes such that the dislocation content can be low at the grain boundaries. This increases the effective electrical grain size. Subgrain rotations, on the other hand, are pure dislocation type grain boundaries and are therefore electrically active, as borne out by photoresponse mapping. It is postulated that these subgrain rotations are a mechanism by which a crystal can accommodate a locally high dislocation density. Work has beenperformanced on the fabrication of high efficiency large area solar cells. One hundred 10 cm x 10 cm cells were fabricated with a lot efficiency of 12.4% AMl using a first generation mask patern. It is expected that during the next quarter the resutls will be higher due to improvement of the front contact integrity by use of the second generation mask and an optimization of the BSF.

19989 **(DOE/ID/12328—T1) Alcohol recovery and carbon dioxide purification in alcohol plants using semipermeable membranes. Final technical report, September 1, 1981-August 31, 1982.** Klei, H.E.; Sundstrom, D.W. (Connecticut Univ., Storrs (USA)). Feb 1983. Contract FG07-81ID12328. 27p. NTIS, PC A03/MF A01. Order Number DE83006754.

The fermentation of sugars to ethanol produces carbon dioxide gas, which can carry appreciable quantities of alcohol vapor from the system. This project examined the use of commercially available membranes to separate a gaseous mixture into alcohol rich and carbon dioxide rich streams. The performance of silicone and cellulose acetate membranes in separating alcohol-carbon dioxide mixtures was studied with a single stage test cell. The cellulose acetate membrane passed the alcohol vapor preferentially and gave a better separation than the silicone membranes. The permeabilities of alcohol and carbon dioxide for the cellulose acetate membrane were used to design a continuous membrane column, which makes it possible to achieve a high degree of separation with membranes giving only modest enrichment in a single stage. For a 25 x 10^6 gal/yr alcohol plant, a computer simulation indicated that 200 continuous membrane columns with areas of 93 m^2 each would be needed to recover about 75% of the alcohol and to produce a byproduct stream containing 99.5% carbon dioxide.

19990 **(DOE/ID/12331—T1) Fermentative production of butanol from sorghum molasses as a potential agricultural fuel. Final report, June 26, 1981-September 25, 1982.** Fan, L.T. (Kansas State Univ., Manhattan (USA). Dept. of Chemical Engineering). Dec 1982. Contract FG07-81ID12331. 63p. NTIS, PC A04/MF A01. Order Number DE83008248.

A strain, Clostridium acetobutylicum ATCC 4259, suitable for butanol-acetone fermentation of sorghum molasses was selected from several strains of the American Type Culture Collection (ATCC). It was cultivated in the composition-optimized sorghum molasses medium. The microbial growth and sugar consumption pattern in the sorghum molasses medium exhibited a typical diauxie phenomenon. The results strongly suggest that the difficulty encountered by the Weizmann type of organisms in butanol-acetone fermentation of molasses is due to the diauxie phenomenon causing a significant decrease in the solvent production rate. Acid hydrolysis of sorghum molasses minimizes the occurrence of the phenomenon, thereby remarkably increasing the solvent yield. The final solvent concentrations in the inverted molasses medium were butanol, 1.0% (w/v); acetone, 0.37% (w/v); ethanol, 0.18% (w/v); and total solvent, 1.55% (w/v). The total solvent yield in the inverted sorghum molasses medium was 30.3% based on the weight of sugar consumed. Effects of the temperature, agitation and heat-shocking were also investigated.

19991 **(DOE/ID/12342—T1) New method for simultaneous saccharification and fermentation. Final report.** Charles, M. (Lehigh Univ., Bethlehem, PA (USA). Biotechnology Research Center). 1 Feb 1983. Contract FG07-81ID12342. 88p. NTIS, PC A05/MF A01. Order Number DE83008247.

It was shown that the operating cost of the industrially practiced simultaneous saccharification and fermentation (S/F) of corn starch to ethanol can be decreased significantly. At a scale of 7.8 million gpy anhydrous ethanol it should be possible to decrease the saccharification/fermentation operating costs from about 16 cents per gallon of ethanol produced (anhydrous basis) to about 13 cents per gallon. The improvement is achieved by recirculating unconverted dextrins in the broth through an external immobilized amyloglucosidase (AMG) reactor maintained at 60°C; a microporous hollow fiber filter is used to separate the dextrins from the yeast.

19992 **(DOE/JPL—9950-776) ECUT: energy conversion and utilization technology program. Biocatalysis research activity. Technical and economic assessment of processes for the production of butanol and acetone.** (Chem Systems, Inc., Tarrytown, NY (USA)). Sep 1982. Contract AI01-81CS66001. 76p. NTIS, PC A05/MF A01. Order Number DE83007263.

A preliminary technical and economic evaluation of a process which produces mixed solvents (butanol/acetone/ethanol) via fermentation of sugars derived from renewable biomass resources is presented. The objective is to assess the technology of producing butanol/acetone from biomass, and select a viable process capable of serving as a base case model for technical and economic analysis. The general criteria utilized in determining the design basis for the process are profit potential and non-renewable energy displacement potential. The feedstock chosen, aspen wood, was selected from a number of potential renewable biomass resources as the most readily available in the United States and for its relatively large potential for producing reducing sugars. The butanol/acetone/ethanol (ABE) production facility consists of three major sections: pretreatment and enzyme hydrolysis, fermentation, and purification.

19993 (DOE/JPL/954373—81/19) Silicon-ingot casting: heat-exchanger method (HEM); multi-wire slicing: fixed-abrasive slicing technique (FAST). Phase III and Phase IV. Silicon sheet-growth development for the large-area sheet task of the Low-Cost Solar-Array Project. Final report, December 15, 1978-June 30, 1981. Schmid, F.; Khattak, C.P. (Crystal Systems, Inc., Salem, MA (USA)). Dec 1982. Contract NAS-7-100-954373. 268p. NTIS, PC A12/MF A01. Order Number DE83007035.

It has been demonstrated that directional solidification by the Heat Exchanger method (HEM) is a viable approach for directional solidification of silicon ingots to be used for terrestrial solar cell applications. Some of the significant advances made during this phase of the program are listed. Some of the problems encountered have been growth rate decrease with increased ingot height, silicon carbide precipitates, and high dislocation density in HEM material. The silicon carbide is attributed to backstreaming of oil vapors from the vacuum pump; the high dislocation density is associated with the thermal history of the boule. Using solar metallurgical meltstock nearly single crystal structure has been achieved with one HEM directional solidification. Solar cells fabricated using this meltstock have shown up to 12.33% conversion efficiency. The projected add-on cost of HEM processing using the best simultaneous achievements is \$17.39/m^2 - well within the allocation of \$18.15/m^2 for 1986 goals.

19994 (DOE/JPL/956046—82/5) Structure of (110) tilt boundaries in large-area solar silicon. Annual report, August 31, 1981-September 1982. Ast, D.G. (Cornell Univ., Ithaca, NY (USA). Dept. of Materials Science and Engineering). Dec 1982. Contract NAS-7-100-956046. 25p. NTIS, PC A02/MF A01. Order Number DE83007848.

Symmetric second- and third-order twin boundaries in silicon have been observed using high-resolution TEM. Micrographs of a symmetric (221) $\Sigma = 9$ boundary exhibited contrast features consistent with the zig-zag dislocation structure. A model for a symmetric (552) $\Sigma = 27$ boundary was constructed and found to have the same periodicity and faceted structure as an experimentlaly observed $\Sigma = 27$ boundary. A system for modelling the structure of (110) tilt boundaries in tetrahedrally coordinated materials was developed. Boundaries with (110) median planes and misorientations up to 70.53° were constructed using a repeating series of simple structural units.

19995 (DOE/JPL/956061—6) Investigation of the hydrochlorination of SiCl$_4$. Quarterly report, October 9, 1982-January 8, 1983. Flat-Plate Solar-Array Project, Advanced-Materials Research Task. Mui, J.Y.P. (Solarelectronics, Inc., Bellingham, MA (USA)). 18 Jan 1983. Contract NAS-7-100-956061. 43p. NTIS, PC A03/MF A01. Order Number DE83007036.

A basic, experimental study on the hydrochlorination of silicon tetrachloride and metallurgical-grade silicon with hydrogen gas to form trichlorosilane has been carried out to greatly expand the range of reaction conditions. The equilibrium constant, K/sub p/, for the hydrochlorination reaction was measured as a function of temperature, pressure, and concentration. The variation of the equilibrium constant as a function of temperature provided the measurement on the heat of reaction, ΔH, by the Second Law Method. The value of ΔH was measured to give 10.6 Kcal/mole. The equilibrium constant was also studied as a function of concentration. In agreement with the theory, the equilibrium constant remained constant with respect to the varying $H_2/SiCl_4$ feed ratios. On the other hand, the effect of pressure on the equilibrium constant was found to be more complex. At the lower-pressure range of 25 psig to 100 psig, the equilibrium constant remained constant within experimental error. However, at the higher-pressure range of 150 psig to 500 psig, the equilibrium constant showed a much higher value.

19996 (DOE/JPL/956312—82/01) Stress studies in EFG. First quarterly progress report, July 9, 1982-September 30, 1982. (Mobil Solar Energy Corp., Waltham, MA (USA)). 15 Oct 1982. Contract NAS-7-100-956312. 18p. NTIS, PC A02/MF A01. Order Number DE83007522.

A program to study stress generation mechanisms in silicon sheet growth was started. The purpose of the research is to define post-growth temperature profiles for the sheet that can minimize its stress during growth at high speeds, e.g., greater than 3 cm/min. The initial tasks described concern work in progress toward the development of computing capabilities to (1) model stress-temperature relationships in steady-state ribbon growth, and (2) provide a means to calculate realistic temperature fields in ribbon, given growth system component temperatures as boundary conditions. If it is determined that low stress configurations can be achieved, the modeling is to be tested experimentally by constructing low-stress growth systems for EFG silicon ribbon.

19997 (DOE/JPL/956312—83/02) Stress studies in EFG. Second quarterly progress report, October 1, 1982-December 31, 1982. (Mobil Solar Energy Corp., Waltham, MA (USA)). 15 Feb 1983. Contract NAS-7-100-956312. 22p. NTIS, PC A02/MF A01. Order Number DE83007914.

A computer code which can account for plastic deformation effects on stress generated in silicon sheet grown at high speeds is fully operative. Stress and strain-rate distributions are presented for two different sheet temperature profiles. The calculations show that residual stress levels are very sensitive to details of the cooling profile in a sheet with creep. Experimental work has been started in several areas to improve understanding of ribbon temperature profiles and stress distributions associated with a 10-cm-wide ribbon cartridge system.

19998 (DOE/JPL/956352—1) Hermetic edge sealing of photovoltaic modules. Quarterly technical report. Nowlan, M.J. (Spire Corp., Bedford, MA (USA)). Feb 1983. Contract NAS-7-100-956352. 25p. NTIS, PC A02/MF A01. Order Number DE83007496.

The edge-sealing technique is accomplished by a combination of a chemical bond between glass and aluminum, formed by electrostatic bonding, and a metallurgical bond between aluminum and aluminum, formed by ultrasonic welding. Such a glass-to-metal seal promises to provide a low-cost, long-lifetime, highly effective hermetic seal which can protect module components from severe environments. It is the purpose of this program to develop the above-described sealing techniques and to demonstrate their efectiveness by fabricating a small number of dummy modules, up to eight inches square in size, and testing them for hermeticity using helium-leak-testing methods. Non-destructive test methods will be investigated.

19999 (EUR—7566-EN) Effect of the electrical field in the membrane of photosynthesis. Witt, H.T.; Graeber, P.; Renger, G.; Schlodder, E.; Tiemann, R.; Eckert, H.J.; Sewe, K.U. (Commission of the European Communities, Luxembourg). 1981. 53p. Available from Commission of the European Communities, Luxembourg.

One serious problem for photoelectrochemical solar cells is the tendency of semiconductors to be photodecomposed in contact with an electrolyte. This problem appears as well in cells for water decomposition as in cells for photovoltaic power generation. A great deal of emphasis has therefore internationally been placed on attempts to prevent photodecomposition of the electrodes. Most of the work which is summarized has been devoted to this problem. The aim was to understand the thermodynamics and the kinetic mechanisms of decomposition reactions in order to find either means for the protection of these semiconductors which are known as unstable under normal circumstances.

20000 (EUR—7608-EN) Conversion and chemical storage of solar energy in a photoelectrochemical cell. Lepoutre, G.; Richoux, M.C.; de Backer, M. (Commission of the European Communities, Luxembourg). 1981. 60p. Available from the Commission of the European Communities, Luxembourg.

This work has shown that it was possible to reduce water into hydrogen, by using visible light, Zn, Cr or Mg phthalocyanins as photosensitizers, and, electrochemical recycling of the dyes. The volumes of hydrogen evolved correspond to several uses of the dyes. The amount of dye contained in the cell is of the order of 2 x 10^{-6} Moles. If all the hydrogen evolved came from the destruction of the dye, the maximum volume attainable would be 2.24x10^{-2} ml.

The volumes obtained show that in most cases, the phthalocyanin was used about ten times. Studies of the optical spectra before and after each experiment did not show any appreciable degradation of the dye.

20001 (LBL—15171) Photosensitized electron transport across lipid vesicle walls. Ford, W.E. (Lawrence Berkeley Lab., CA (USA)). Nov 1982. Contract AC03-76SF00098. 400p. NTIS, PC A17/MF A01. Order Number DE83007046.

Thesis.

The prospect of using lipid bilayer vesicles in artificial photosynthetic devices which decompose water photochemically as a means of converting and storing solar energy is addressed. The vesicles serve to mediate charge separation during photosensitized electron transfer reactions. The vesicle systems of particular interest have amphiphilic dyes dissolved in the walls of the vesicles and aqueous solutions of electron-donating and accepting molecules separated by the walls. Photosensitized electron transfer across the bilayer from the donor to the acceptor results in spatially separated redox products, thereby preventing energy-wasting back-reactions between these intermediates in the decomposition of water. The overall strategy and some physicochemical properties of vesicles are outlined. Some electronic spectral and photochemical properties of synthetic amphiphilic dyes are characterized, with emphasis on micellar aqueous media. The evolution of a model system for studying photosensitized electron transport across vesicle walls is described.

20002 (N—82-14228) Tank testing of a 2500-cm2 solar panel. Bever, R.S.; Staskus, J. (National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center). Oct 1981. 17p. NTIS, PC A99/MF A01.

In NASA. Lewis Research Center Spacecraft Charging Technol., 1980 p 211-227 (SEE N82-14213 05-18) REFS.

A 50 cm by 50 cm solar array panel test patch was investigated for spacecraft charging and arcing effects. Bombardment with monochromatic electron was carried out. Some objectives of the test were: (1) to estimate at what voltage of electron bombardment arcing would be probable (2) to find whether the arc's energy would be tolerable or damagingly large (3) to try and separate thermal and photoeffects and, (4) to see whether materials used were such as to minimize arcing. Some conclusions were: In sunlight the tracking data relay satellite's solar panel which has ceria glass on the front and conductive paint on the backside is probably a good design for reducing charge-up. In a geomagnetic substorm simulated in testing there will be arcing at the interconnects during eclipse and transitions into and out of eclipse in testing especially in view of the very cold temperatures that will be reached by this lightweight array. Ceria-doped glass is preferred to fused silica glass for reducing charge build up. The Kapton bare patch should still be conductively painted. The differential voltages on the panel determine when arcing first begins, and the electron beam voltages vary depending upon whether the metallic structure is directly grounded or semifloating.

20003 (N—8228838) Production of liquid fuels out of plant biomass and refuse: Methods, cost, potential. (Stuttgart Univ. (Germany, F.R.)). Sep 1981. 99p. (MIXED). NTIS, PC A05/MF A01.

Different ways of producing biomass and its conversion into high grade fuel for vehicles are reviewed with particular reference to physical and geographical factors, pertaining in the Federal Republic of Germany (FRG). Even with the potentially small amount of biomass in the FRG, the fueling of diesel engines with rape oil or modified ethanol, which can be obtained from any cellulosic feedstock, seems to pose the fewest difficulties and promises greatest efficiency. However, the amount of fuel produced from biomass can probably only meet a very small percentage of the total amount required.

20004 (N—8229354) New strategy for efficient solar energy conversion: Parallel-processing with surface plasmons. Anderson, L.M. (National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center). 1982. 13p. (NASA-TM—82867; E—1236). NTIS, PC A02/MF A01.

An advanced concept for direct conversion of sunlight electricity, which aims at high efficiency by tailoring the conversion process to separate energy bands within the broad solar spectrum is introduced. The objective is to obtain a high level of spectrum-splitting without sequential losses or unique materials for each frequency band. In this concept, sunlight excites a spectrum of surface plasma waves which are processed in parallel on the same metal film. The surface plasmons transport energy to an array of metal-barrier-semiconductor diodes, where energy is extracted by inelastic tunneling. Diodes are tuned to different frequency bands by selecting the operating voltage and geometry, but all diodes share the same materials.

20005 (NASA-CR—161922) Solar cell modules for plasma interaction evaluation. Final report. (Lockheed Missiles and Space Co., Inc., Sunnyvale, CA (USA)). Oct 1981. 47p. NTIS, PC A03/MF A01.

A plasma interaction analysis in support of the solar electric propulsion subsystem examined the effects of a large high voltage solar array interacting with an ion thruster produced plasma. Two solar array test modules consisting of 36 large area wraparound contact solar cells welded to a flexible Kapton integrated circuit substrate were fabricated. The modules contained certain features of the effects of insulation, din-holes, and bonding of the cell to the substrate and a ground plane. The possibility of a significant power loss occurring due to the collection of charged particles on the solar array interconnects was the focus of the research.

20006 (NASA-CR—165040) Modelling of polymer photodegradation for solar cell modules. Somersall, A.C.; Guillet, J.E. (Toronto Univ., Ontario (Canada)). Jul 1981. 16p. NTIS, PC A02/MF A01.

A computer program developed to model and calculate by numerical integration the varying concentrations of chemical species formed during photooxidation of a polymeric material over time, using as input data a choice set of elementary reactions, corresponding rate constants and a convenient set of starting conditions is evaluated. Attempts were made to validate the proposed mechanism by experimentally monitoring the photooxidation products of small liquid alkane which are useful starting models for ethylene segments of polymers like EVA. The model system proved inappropriate for the intended purposes. Another validation model is recommended.

20007 (NASA-CR—165041) Modelling of polymer photodegradation for solar cell modules. Somersall, A.C.; Guillet, J.E. (Toronto Univ., Ontario (Canada)). Apr 1981. 17p. NTIS, PC A02/MF A01.

A computer model including an integration routine was developed and demonstrated to simulate, in principle, the chemical changes which may occur in the photooxidation of hydrocarbons, using as input data a set of elementary reactions, corresponding rate constants and appropriate starting conditions. Application of this model to the photooxidation of pottant and plastic materials used in the LSA module designs provides a reliable predictive capability regarding the useful lifetime of these materials. An earlier mechanism consisting of 46 reactions was simplified considerably by reducing the number of formal termination steps since it became apparent that the major termination process goes via the peroxy radicals. In addition, new reactions of oxygen with acryl radicals (from Norrish type I) to form peracids, which then decompose to form carbon dioxide are included.

20008 (NASA-CR—165042) Flat-plate solar array project. Task 1: silicon material: investigation of the hydrochlorination of $SiCl_4$. Mui, J.Y.P. (Solarelectronics, Inc., Bellingham, MA (USA)). Oct 1981. 17p. NTIS, PC A02/MF A01.

A two inch-diameter stainless steel reactor was designed to operate at pressure up to 500 psig and at temperature up to 600 C in order to study the hydrochlorination of silicon tetrachloride and metallurgical grade (m.g.) silicon metal to trichlorosilane. The hydrochlorination apparatus is described and operation safety and pollution control are discussed.

20009 (NASA-CR—165043) Development of an all-metal thick film cost effective metallization system for solar cells. Ross, B. (Ross (Bernd) Associates, San Diego, CA (USA)). Sep 1981. 40p. NTIS, PC A03/MF A01.

The objectives of the investigation were to provide all-metal screenable pastes using economical base metals, suitable for application to low-to-high conductivity silicon of either conductivity type and possibly to aluminum surfaces. Experiments were conducted with variations in paste parameters, firing conditions, including gas ambients, furnace furniture, silicon surface and others. A liquid medium, intended to provide transport during the carbon fluoride decomposition was incorporated in the paste with promising results.

20010 (NASA-CR—165044) Development of an all-metal thick film cost affective metallization system for solar cells. Ross, B. (Ross (Bernd) Associates, San Diego, CA (USA)). Sep 1981. 32p. NTIS, PC A03/MF A01.

An economical thick film solar cell contact for high volume production of low cost silicon solar array modules was investigated. All metal screenable pastes using base metals were studied. Solar cells with junction depths varying by a factor of 3.3, with and without a deposited oxide coating were used. Cells were screened and fired by a two step firing process. Adhesion and metallurgical results are unsatisfactory. No electrical information is obtained due to inadequate contact adhesion.

20011 (NASA-CR—165060) Advanced solar energy conversion. Lee, J.H. (Vanderbilt Univ., Nashville, TN (USA)). Aug 1981. 22p. NTIS, PC A02/MF A01.

An atomic iodine laser, a candidate for the direct solar pumped lasers, was successfully excited with a 4 kW beam from a xenon arc solar simulator, thus proving the feasibility of the concept. The experimental set up and the laser output as functions of operating conditions are presented. The preliminary results of the iodine laser amplifier pumped with the HCP array to which a Q switch for giant pulse production was coupled are included. Two invention disclosures - a laser driven magnetohydrodynamic generator for conversion of laser energy to electricity and solar pumped gas lasers - are also included.

20012 (NP—3900698) Annual report, July 1981-June 1982. Brown, N.E. (Hawaii Univ., Manoa (USA). Hawaii Natural Energy Inst.). 1982. 95p. University of Hawaii, Hawaii Natural Energy Inst., Manoa, HI.

The report consists of brief progress reports describing thirty-five research projects conducted during FY 1981-1982 in the areas of geothermal energy, ocean thermal energy conversion, biomass, wind energy, solar energy, and hydrogen storage. (ACR)

20013 (NP—3901019) Energy from biomass: Possibilities of a regional development and the substitution of crude oil imports in Brazil. Gaese, H. (Forschungsstelle fuer Internationale Agrarentwicklung e.V., Heidelberg (Germany, F.R.)). 1981. 31p. (In German). NTIS (US Sales Only), PC A03/MF A01. Order Number DE83901019.

Within the framework of the energy policy of Brazil the production of alcohol - 95% produced from sugar cane - ranks in the first place as the share of fuel consumption in the traffic sector is considerable. In the North-East of the country large bioenergy sources lie fallow near the dry zone. Their utilization would not even require a new plant: these energy sources are the Babacu palm-tree area of the transition zone to the Amazon River. The potential would not only be able to substitute alcohol from sugar cane but it also supplies valuable charcoal (e.g. for steel production).

20014 (NP—3901304) Wood-waste fuels preparation and handling. (Levelton (B.H.) and Associates Ltd., Vancouver, British Columbia (Canada)). Apr 1982. 394p. NTIS (US Sales Only), PC A17/MF A01.

An evaluation of wood waste fuels handling and preparation systems is provided. Major generic components of fuel preparation and handling systems are identified first. The capabilities and limitations of these components are assessed. Size and cost specifications are given for most manufacturers and distributors in Canada. Case studies are given to illustrate successful and unsuccessful wood fuel handling systems. Existing problem areas for wood waste preparation and handling components and systems are identified. Recommendations for the development of improved fuel handling equipment are made.

20015 (NP—3901551) Ohio biomass for energy: annual potential by county. Hitzhusen, F.; Bacon, T.; Cathcart, T.; Gowen, M. (Ohio State Univ., Columbus (USA). Dept. of Agricultural Economics and Rural Sociology; Ohio Agricultural Research and Development Center, Columbus (USA)). Apr 1982. 67p. Ohio State Univ., Agricultural Research and Development Center, Columbus, OH 43210.

The annual sustainable amount of biomass resources in each of Ohio's 88 counties is determined for fuel or energy purposes. The location and magnitude of potential demand for biomass energy resources in the state of Ohio are assessed. Included among the biomass resources are forest biomass, municipal solid waste, three crop residues (corn, wheat, and oats), and animal or livestock manures. The methodology and results of the estimation of usable biomass by resource or feedstock type are presented. Total annual biomass potential in Ohio from the resources inventoried is summarized. (MHR)

20016 (NYSERDA—82-29) Whey protein concentrate market enhancement. Final report. Hudson, L. (Little (Arthur D.), Inc., Cambridge, MA (USA); Cornell Univ., Ithaca, NY (USA). Dept. of Food Science). Sep 1982. 132p. New York State Energy Research and Development Authority, Two Rockerfeller Plaza, Albany, NY 12223.

Whey protein concentrate (WPC) was studied to see whether or not there was sufficient depth in the marketplace to accommodate increased WPC production in the event more whey was converted into alcohol. It was concluded that the current market for WPC is still immature and ample room exists in the marketplace to produce and dispose of WPC. In addition, WPC literature was reviewed so as to evaluate the current state of the art producing WPC. Considerable evidence suggests that more product formulation work is needed to move WPC into the general marketplace. Concurrent to the market and ltierature study WPC was incorporated into select categories of foods where finished goods were enhanced by having WPC incorporated in their formulations. Formulations were produced to demonstrate the fact that products such as ice cream, breedings and batters for fish sticks, and orange juice can be enhanced by using WPC.

20017 (PB—82-213729) Wood and energy in Vermont. Staff report. Bailey, M.R.; Wheeling, P.R. (Economic Research Service, Washington, DC (USA). Natural Resource Economics Div.). Mar 1982. 61p. NTIS, PC A04/MF A01.

This report presents information on residential use of wood energy obtained from two household surveys. The first survey, conducted in 1979, obtained detailed information from more than 550 households. The second or followup survey, conducted a year later, provided estimates of fuelwood use in 1979-80, and more information on likely impacts of the increase in residential demand for wood energy on the State forest resource base.

20018 (PNL—4593) Treatment of biomass gasification wastewater using a combined wet air oxidation/activated sludge process. English, C.J.; Petty, S.E.; Sklarew, D.S. (Pacific Northwest Lab., Richland, WA (USA)). Feb 1983. Contract AC06-76RL01830. 60p. NTIS, PC A04/MF A01. Order Number DE83007801.

A lab-scale treatability study for using thermal and biological oxidation to treat a biomass gasification wastewater (BGW) having a chemical oxygen demand (COD) of 46,000 mg/l is described. Wet air oxidation (WA0) at 300°C and 13.8 MPa (2000 psi) was used to initially treat the BGW and resulted in a COD reduction of 74%. This was followed by conventional activated sludge treatment using operating conditions typical of municipal sewage treatment plants. This resulted in an additional 95% COD removal. Overall COD reduction for the combined process was 99%. A detailed chemical analysis of the raw BGW and thermal and biological effluents was performed using gas chromatography/mass spectrometry (GC/MS). These results showed a 97% decrease in total extractable organics with WA0 and a 99.6% decrease for combined

WAO and activated sludge treatment. Components of the treated waters tended to be fewer in number and more highly oxidized. An experiment was conducted to determine the amount of COD reduction caused by volatilization during biological treatment. Unfortunately, this did not yield conclusive results. Treatment of BGW using WAO followed by activated sludge appears to be very effective and investigations at a larger scale are recommended.

20019 (PNL-SA—11039) **Catalytic steam gasification of biomass for methanol and methane production.** Mudge, L.K.; Mitchell, D.H.; Baker, E.G.; Brown, M.D.; Robertus, R.J. (Pacific Northwest Lab., Richland, WA (USA)). 1983. Contract AC06-76RL01830. 48p. (CONF-830114—5). NTIS, PC A03/MF A01. Order Number DE83008024.

From Energy from biomass and wastes symposium; Lake Buena Vista, FL, USA (24 Jan 1983).

The purpose of the project is to evaluate the technical and economic feasibility of producing specific gas products via the catalytic gasification of biomass. The results of research conducted from October 1980 to November 1982 are presented. The project was comprised of laboratory studies, process development, and economic analyses. The laboratory studies were conducted to develop operating conditions and catalyst systems for generating methane-rich gas, synthesis gases, hydrogen, and carbon monoxide. The process development unit (PDU), previously used for tests at atmospheric pressure, was modified for operation at absolute pressures of up to 10 atm (1000 kPa). A program for use on a microcomputer was written to determine the effect of yield changes at elevated pressures on process economics.

20020 (SAND—82-7133) **Second-generation photovoltaic-concentrator-array design.** Broadbent, S.; Baumann, J.E.; Heller, B.W.; Hughes, D.J.; Marshall, L.S.; Semma, R.P.; Stegeman, R.E. (Sandia National Labs., Albuquerque, NM (USA); Martin Marietta Corp., Denver, CO (USA)). Dec 1982. Contract AC04-76DP00789. 389p. NTIS (US Sales Only). Order Number DE83007578.

Martin Marietta Corporation's design of a second generation concentrating photovoltaic module is described. The passively cooled 13-kg module uses 2 columns of 7 point focus Fresnel lenses that are each 20.7 cm by 20.7 cm, and 14 planar junction silicon cells. The geometric concentration is 84X. Martin Marietta fabricated five prototype modules and shipped three to Sandia for testing. The modules' peak efficiency was 14.1% which is the highest to date for a module using silicon cells.

20021 (SERI/PR—9038-1-T1) **Feasibility of biogas production on farms.** Jewell, W.J.; Adams, B.A.; Eckstrom, B.P.; Fanfoni, K.J.; Kabrick, R.M.; Sherman, D.F. (Cornell Univ., Ithaca, NY (USA). Dept. of Agricultural Engineering). Jan 1982. Contract AC02-77CH00178;AC02-76ET20051. 178p. NTIS, PC A09/MF A01. Order Number DE83007385.

An overview of biogas technology is presented. The following topics are discussed: the potentials and limitations of anaerobic digestion; on-site energy generation: relationship of demand to supply; economics of farm-scale biogas production; design considerations of the biogas production system; gas utilization; safety guidelines and regulations; and operation, maintenance, and diagnostics of small methane generation systems. (MHR)

20022 (SERI/STR—231-1744) **Parametric analysis support for alcohol-fuels process development. Final report, 1 January-30 June 1981.** (Chem Systems, Inc., New York (USA)). Feb 1983. Contract AC02-77CH00178. 169p. NTIS (US Sales Only). Order Number DE83008130.

Parametric analyses are described of an alcohol fuels plant producing 50 million gal/y of ethanol by the high temperature dilute acid hydrolysis of aspen wood or corn stover. Analyses were carried out using a computer simulation. The simulation performs material and energy balances, estimates capital and operating costs, and calculates the selling price of ethanol. Pretretments and delignification are shown to be justified only if the value of lignin is greater than $0.40/lb. Sensitivity analyses determine the effect of hydrolysis conditions on yield and selling price. Sugar concentration prior to fermentation is shown not to be justified.

20023 (SERI/TP—232-1733) **Fermentation of soluble cello-oligosaccharides by yeasts.** Lastick, S.M.; Spindler, D.D.; Grohmann, K. (Solar Energy Research Inst., Golden, CO (USA)). Feb 1983. Contract AC02-77CH00178. 14p. (CONF-820909—18). NTIS, PC A02/MF A01. Order Number DE83007317.

From National meeting of the American Chemical Society; Kansas City, MO, USA (1 Sep 1982).

Yeast strains that ferment cellobiose were examined with respect to fermentation on soluble cellodextrin preparations. Hydrolysis of the fermentation products was followed using thin layer chromatography. Candida and Brettanomyces sp. hydrolyze cellobiose and, at a much lower rate, cellotriose, indicating the presence of β-glucosidase (EC 3.2.1.21) activity. Enzyme assays conducted on B. clausenii fermentations indicated that the β-glucosidase remained cell-associated during fermentation. Torulopsis sp. hydrolyzed all of the cello-oligo-saccharides, indicating exoglucanase (EC 3.2.1.91) activity. The exogluconanase, a glycoprotein with an apparent molecular weight of 8.4 x 10^4 daltons, is exported into the culture medium.

20024 (SERI/TR—8104-3-T4) **Low-cost, sprayed CdTe solar-cell research. Final report.** Squillante, M.R.; Turcotte, R.; Entine, G.; Goldner, R.B. (Tufts Univ., Medford, MA (USA)). Dec 1982. Contract AC02-77CH00178. 66p. NTIS, PC A04/MF A01. Order Number DE83007275.

The program reported has examined techniques to deposit CdTe based solar cells by a spray pyrolysis process called Reductive Multichemical Deposition (RMD). The principles of the process and the major results obtained during the program are appended. Results of electrical testing performed on films and devices are presented, and the experiments performed on the CdS layer are discussed. Improving the quality of the CdS layer, the CdS surface CdS/CdTe interface was deemed to be crucial in increasing device performance. In addition, films of CuIn Se_2 were spray deposited in order to investigate further the potential power of the RMD process. (LEW)

20025 **Photocapacitance of mobile carriers in hydrogenated amorphous silicon solar cells.** Crandall, R.S. (RCA Laboratories, Princeton, New Jersey 08540). *Applied Physics Letters;* **42**: No. 5, 451-453(1 Mar 1983). Contract AC02-77CH00178.

Measurements of the capacitance due to photogenerated electrons and holes that are displaced by the electric field are described. A model calculation shows that the photocapacitance is a measure of the drift mobility of the carriers.

20026 **Method of fabricating a solar cell array.** Coyle, P.J.; Crouthamel, M.S.; Lazzery, A.G. (to Dept. of Energy). US Patent 4,364,508. 21 Dec 1982. Filed date 14 Oct 1980. vp.

PAT-APPL-196205.

A first set of pre-tabbed solar cells are assembled in a predetermined array with at least part of each tab facing upward, each tab being fixed to a bonding pad on one cell and abutting a bonding pad on an adjacent cell. The cells are held in place with a first vacuum support. The array is then inverted onto a second vacuum support which holds the tabs firmly against the cell pads they abut. The cells are exposed to radiation to melt and reflow the solder pads for bonding the tab portions not already fixed to bonding pads to these pads.

20027 **Environmental testing of single-crystal silicon solar cells with screen-printed silver contacts.** Firor, K.; Hogan, S. (Solar Energy Research Institute, Golden, CO). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Reliability;* **R-31**: 271-275(Aug 1982).

20028 **Net energy analysis of methanol and ethanol production.** Perez-Blanco, H.; Hannon, B. (Oak Ridge National Lab, Oak Ridge, TN 37830 USA). *Energy (Oxford);* 7: No. 3, 267-280(1982).

The production processes and end uses are analyzed for fuel-grade EtOH and MeOH to assess the potential energy savings introduced by alcohol production from renewable feedstock. Whereas MeOH production from wood brings about energy savings, EtOH production from corn may or may not save energy depending on the end use of the alcohol. If the alcohol is used as a motor fuel, no overall energy savings are found.

20029 **(CNES—81/CT/PRT/SST/SM/178) Modal analysis of structures with prestress effects: application to flexible solar generators.** Boissin, B. (Centre National d'Etudes Spatiales, 31 - Toulouse (France)). May 1981. 76p. (In French). NTIS, PC A05/MF A01.

A model of the dynamic behavior of a flexible solar array which is part of a satellite-borne solar generator for spacecraft power supply (4 to 10kW) is presented. Results are appropriate for solving problems of spacecraft attitude control. The array is depicted as a skin covered by solar cells. Modal characterization of prestressed structures is explained for the calculation of differential rigidity. The method is demonstrated for a beam loaded at each end and for a square plate loaded along two opposite sides. Results for an array which is deployed along a telescoping mast are shown. (ESA)

20030 **Biomass: source of tomorrow's chemicals.** Lipinsky, E.S. (Battelle, Columbus Lab, Columbus, OH 43201, USA). pp 69-82 of Cereals; Renewable Resource, Theory and Practice. Pomeranz, Y.; Munck, L. St. Paul, MN; American Association of Cereal Chemists (1981).

A review is presented of chemicals and fuels manufactured from biomass. (Refs. 17).

1406 Photovoltaic Power Systems

REFER ALSO TO CITATION(S) 20020

20031 **(ANL/NESC—937) SOLCEL2; simulation of photovoltaic systems.** Hoover, E.R.; Linn, J.K. (Sandia National Labs., Albuquerque, NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048937.

The logic for energy flow is fixed. The system's annual performance is assumed to be constant over its economic lifetime.

SOLCEL2 was developed as a system analysis tool for performing studies to identify and evaluate by hour-by-hour simulation promising photovoltaic (PV) applications. Made up of a collection of component model subroutines linked by an executive routine, SOLCEL2 allows the user to model a variety of system configurations with a minimum number of input variables. Hourly weather data and an hourly electrical load profile (unless the utility mode of operation is specified) for an entire year are required as input. Twelve different array orientation schemes are provided. The three basic types of collectors modeled are flat-plate, linear-focus concentrator, and point-focus concentrator. Each of the three types has three options for cell cooling. Four different methods of modeling the photovoltaic conversion process are available including maximum power tracking, floating battery, voltage regulator, and temperature-degraded efficiency. The first three methods use a detailed solar cell model while the fourth uses a very simple temperature-corrected efficiency model.CDC6600,7600,CYBER175; SOLCEL2 is written primarily in ANSI FORTRAN.; NOS (CDC6600,CYBER175) and SCOPE 2.1 (CDC7600); 70,000 (octal) words of central memory are required to execute the program.

20032 **(BMFT-FB-T—81-082) Energy storage systems for terrestrial solar generators. Final report, Dec. 1980.** Jung, M. (Varta Batterie A.G., Kelkheim (Germany, F.R.). Forschungs- und Entwicklungszentrum). May 1981. 76p. (In several languages). NTIS, PC A05/MF A01.

Mercury can react with Raney nickel to form the alloy $NiHg_4$. This intermetallic compound is the basis of an excellently rechargeable positive electrode material. In combination with cadmium it forms a rechargeable cadmium/mercury oxide cell which can be operated under hermetically sealed conditions. Since both electrodes are thermodynamically stable in aqueous alkaline electrolytes, the self discharge rate of the cell is very low and hence the Coulomb efficiency even at very low charge rates in the order of 1000 - 2000 hrs. is higher than 95%. The cadmium/mercury oxide cells can be cycled more than a hundred times. These cells are particularly qualified to serve as an energy storage in combination with photovoltaic cells.

20033 **(DOE/CS/24280—2) Photovoltaic concentrator application experiment. Final report.** Brink, D.; Lowe, W.; Maraschin, R.; Masters, W.; Van Ekelenburg, A.; Wong, V. (Acurex Corp., Mountain View, CA (USA). Alternate Energy Div.). May 1980. Contract AC04-78CS24280. 215p. NTIS, PC A10/MF A01. Order Number DE83008109.

The detailed design has been completed of a 75 kWe photovoltaic energy system to supply both electricity and hot water for a hospital in the Hawaiian Islands. The application selected for this experiment, the system design, two actively cooled concentrating array designs, and projected system performance are described.

20034 **(DOE/ET/20279—177) Natural Bridges National Monument photovoltaic power plant: maintenance manual.** Solman, F.J.; Baird, R.H. (eds.). (Massachusetts Inst. of Tech., Lexington (USA). Lincoln Lab.). Feb 1982. Contract AC02-76ET20279. 428p. NTIS, PC A19/MF A01. Order Number DE83008294.

An overview is provided of the operation of the system as well as detailed discussions of the various subsystems. These include the automatic control system hardware and software as well as signal conditioning instrumentation and array control equipment.

20035 **(DOE/ET/20279—219) Photovoltaic-system evaluation at the Northeast Residential Experiment Station. Final report, November 1980-May 1982.** Russell, M.C. (Massachusetts Inst. of Tech., Lexington (USA). Lincoln Lab.). Jan 1983. Contract AC02-76ET20279. 163p. NTIS, PC A08/MF A01. Order Number DE83008259.

Residential photovoltaic systems have been under evaluation by Massachusetts Institute of Technology Lincoln Laboratory since late 1980. At the Northeast Residential Experiment Station in Concord, Massachusetts, five residential photovoltaic systems have undergone a comprehensive testing program designed to evaluate the systems' performance and cost. Results of this activity are presented. The five systems each consist of an unoccupied structure employing a roof-mounted photovoltaic array and a utility-connected power inverter capable of sending excess PV generated energy to the local utility system. The photovoltaic systems are designed to meet at least 50% of the total annual electrical demand of residences in the cold-climate regions of the country. Investigation included these specific issues: photovoltaic array and inverter system power rating and performance characterization, system energy production, reliability and system cost/worth. In addition, summary load data from five houses in the vicinity of the Northeast Residential Experiment Station, and meteorological data from the station's weather station are also presented.

20036 **(DOE/ET/20279—221) Effects on the utility feeder of utility-interactive inverters at the Northeast Residential Experiment Station.** Shelton, P.S.; Solman, F.J.; Nichols, B.E. (Massachusetts Inst. of Tech., Lexington (USA). Lincoln Lab.). Jan 1983. Contract AC02-76ET20279. 41p. NTIS, PC A03/MF A01. Order Number DE83007476.

The utility feeder for the Northeast Residential Experiment Station (NE RES) in Concord, MA, is a 2.4/4.16-kV circuit from the Concord Municipal Light Plant. The line was modeled analytically to predict the effects of loads and injected photovoltaic (PV) power applied at the NE RES. Measurements were made with instrumentation installed on the feeder near the substation and at the NE RES. The effects were compared with predictions. Measurements of ambient harmonic voltage and currents were made near the substation.

20037 (DOE/ET/20279—235) **Solarex final report: design and fabrication of a prototype system for a photovoltaic residence in the Southwest.** Gibson, R. (Solarex Corp., Rockville, MD (USA)). Nov 1982. Contract AC02-76ET20279. 95p. NTIS, PC A05/MF A01. Order Number DE83008128.

This project consisted of the design of an energy-efficient, photovoltaic, single-family residence suitable for construction in the Southwest and the fabrication and testing of a Prototype System based on that residence design. The Prototype, constructed at the Southwest Residential Experiment Station in Las Cruces, New Mexico, contains the power conditioning unit, test equipment, and load simulation equipment. The standoff photovoltaic array, consisting of 78 Solarex Powerline series modules, produces 5-kilowatts peak. The photovoltaic system is connected to the utility.

20038 (DOE/ET/20279—238) **ARCO Solar final report: fabrication of a prototype system for residences in the Southwest.** Yenamandra, R.; Schuetz, P. (ARCO Solar, Inc., Chatsworth, CA (USA)). Dec 1982. Contract AC02-76ET20279. 88p. NTIS, PC A05/MF A01. Order Number DE83008260.

A 7.4-kWp photovoltaic system was designed for an energy-conservative structure. The design of this house and construction of the photovoltaic portions, referred to as the Prototype System, is described. The problems and solutions addressed during the design and construction of the Prototype System are discussed.

20039 (N—82-25966) **Differential charging model of solar panels.** Maassberg, H.; Isensee, U. (Technische Hochschule Darmstadt (Germany, F.R.)). Feb 1982. 9p. NTIS, PC A04/MF A01.

In ESA GIOTTO Spacecraft Gas and Plasma Environ. p 25-33 (SEE N82-25962 16-75) REFS.

Two-dimensional (cylindrically symmetric thick sheath approximation) and three dimensional (spherically symmetric) models of Giotto solar panel charging are presented. An element of the quartz layer on the panels is regarded as a capacitor with a fixed potential at one plate, representing the floating potential of the inner structure of the spacecraft. This capacitor is charged by the current density of photoelectrons and by plasma electrons leaving or striking the surface. The charging equation can be integrated numerically, using the current densities of the photoelectrons and ambient plasma electrons. An iterative procedure is employed in order to satisfy the boundary value of the surface potential on solar panels. Results are similar for both models, with differences occuring only on the sunlit side of the panels. Near the comet nucleus, differential charging of 10V is predicted. Plasma analyzer functioning will not be affected by this charging.

20040 (N—8228349) **Analytical modeling of spacecraft power systems. Final Report, July 1981-April 1982.** Cassinelli, J. (TRW, Inc., Redondo Beach, CA (USA)). Apr 1982. 170p. (NASA-CR—166820). NTIS, PC A08/MF A01.

Power system components are reviewed. Battery and solar array models are discussed. Shunt regulators, dc-dc converters, and cabling are also discussed.

20041 (NASA-CR—165323-VOL-1) **Study of multimegawatt technology needs for photovoltaic space power systems. Volume 1: executive summary.** Peterson, D.M.; Pleasant, R.L. (General Dynamics/Convair, San Diego, CA (USA)). Aug 1981. 28p. NTIS, PC A03/MF A01.

Possible missions requiring multimegawatt photovoltaic space power systems in the 1990's time frame and associated power system technology needs are examined. The following concepts for photovoltaic power approaches are considered: planar arrays, concentrating arrays, hybrid systems using Rankine engines, thermophotovoltaic and AC/DC power management approaches, battery, fuel cell, flywheel energy storage, and interactions with the electrical ion engine injection and stationkeeping system. The levels of modularity for efficient, safe, constructable, serviceable, and cost effective system design are analyzed, and the benefits of alternate approaches developed. Both manned low Earth orbit and unmanned geosynchronous Earth orbit applications were examined for technological development. Technology developments applicable to power systems which appear to have benefits independent of the absolute power level are suggested.

20042 (NASA-CR—165323-VOL-2) **Study of multimegawatt technology needs for photovoltaic space power systems, volume 2. Final report.** Peterson, D.M.; Pleasant, R.L. (General Dynamics/Convair, San Diego, CA (USA)). Mar 1981. 285p. NTIS, PC A13/MF A01.

Possible missions requiring multimegawatt photovoltaic space power systems in the 1990's time frame and power system technology needs associated with these missions are examined. Four specific task areas were considered: (1) missions requiring power in the 1-10 megawatt average power region (2) alternative power systems and component technologies (3) technology goals and sensitivity trades and analyses and (4) technology recommendations. Specific concepts for photovoltaic power approaches considered were: planar arrays, concentrating arrays, hybrid systems using Rankine engines, thermophotovoltaic approaches all with various photovoltaic cell component technologies. Various AC/DC power management approaches, and battery, fuel cell, and flywheel energy storage concepts are evaluated. Interactions with the electrical ion engine injection and stationkeeping system are also considered.

20043 (NASA-TM—58237-VOL-4) **Satellite power system: concept development and evaluation program. Volume 4: energy conversion and power management.** (National Aeronautics and Space Administration, Huntsville, AL (USA). George C. Marshall Space Flight Center). Nov 1981. 369p. NTIS, PC A16/MF A01.

Additional analyses that were performed to supplement the NASA/Department of Energy (DOE) Satellite Power System (SPS) reference system concept are presented in this volume. A brief review of the reference concept is provided together with detailed descriptions of energy conversion, power distribution, and power management for solar photovoltaics (silicon and gallium arsenide), solar thermal (Brayton and Rankine cycles), and concept comparisons (solar thermal and energy conversion). Results of other studies concerning energy conversion and power management (environmental impacts, annealing, nuclear SPS concept, and thermionic) are included.

20044 (NASA-TM—58238-VOL-7) **Satellite power system: concept development and evaluation program. Volume 7: space transportation.** (National Aeronautics and Space Administration, Huntsville, AL (USA). George C. Marshall Space Flight Center). Nov 1981. 258p. NTIS, PC A12/MF A01.

During the several phases of the Satellite Power System (SPS) Concept Definition Study, various transportation system elements were synthesized and evaluated on the basis of their potential to satisfy overall SPS transportation requirements and their sensitivities, interfaces, and impact on the SPS. Additional analyses and investigations were conducted to further define transportation system concepts that will be needed for the developmental and operational phases of an SPS program. To accomplish these objectives, transportation systems such as the Shuttle and its derivatives have been identified new heavy-lift launch vehicle (HLLV) concepts, cargo and personnel orbital transfer vehicles (COTV and POTV), and intra-orbit transfer vehicle (IOTV) concepts have been evaluated, and, to a limited degree, the program implications of their operations and costs were assessed. The results of these analyses have been integrated into other elements of the overall SPS concept definition studies.

20045 (PML—1980-06) **Solar power systems smaller than 500 W for military use.** Wittgen, P.P.M.M. (Prins Maurits Lab. TNO, Rijswijk (Netherlands)). Nov 1979. 27p. (In several languages). NTIS, PC A03/MF A01.

A literature search of the feasibility of using photovoltaic cells for the energy supply of low power-consuming military equipment is presented. Progress in the technology of solar cells in the coming years offers good prospects for the use of photovoltaic systems. A hybrid system consisting of an array of solar cells combined with secondary batteries in a sunny climate is capable of supplying equipment with energy. Climatic conditions in the Netherlands and the northern part of Germany are too bad for a fully self-supporting year round system. Especially in winter the intensity and quantity of the radiation is too low. In these northern regions the hybrid solar system can only be used when additional primary or secondary batteries are accepted in the winter period.

20046 **(SAND—82-1790C) PV concentrator array power costs.** Maish, A.B. (Sandia National Labs., Albuquerque, NM (USA)). 1983. Contract AC04-76DP00789. 7p. (CONF-830405—2). NTIS, PC A02/MF A01. Order Number DE83002518.

From 6. annual ASME technical conference on commercial building heating and cooling applications; Orlando, FL, USA (19 Apr 1983).

Photovoltaic concentrator array installed costs per adjusted peak watt (W/sub ap/) have been developed for three leading tracking structure designs using current and expected concentrator module performance. Total installed costs are presented for the arrays for $10^5 m^2$/y production and 500 kW/sub p/ field sizes. Array field annual performance and power costs are developed as a function of array spacing using the results of a detailed computer performance code which includes the effects of array shading, series/parallel wiring, bypass diode, maximum power tracking, and PCU voltage limitations. Results indicate installed costs of the three arrays are within 10% of each other. Installed power costs are relatively insensitive to array spacing and are approximately $4/W/sub ap/ with current technology and can be expected to drop to $3 to $3.50/W/sub ap/ with array cost reductions and cell efficiency improvements.

20047 **(SAND—82-7152) User's guide to SOLREL: a simulation of reliability and availability of photovoltaic systems.** Stember, L.H.; Huss, W.R. (Battelle Columbus Labs., OH (USA)). Jan 1983. Contract AC04-76DP00789. 105p. NTIS, PC A06/MF A01. Order Number DE83007581.

SOLREL is a computer-based simulation for analyzing the reliability and availability of PV systems. It provides a tool to model their functional behavior and the effects of component and system reliability. It will also predict annual maintenance costs and the annual production of power for photovoltaic power systems, allowing for failures and degradation. These effects are measured by the resulting change in life cycle costs or life-cycle energy costs. The Guide's contents are as follows: Chapter I summarizes problems SOLREL can address and provides a description of the potential impact and use of the model; Chapter II gives an overview of the modeling approach, including how it incorporates degradation, failures and repairs; Sample outputs from SOLREL are also included in this chapter. Chapters III and IV present results of the application of SOLREL to a commercial concentrator and a residential flat panel PV system; Chapter V discusses the use of SOLREL in sensitivity analysesl; Several approaches to testing various design alternatives are given. Appendix A provides format information to guide the preparation of input data. Appendix B is a comprehensive, annotated listing of the SOLREL software for a flat panel system. This permits the analyst to follow through the computer program step-by-step, if desired.

20048 **(SAND—83-0155C) New designs and installations of photovoltaic-array fields with low balance-of-system costs.** Post, H.N.; Burgess, E.L. (Sandia National Labs., Albuquerque, NM (USA)). 1983. Contract AC04-76DP00789. 9p. (CONF-830213—2). NTIS, PC A02/MF A01. Order Number DE83006292.

From 10. energy technology conference; Washington, DC, USA (28 Feb 1983).

The design, development, and prototype installation of low-cost, modular array fields for flat-plate photovoltaic (PV) systems are described. Key features of the array field balance-of-system (BOS) components including structures, foundations, intermodule connection, field wiring, and system grounding are identified. Cost projections for the two alternative building-block array-field designs which have been developed show a significant reduction in the BOS costs compared to that experienced in previous PV installations. Prototype array fields of each design have been installed in the Sandia Test Facility.

20049 **The U.S. National Photovoltaic Program.** Magid, L.M.; Maycock, P.D. (U.S. Dept. of Energy, Div. of Distributed Solar Tech., Washington, DC). *Conference Record of the IEEE (Institute of Electrical and Electronics Engineers) Photovoltaic Specialists Conference;* 887-892(1980). (CONF-800106—).

The Photovoltaic Energy System Program proposed by the United States Department of Energy is discussed with reference to the program strategy and goals, major elements, and management. A key element in this program is the expectation that photovoltaic residences will begin to be cost effective within the Southwestern United States when modules are priced at 70 cents/peak watt and the total installed system costs from $1.6 to $2.20 per peak watt (in 1980 dollars). The program anticipates this occurring in 1986.

1407 Solar Thermal Power Systems

REFER ALSO TO CITATION(S) 19971, 19972, 20090, 20090, 20119, 20136, 20138

20050 **(BMFT-FB-T—81-097) Gas cooled solar power plant for generating electrical enetgy in the 20MWe operating range (GAST): preliminary design phase. final report, nov. 1980.** Kostrzewa, S.; Wehowsky, P. (Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.)). Jul 1981. 33p. (In several languages). NTIS, PC A03/MF A01.

R D work required for the erection of a pilot plant was defined. Since the location of the site is not yet determined, the project work was based on preliminary basic data. Significant results of the preliminary design phase include both the choice of a combined gas/steam thermal energy conversion process for the reference concept and basic concepts for heliostat, heliostat field arrangement, receiver, tower and master control/process computer system.

20051 **(BMFT-FB-T—81-101) Development of a prototype of a 10 kw small solar power plant. Final report, Sep. 1979.** Maier, F.; Haenfling, J. (Dornier-System G.m.b.H., Friedrichshafen (Germany, F.R.)). Jun 1981. 170p. (In several languages). NTIS, PC A08/MF A01.

Activities performed in the design and construction of a solar driven 10 kW turbogenerator for local TV-educational systems, irrigation pumps and other applications in developing countries include: (1) System design and thermodynamic calculation (2) Design of the collector array and construction (3) Fixing of components and auxiliary units (4) Turbine design, construction, manufacture and test run (5) Generator design, construction, manufacture and test run (6) Turbogenerator integration and test (7) Electrical supply, plant control and regulation and (8) Test assembly, performance and analysis. Component tests are being run and are being evaluated by a data acquisition unit installed on site.

20052 **(BMFT-FB-T—81-154) Organic fluids for the practical use in energy conversion systems of solar power plants. Final report, Jun. 1980.** Schmidt, G.; Wolf, D.; Raasch, E. (Messerschmitt-Boelkow-Blohm G.m.b.H., Ottobrunn (Germany, F.R.)). Sep 1981. 76p. (In several languages). NTIS, PC A05/MF A01.

With respect to their specific performance, the most promising organic fluids were determined for their practical use in Rankine cycles operating in the temperature range between 150 and 400 C. For these fluids, the process cycle efficiencies were compared for different temperature levels. Laboratory experiments with a great number of fluids and lubricants results in the estimation of the operation limit in Rankine Cycles. A test facility consisting of a heating system, an organic Rankine cycle and a control and measurement system was designed, built, and put into operation for testing various working fluids.

20053 (BMFT-FBT—81-119) **Development of a simple water pump driven with solar energy. Final report.** Schneller, D.; Speidel, K. (Dornier-System G.m.b.H., Friedrichshafen (Germany, F.R.)). Aug 1981. 48p. (In several languages). NTIS, PC A03/MF A01.

A piston engine, a solar collector with direct evaporation, and a processing plant were developed and constructed. The water pump worked satisfactorily under three months of European weather conditions. A total efficiency of 2.5% was reached (efficiency being defined as hydraulic output/solar energy input on installed collector field). The pump is intended to meet the water requirements of small village communities.

20054 (CEA-CONF—6248) **Construction of a 100 kW solar thermal-electric experimental plant.** Boy-Marcotte, J.L.; Dancette, M.; Bliaux, J.; Bacconnet, E.; Malherbe, J. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France)). Apr 1982. 7p. (CONF-820410—10). Dep. NTIS (US Sales Only), MF A01. Order Number DE83901343.

From ASME solar energy conference; Albuquerque, NM, USA (26 Apr 1982).

A focussing collector thermal-electric power plant has just been erected in Corsica (France). This plant consists of a field of 1176 m fixed mirror concentrators, producing heat at 250C, a stratification thermal energy storage of about 1250 kWh, two power conversion units of 45 kWe each, with a supersonic turbine expanding a heavy organic working fluid, and two cooling towers of 200 kW each. This full-scale prototype has been built mainly in order to demonstrate the interest of the distributed collector solar plant concept, in the power range from 50 kWe to 1000 kWe, and the temperature range from 150 to 300C. This paper describes the conceptual design and the performances of the plant, and discusses problems which were met during construction

20055 (DOE/AL/19929—T7) **Section 210 of PURPA and solar-thermal-energy development: the current regulatory environment and suggestions for future action. Task III report.** (Nossaman-Krueger and Knox, Washington, DC (USA)). Jan 1983. Contract AC04-82AL19929. 103p. NTIS MF A01. Order Number DE83006992.

Section 210 of the Public Utility Regulatory Policies Act of 1978 (PURPA) (16 U.S.C. Section 824a-3) (Attachment 1) was enacted to overcome certain institutional barriers and to provide a favorable, non-discriminatory regulatory environment for the integration of electricity-producing solar thermal and other qualifying technologies into the electric utility network. PURPA Section 210 is designed to reduce these institutional barriers for qualifying cogeneration and small power production facilities (QF's) - terminology which includes solar thermal facilities producing electricity for sale, if other prerequisites are met - by exempting certain QF's from economically burdensome legal requirements applicable to electric utilities, and by requiring utilities to offer to purchase electricity from, and sell electricity to, QF's at reasonable and non-discriminatory rates. The present and future PURPA Section 210 regulatory implications for solar thermal QF's are explored. The current PURPA Section 210 regulatory environment and its consequences for solar thermal energy development are outlined. Legislation pending before Congress to amend PURPA Section 210 is described. Possible amendments to PURPA Section 210 that might further stimulate construction and operation of economically sound solar thermal facilities are explored.

20056 (DOE/JPL—1060-52) **Parabolic-dish solar-thermal power annual program review.** (Jet Propulsion Lab., Pasadena, CA (USA)). 15 Jul 1982. Contract AT04-81AL16228. 350p. (JPL-PUBL—82-66; CONF-811261—). NTIS, PC A15/MF A01. Order Number DE83000474.

Separate abstracts were prepared for 24 papers in this conference proceedings. (LEW)

20057 (DOE/JPL—1060-52, pp 49-52) **Small community solar thermal power experiment.** Kiceniuk, T. (Jet Propulsion Lab., Pasadena, CA). 15 Jul 1982. NTIS, PC A15/MF A01.

From Parabolic dish solar thermal power annual program review; Atlanta, GA, USA (8 Dec 1981).

The status of the small Community Solar Thermal Power Experiment is reviewed. The plant size has been reduced to 25 kW from an original capacity of 5 MW. Because of the modular nature of the parabolic dish, distributed-generation, Rankine system, changes in plant size have only a secondary effect on plant design. Another advantage to the modular scheme is that fully automated operation is virtually intrinsic to its conception, with each module capable of performing several tasks independently. The status of hardware and performance testing is described, as well as site-related activities. (LEW)

20058 (DOE/JPL—1060-52, pp 53-99) **Development status of the small community solar power system.** Pons, R.L. (Ford Aerospace & Communications Corp., Newport Beach, CA). 15 Jul 1982. NTIS, PC A15/MF A01.

The development status and test results for the Small Community Solar Thermal Power Experiment (SCSE Program) are presented. Current activities on the Phase II power module development effort are presented with emphasis on the receiver, the plant control subsystem and the energy transport subsystem.

20059 (DOE/JPL—1060-52, pp 101-113) **Organic Rankine power conversion subsystem development for the small community solar thermal power system.** Barber, R.E. (Barber-Nichols Engineering Co., Arvada, CA); Boda, F.P. 15 Jul 1982. NTIS, PC A15/MF A01.

From Parabolic dish solar thermal power annual program review; Atlanta, GA, USA (8 Dec 1981).

The development and preliminary test results are described for an air-cooled, hermetically-sealed 20 kW/sub e/ organic Rankine (ORC) cycle engine/alternator unit for use with Point Focussing Distributed Receiver (PFDR) solar thermal power systems. 750°F toluene is the working fluid and the system features a high speed, single-stage axial flow turbine direct-coupled to a Permanent Magnet Alternator (PMA). Good performance has been achieved with the unit in preliminary tests and testing is continuing.

20060 (DOE/JPL—1060-52, pp 123-145) **Recent tests on the Carter small reciprocating steam engines.** Kiceniuk, T.; Wingenbach, W. (Jet Propulsion Lab., Pasadena, CA). 15 Jul 1982. NTIS, PC A15/MF A01.

From Parabolic dish solar thermal power annual program review; Atlanta, GA, USA (8 Dec 1981).

A steam engine was tested with a fuel fired heat supply so as to characterize its performance under conditions similar to those which would be encountered in the Small Community Solar Thermal Power Experiment and to compare the results with performance predicted by computer simulations of the engine. Tests were conducted over a range of values of thermal input and steam temperature. Two tests were conducted at expansion ratios of 10/1, and one at expansion ratio of 14.4/1. The effect of temperature and power level variations was demonstrated. Engine efficiency was considered good although lower than projected by computer simulations. The effect of change in expansion ration was not demonstrated. One cylinder and two cylinder models were tested. each engine was then tested using steam generated in a solar receiver. (LEW)

20061 (DOE/JPL—1060-52, pp 147-177) **400-kW/sub e/ high-efficiency steam turbine for industrial cogeneration.** Leibowitz, H.M. (Mechanical Technology Inc., Latham, NY). 15 Jul 1982. NTIS, PC A15/MF A01.

From Parabolic dish solar thermal power annual program review; Atlanta, GA, USA (8 Dec 1981).

An advanced state-of-the-art steam turbine-generator has been developed to serve as the power conversion subsystem for the Solar Total-Energy Project in Shenandoah, Georgia. The turbine-generator, which is designed to provide 400-kW/sub e/ net electrical power, represents the largest turbine-generator that has thus far been built specifically for commercial solar-powered cogeneration. The controls for the turbine-generator incorporate a multiple, partial-arc entry to provide efficient off-design performance, as well as an extraction control scheme to permit extraction flow regulation while maintaining 110-psig pressure. Normal turbine operation is achieved while synchronized to a local utility and in a stand-alone mode. In both cases, the turbine-generator features automatic load control as well as remote start-up and shutdown capability. A four-stage, axial steam turbine rotates on a 42,450-rpm pinion to drive an 1800-rpm synchronous generator through a double-reduction gearbox. At the inlet throttle condition of 720°F, 700 psig, the turbine is designed to produce 400 kW/sub e/ and 2249 lb/hr of 110-psig extraction steam while consuming 8591 lb/hr of steam at the inlet throttle. In addition, the 6-psig exhaust steam is designed for use in an absorption chiller to provide 164 tons of plant air conditioning. The back-pressure turbine includes two high-pressure and two low-pressure stages separated by the 110-psig extraction port. Tests totaling 200 hours were conducted to confirm the integrity of the turbine's mechanical structure and control function. Performance tests resulted in a measured inlet throttle flow of 8450 lb/hr near design conditions. The successful completion of all structural, control and performance tests has produced a turbine-generator uniquely qualified for industrial cogeneration applications in the 500-hp class.

20062 (DOE/JPL—1060-52, pp 179-189) **Modifications and testing of a 4-95 Stirling engine for solar applications.** Nelving, H.G.; Percival, W.H. 15 Jul 1982. NTIS, PC A15/MF A01.

From Parabolic dish solar thermal power annual program review; Atlanta, GA, USA (8 Dec 1981).

A Stirling engine was modified by machining numerous holes and slots to form oil drain passages in the crankcase bulkheads and the gas compressor housing in order to provide adequate oil drain by gravity alone. The engine was then tested using helium working gas. After 130 hours of initial testing, the engine was performance tested for 25 hours, followed by 175 hours of endurance running. The engine was disassembled for inspection. Finally, tests were performed at the Advanced Components Test Facility, where record electrical power output was achieved and solar heat exchangers were tested successfully. (LEW)

20063 (DOE/JPL—1060-52, pp 191-200) **Dish Stirling system integration and test progress report.** Haglund, R.A. (Advanco Corp., El Segundo, CA). 15 Jul 1982. NTIS, PC A15/MF A01.

From Parabolic dish solar thermal power annual program review; Atlanta, GA, USA (8 Dec 1981).

The integration and check-out of the complete Dish Solar Stirling Thermal Power System at JPL's Parabolic Dish Test Site at Edwards Air Force Base, California is reported. The test program to demonstrate this full-up Dish Stirling Solar Thermal Electric System is well under way and the preliminary results of the tests conducted thus far are presented. The results are very encouraging and show promise of high performance and efficiency. The outstanding performance and durability of the 4-95 Stirling engine has been the highlight of this 6 month integration and test activity. Exposure to severe heat, dust, sand and wind during the summer months and heavy rains, high winds, inlcuding sand storms and freezing cold in recent months has not affected the engine or the receiver in any noticeable manner.

20064 (DOE/JPL—1060-52, pp 225-231) **French thermo-helio-electricity-kW parabolic dish program.** Audibert, M.; Peri, G. (Centre National de le Recherche Scintifique, Marseille, France). 15 Jul 1982. NTIS, PC A15/MF A01.

From Parabolic dish solar thermal power annual program review; Atlanta, GA, USA (8 Dec 1981).

The program reported aims to develop parabolic dish solar thermal power plants to produce thermal, mechanical, or electrical energy within the range of a few tens of thermal kW to some MW at a temperature up to 350°C. The design, construction, and experiments on two varients of laboratory prototype collectors to prove their feasibility are reported. Other efforts are reported that are aimed at starting industrialization of collectors and to design, build, and experience an installation featuring 10 collectors to produce process heat. Industrial applications are briefly discussed. (LEW)

20065 (DOE/JPL—1060-52, pp 257-282) **Garrett solar Brayton engine/generator status.** Anson, B. (Garrett Turbine Engine Co., Phoenix, AZ). 15 Jul 1982. NTIS, PC A15/MF A01.

From Parabolic dish solar thermal power annual program review; Atlanta, GA, USA (8 Dec 1981).

The solar advanced gas turbine (SAGT-1) is being developed for use in a Brayton cycle power conversion module. The engine is derived from the advanced gas turbine. The SAGT Program is presently funded for the design, fabrication and test of one engine. The engine, when mated with a solar receiver, is called a power conversion module (PCU). The PCU is scheduled to be tested on JPL's test bed concentrator under a follow-on phase of the program. Approximately 20 kW of electrical power will be generated.

20066 (DOE/JPL—1060-52, pp 283-293) **Application of the subatmospheric engine to solar thermal power.** 15 Jul 1982. NTIS, PC A15/MF A01.

From Parabolic dish solar thermal power annual program review; Atlanta, GA, USA (8 Dec 1981).

A natural gas-fired Brayton engine is described that is also a candidate for solar thermal power generation applications. The engine operates in a subatmospheric mode, that is, between atmospheric pressure and a partial vacuum. In the solar mode, the engine operates as a closed Brayton cycle engine referenced to ambient pressure through the open receiver. The designs of the turbocompressor, recuperator, and alternator, as well as advantages of this engine for simplifying the design of the solar receiver, are summarized. Engine power output and efficiency characteristics are predicted. (LEW)

20067 (DOE/JPL—1060-52, pp 319-328) **Configuration selection study for isolated loads using parabolic dish modules.** Revere, W.; Bowyer, J.; Fujita, T.; Awaya, H. (Jet Propulsion Lab., Pasadena, CA). 15 Jul 1982. NTIS, PC A15/MF A01.

From Parabolic dish solar thermal power annual program review; Atlanta, GA, USA (8 Dec 1981).

A configuration tradeoff study has been conducted to determine optimum solar thermal parabolic dish power systems for isolated load applications. The specific application of an essentially constant power demand as required for MX missile shelters is treated. Supplying a continuous level of power with high reliability is shown to require a power system comprising modular parabolic dish power units where the heat engines of the modular power units can be driven by fossil fuels as well as solar-derived heat. Since constraints on reliability result in the provision of a power generating capability that exceeds the constant demand level, efficient utilization of the power system requires battery storage. Tradeoffs regarding the optimum size of storage are investigated as a function of the number of power modules and the cost of the fossil fuel which is used to meet the demand when insolation is unavailable and storage is depleted.

20068 (SERI/TP—252-1775) **Evaluation of air-cooled central receivers.** Wright, J.D. (Solar Energy Research Inst., Golden, CO (USA)). Dec 1982. Contract AC02-77CH00178. 8p. (CONF-830405—5). NTIS, PC A02. Order Number DE83005130.

From 6. annual ASME technical conference on commercial building heating and cooling applications; Orlando, FL, USA (19 Apr 1983).

Air-cooled central receivers with metal tube absorbers are not competitive with other central receiver technologies. The cost of electricity produced by an air receiver operating at approximately 815°C (1500°F) coupled to a Brayton or combined cycle is 20 to 30% higher than that produced by draw salt or steam receivers coupled to steam Rankine power cycles. Similar results are found in cogeneration and industrial process heat applications. The higher cost and disadvantages of metal tube air-cooled receivers stem directly from the poor heat transfer characteristics of air and from the expensive metals required to fabricate the absorber tubes. Results of this study are used to define some of the requirements for higher temperature receivers to produce hot air.

20069 **(SERI/TR—251-1573) Research and development project evaluation and selection methods for the Solar-Thermal-Technology Program.** Krawiec, F. (Solar Energy Research Inst., Golden, CO (USA)). Feb 1983. Contract AC02-77CH00178. 58p. NTIS, PC A04/ MF A01. Order Number DE83008296.

The ranking of R and D options for long-term, high-payoff research and development in the Solar Thermal Technology Program is discussed considering the four general classes of ranking methods: economic, decision theory, constrained optimization, and scoring. The scoring method is proposed as the most suitable ranking technique to develop a balanced portfolio of R and D program elements. Procedure for implementation of the scoring method for Solar Thermal Technology Program activities evaluation and selection is outlined. Practical applicability of the scoring method to evaluate and select the Solar Thermal Research Program activities is demonstrated. The major conclusion is that the scoring method, augmented with the usbjective probabilistic risk assessment procedure, is the most suitable ranking technique to develop a balanced portfolio of R and D program elements.

20070 **Heat transfer from combustion gases to a single row of closely spaced tubes in a swirl crossflow Stirling engine heater.** Bankston, C.P.; Back, L.H. (Energy and Materials Research Section, Jet Propulsion Laboratory, California Institute of Technology, Pasadena, California 91109). *Journal of Heat Transfer;* **104**: No. 1, 55-75(Feb 1982).

This paper describes an experimental program to determine the heat-transfer characteristics of a combustor and heat-exchange system in a hybrid solar receiver which utilizes a Stirling engine. The system consists of a swirl conbustor with a crossflow heat exchanger composed of a single row of 48 closely spaced curved tubes. In the present study, heat-transfer characteristics of the combustor/heat-exchanger system without a Stirling engine have been studied over a range of operating conditions and output levels using water as the working fluid. Non-dimensional heat-transfer coefficients based on total heat transfer have been obtained and are compared with available literature data. The results show significantly enhanced heat transfer for the present geometry and test conditions. Also, heat transfer along the length of the tubes is found to vary, the effect depending upon test condition.

1408 Ocean Thermal Gradient And Salinity Gradient Power Systems

20071 **(CONF-820814—41) OTEC plants for today's island market.** Niemann, R.; Davis, F.; Genens, L.; Hillis, D.; Panchal, C.; Sather, N.; Stevens, H.; Thomas, A. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 7p. NTIS, PC A02/MF A01. Order Number DE83008670.

From 17. Intersociety Energy Conversion Engineering conference; Los Angeles, CA, USA (8 Aug 1982).

Conceptual designs, incorporating existing technology, have been developed to satisfy the needs of today's island market for small OTEC power plants. The plants, intended for commercial application to power-distribution grids, incorporate operating procedures, component lifetimes, plant reliability and availability, and safety features commensurate with established electric-utility standards. The OTEC closed-cycle process was selected and applied to the design of shore-based plants of 1-, 5-, and 10-MWe capacities. Concepts of the power system, seawater system, and the overall power plant facility are presented. Plant design considerations are enumerated. Also presented are initial cost estimates and construction schedules along with the plant operating costs and the related cost of electricity based on plant cost, availability, and prevailing economic conditions.

20072 **(DOE/ET/20480—T1) 100- and 400-MW(e) large-scale floating OTEC platform conceptual designs. Final report.** (Gibbs and Cox, Inc., Arlington, VA (USA)). Feb 1982. Contract AC02-78ET20480. 574p. NTIS, PC A24/MF A01. Order Number DE83007894.

The design and integration of large scale floating OTEC platforms capable of generating 100 and 400 MW of electrical power for transmission to a shoreside power grid is reported. The various trade-off studies that evaluated the different systems of the OTEC plant are documented, and the two resulting configurations are described. A ship hull platform was chosen, as opposed to a spar or fixed tower. The platforms, cold water pipes, power systems, seawater systems, auxiliary systems, energy transfer system, and position control subsystems are detailed individually. Plant construction and deployment are discussed, and cost estimates are given. Technical details are appended, including blueprints, weight estimates, and environmental data. (LEW)

20073 **(N—8228782) Projected engineering cost estimates for an Ocean Thermal Energy Conversion (OTEC).** Gritton, E.C.; Hess, R.W.; Pei, R.Y. (RAND Corp., Santa Monica, CA (USA)). Jan 1982. 19p. (RAND/N—1788-RC). NTIS, PC A02/MF A01.

The potential cost reductions that might be achieved if certain engineering, construction and financial improvements were realized in the ocean thermal energy conversion concept were investigated. Six options were analyzed: water-side heat transfer enhancement (for tube-and-shell heat exchangers), plate type heat exchangers, fiberglass reinforced plastic cold water pipes, elmination of the requirement that the transmission cable be buried at ocean depths of less than 300 feet, a shorter construction period, and a reduced fixed charge rate. It was found that the changes having the most effect on capital cost are the two heat exchanger options and the shorter construction period. However, to achieve major reductions in capital cost, say on the order of 30 percent, a combination of one of the heat exchanger options in conjunction with the cold-water pipe, transmission cable and construction period options will be required.

20074 **(NP—3901549) OTEC: status and potential of private funding.** Francis, E.J.; Richards, D. (Johns Hopkins Univ., Laurel, MD (USA). Applied Physics Lab.). 1982. 30p. NTIS, PC A03/MF A01. Order Number DE83901549.

A financial analysis approach is described for calculating net present values and financial management rates of return for a wide variety of specific OTEC cases. Comparisons are made of the profit potentials, expected market penetration, perceived financial risks, and eventual benefits from the specific cases and logical follow-on construction scenarios. The principal factors of uncertainty as perceived by researchers, builders, and financiers are catalogued. Roles and responsibilities of participants in a financing approach including builder team, government, product user, financial houses, and investors are cited. Cases which have been investigated include 10 to 40 MW/sub e/ scale and 250 to 360 MW/sub e/ scale OTEC plants and plantships; electric power cabled ashore to US islands and the US mainland, methanol, ammonia, hybrid geothermal-OTEC plants for meeting local power demands or making products; and relevant data on other OTEC product possibilities.

20075 **(NP—3901550) Conceptual designs of a 100- and 400-MW large-scale OTEC platform: an update.** Deuchler, W.P.; Picha, K.G. Jr.; Hudon, T.J. (Gibbs and Cox, Inc., Arlington, VA (USA)). 1981. 32p. NTIS, PC A03/MF A01. Order Number DE83901550.

Through extensive trade-off studies, designs for OTEC plants producing 100 MW and 400 MW of electrical power have been developed. The OTEC platforms represent a total system integration approach rather than a simple combining of individually optimized subsystems. Factors considered in integrating these systems included subsystem performance, risk and cost. Final cost estimates for the platform are listed. These costs and platform designs represent configurations favorably suited for the Hawaiian, Kahe Point, site and are not necessarily optimized for other OTEC sites. They do, however, represent reasonable data points for large-scale platforms in general and illustrate a reasonable economy of scale expected of platforms of increasing power output.

20076 (NP—3901554) Environmental research for facilitating OTEC commercialization. Myers, E.P. (National Oceanic and Atmospheric Administration, Washington, DC (USA). Office of Ocean Minerals and Energy). 1982. 21p. Office of Ocean Minerals and Energy, National Oceanic and Atmospheric Administration, Washington, DC 20235.

In August, 1980, the National Oceanic and Atmospheric Administration (NOAA) was given the responsibility, per the Ocean Thermal Energy Conversion Act of 1980 (P.L. 96-320), to establish a legal regime that would foster the commercialization of ocean thermal energy conversion (OTEC) in a manner that protects the marine environment. NOAA developed both an EIS and an environmental effects research plan in accord with the requirements of the Act. These efforts, coupled with an assessment of past OTEC environmental research, highlight the following topics as being of high research priority: direct licensing requirements, and effects on fisheries. Cost-effective and timely research on these topics will be supportive of OTEC commercialization.

20077 (NP—3901555) OTEC: the government framework for development. Norling, R.D. (National Oceanic and Atmospheric Administration, Washington, DC (USA). Office of Ocean Minerals and Energy). 1982. 14p. Dept. of Commerce, National Oceanic and Atmospheric Administration, Office of Ocean Minerals and Energy, Washington, DC 20235.

The Ocean Thermal Energy Conversion Act of 1980 sets forth the basic rules of the OTEC legal regime and thus addresses legal uncertainties that had previously menaced the development of a commercial OTEC industry. The act establishes US jurisdiction over OTEC facilities and establishes a federal licensing system. Legal protection is extended to submarine electric transmission cables and equipment. The act makes applicable to OTEC facilities and plantships the Constitution, laws, and treaties of the US and the laws of the sthate to which an OTEC facility is connected. Specific determinations regarding the applicability or inapplicability to OTEC plants of various provisions of law also exist. Implementation of the act by NOAA is discussed, as well as additional considerations that OTEC developers need to keep in mind. (LEW)

20078 (SERI/TP—252-1853) Flash evaporation from turbulent water jets. Bharathan, D.; Penney, T. (Solar Energy Research Inst., Golden, CO (USA)). Feb 1983. Contract AC02-77CH00178. 14p. (CONF-830301—8). NTIS, PC A02/MF A01. Order Number DE83007311.

From ASME-JSME thermal engineering joint conference; Honolulu, HI, USA (20 Mar 1983).

Results of an experimental investigation of flash evaporation from turbulent planar and axisymmetric water jets are reported. In the range of jet thicknesses tested, for planar jets, due to shattering, evaporation is found to be nearly independent of the jet thickness. Evaporation from the planar jets was found to be dependent on the initial level of turbulence in the water supply manifold. An approximate analysis to model the evaporation process based on the physical phenomena and experimental observations is outlined. Comparisons between the experimental data and analytical predictions of the liquid temperature variation along the jet are included. Use of screens in the water jet are shown to be effective for enhancing evaporation.

1409 Solar Thermal Utilization

REFER ALSO TO CITATION(S) 19972, 19974, 19976, 20124, 20142, 20193, 20894, 20902, 20909, 20925, 20928, 22760

20079 (AD-A—115464/0) Solar energy applications at Army Ammunition Plants. Technical report. Lowry, A.P.; Moy, S.M. (Army Armament Research and Development Command, Dover, NJ (USA). Large Caliber Weapon Systems Lab.). Jun 1982. 46p. (ARLCD-TR—81038). NTIS, PC A03/MF A01.

The Army Ammunition Plants (AAPs) use significant quantities of fossil fuels. To reduce dependence on these scarce, costly, and non-renewable fuels, a study was conducted to investigate potential solar energy applications at the AAPs. Solar energy is a low-level energy source which is best applied to low temperature applications. It can be used at the AAPs to preheat boiler feedwater, provide hot air for dry-houses, provide domestic hot water and heat for administration buildings, and provide hot water for manufacturing processes such as metal cleaning, phosphating, and x-ray film processing. Use of flat plate collectors, evacuated tube collectors, or solar ponds with the possible addition of a heat pump, offers reasonably economical means of applying solar technology to AAP needs.

20080 (ANL/NESC—850) PASOLE; simulation of passive solar systems. McFarland, R.D. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048850.

Maxima of - 50 nodes 100 connections 1 control node Phase change storage is treated by use of temperature-dependent heat capacity. It is not convenient to handle heat-of-fusion as an isothermal enthalpy change. Internal reflections are not taken into account. For simulations in the southern hemisphere, changes to the solar angle and time equations are required. There are no restrictions on initial temperature conditions, but a small heat balance error will be observed if the initial temperatures are not in equilibrium.

PASOLE is a general simulation program for analyzing thermal performance of passive-solar heated buildings. Modeling is done using a general thermal network method that allows for heat sources and thermal storage. PASOLE can also be used to simulate hybrid or active solar heating systems. The user describes the thermal network model by specifying nodes that represent finite regions, connections between these nodes, and parameters associated with the nodes and connections. Sun position equations are used with a global-to-direct solar radiation correlation to develop solar heat sources from measured insolation data. The program includes built-in models of water-wall and masonry-wall versions of south-mass-wall type passive systems.CDC6600,7600;IBM360,370,3033; FORTRAN IV; NOS SCOPE (CDC6600), LTSS SCOPE(CDC7600), and OS/360(IBM360); PASOLE requires 110,000 (octal) words of program storage on a CDC6600, 60,000 (octal) words of program storage on a CDC7600, and 150K bytes of memory on an IBM3033.

20081 (ANL/NESC—907) SOLCOST3.0; solar heating & cooling design. Lantz, L.J. (Solar Environmental Engineering Co., Inc., Fort Collins, CO (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048907.

The SOLCOST solar energy design program is intended for sizing and evaluating several types of solar systems for residential and single-zone commercial buildings including service hot water and space heating systems using liquid or air collectors. Other systems incorporating heat pumps and absorption cooling are also available but are still being validated. The SOLCOST program computes an optimum solar collector area and tilt angle from an analysis of life cycle cost differences for a solar system versus a reference (conventional) HVAC system. This computation utilizes historical solar radiation and weather data for 336 cities to perform one day long computation for each month of the year. The program predicts the annual fraction of heating or cooling load provided by the solar system, the optimum collector area and tilt angle for the installation, and a detailed cash flow summary including payback and rate of return for the optimum collector area.CDC CYBER172,175; FORTRAN IV; NOS 1.3; 74,000 (octal) words of memory are needed to execute SOLCOST. The interactive input program requires 115,000 (octal) words of memory. However, by using the auxiliary subroutines included in the package, the interactive input program can be reduced to 65,000 (octal) words of memory.

20082 (BMFT-FB-T—81-164) The MIT Abu El Kom solar demonstration project in Egypt. Phase a: solar thermal installations. Final report, Mar. 1980. Reinmuth, F. (Kraftanlagen A.G., Heidelberg (Germany, F.R.)). Sep 1981. 71p. (In several languages). NTIS, PC A04/MF A01.

Maintenance-free solar installations were tested under unfavorable operating conditions in a village in Egypt. Thirty-five simple domestic hot water installations, designed as natural circulation systems of a collector surface of 2 sqm each and a 120 liter boiler mounted on the roof were examined. These installations were completely mounted and commissioned. The performance and efficiency of the systems were satisfactory.

20083 (BMFT-FB-T—81-165) **Comparison of concepts for solar-heated or solar-driven absorption and compression cooling machines for air conditioning and food preservation purposes, phase 1. Final report, Nov. 1978.** Grallert, H.; Herbricht, M.; Margulies, M. (Messerschmitt-Boelkow-Blohm G.m.b.H., Ottobrunn (Germany, F.R.)). Sep 1981. 91p. NTIS, PC A05/MF A01.

For the cooling power range of about 10 to 500 kW and for cooling temperatures of +20, 0, and -20 C, a comparison was made between solar heated absorption machines and compression machines, which are driven by a solar heated Rankine cycle. Comparison criteria are C.O.P., energy prices, and application risks. All partial efficiencies and costs were determinated by component analyses. For several cooling loads an annual system simulation was performed using MBB computer programs. Furthermore, the electric energy demand for absorption cooling systems was estimated and initial application recommendations are given.

20084 (CONF-811034—2) **Operational results of National Solar Demonstration Projects.** Waite, E.V. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 8p. NTIS (US Sales Only). Order Number DE83007647.

From 2. national technical conference on earth sheltered buildings; Tulsa, OK, USA (16 Oct 1981).

Included in the National Solar Demonstration Program are examples of earth-sheltered, passive solar designs. The data obtained from these sites presents an interesting look at what is both technically and economically feasible. Data from four demonstration sites that are members of the National Solar Data Network are utilized to present an economic and technical analyses of a group of four sites. Three of these sites are earth sheltered residential structures, the fourth is a commercial passive structure. This sample of four demonstration sites is not intended to provide a statistical representation of passive earth sheltered structures, but rather, an example of the type of information available through the National Solar Data Program and how this information may be utilized.

20085 (CONF-821101—20) **Comparison of three years of performance for air-to-air parallel solar-heat-pump system in TECH House IV.** Reid, R.L.; Bedinger, A.F.G.; McGraw, B.A. (Tennessee Univ., Knoxville (USA)). 1982. 6p. Univ. of Tennessee, Mechanical and Aerospace Engineering Dept., Knoxville.

From ASME winter annual meeting; Phoenix, AZ, USA (14 Nov 1982).

A parallel solar-augmented heat-pump system has been experimentally evaluated in TECH House IV for three heating seasons between fall 1979 and spring 1982. Several changes were made in the operation of the system during the three year period. During 1979-1980, the use of on-peak purchased energy was minimized by charging the pebble bin in the off-peak period with a resistance duct heater. This configuration resulted in 83% of the purchased energy occurring in the off-peak period but the seasonal performance factor was only 1.61. During 1980-1981, the system was operated in the normal mode without the use of the off-peak heater. The seasonal performance factor then increased to 2.56. During 1981-1982, the mode of operation was the same as 1980-1981, but new outer cover sheets were installed and the inner cover sheet was eliminated resulting in a single glazed collector. The seasonal performance factor for the 1981-1982 season was measured to be 2.11.

20086 (DOE/AL/20601—T1) **Capitol Concrete Solar Industrial Process Heat Experiment. Final technical report, May 30-November 24, 1982.** Hauger, J.S.; Pond, S.L. (Applied Concepts Corp., Woodstock, VA (USA)). 31 Jan 1983. Contract AC04-82AL20601. 94p. NTIS, PC A05/MF A01. Order Number DE83007189.

The nation's first point focussing solar industrial process heat plant was designed, installed, and operated for evaluation at Capitol Concrete Products. The solar collector, which was designed and fabricated by PKI, was incorporated into a plant to provide steam for curing concrete blocks in an autoclave at pressures of 15 to 60 psig. The plant was operated for a four month period of technical evaluation (July 26-November 24, 1982), subsequent to final check out testing.

20087 (DOE/CS/30007—T1) **Solar preheating of both domestic hot water and space. Final technical report for the Sea Loft restaurant in Long Branch, New Jersey.** (Sea Loft Restaurant, Long Branch, NJ (USA)). 28 Nov 1982. Contract FC01-77CS30007. 97p. NTIS (US Sales Only). Order Number DE83004719.

Stephen Giddio's Sea Loft Restaurant in Long Branch, NJ is equipped with an active solar system for preheating water for both space heating and domestic hot water. Three pumped water loops, each a closed circuit, transfer heat from one major component to another. Solar heat is collected by an array of 83 evacuated tube collectors. The acceptance test results are appended, as well as the operational and maintenance manual. Reference CAPE-2805. (LEW)

20088 (DOE/ID/12341—T1) **Vacuum distillation of fuel alcohol using solar energy. Final report.** Holden, M.L.; Smith, T.F. (Iowa Univ., Iowa City (USA). Div. of Energy Engineering). 30 Nov 1982. Contract FG07-81ID12341. 117p. NTIS, PC A06/MF A01. Order Number DE83008249.

Solar assisted distillation of ethanol fuel is examined by building, calibrating, and operating a pilot plant. First, the pilot plant was desingned and built with the components of solar collector, thermal energy storage tank, distillation unit, and data acquisition and control systems. Next, the instruments and control loops were calibrated to ensure accurate and repeatable measurements. Finally, experiments using solar energy and electric energy determined technical performance and feasibility of solar assisted distillation. Experiments determined representative temperatures, pressures, flow rates, and product composition. Comparison of solar and electric energy experiments determined the effect of solar energy varying over the period of one day and effects due to passing clouds. Experimental results indicate solar assisted distillation of ethanol fuel is technically feasible.

20089 (DOE/JPL—1060-52, pp 119-121) **PKI solar thermal plant evaluation at Capitol Concrete Products, Topeka, Kansas.** Hauger, J.S. (Applied Concepts Corp., Reston, VA); Borton, D.N. 15 Jul 1982. NTIS, PC A15/MF A01.

From Parabolic dish solar thermal power annual program review; Atlanta, GA, USA (8 Dec 1981).

Applied Concepts Corporation is supporting JPL in the structure and implementation of a system feasibility test to determine the technical and operational feasibility of using the PKI collector to provide industrial process heat. The test is of a PKI system in an industrial test bed plant at Capitol Concrete Products in Tokeka, Kansas, with an experiment control at Sandia National Laboratories, Albuquerque (SNLA). Plant evaluation will occur during a year-long period of industrial utilization. It will include performance testing, operability testing, and system failure analysis. Performance data will be recorded by a data acquisition system. Reporting will be completed monthly, with results presented as per standard SERI format. User, community, and environmental inputs will be recorded in logs, journals, and files. Applied Concepts' and PKI's engineering staff will be responsible to diagnose and correct any plant failures. Plant installation, start-up, and evaluation, are anticipated for late November, 1981. The data acquisition system and reporting methods have been tested during verification testing at SNLA.

20090 (DOE/JPL—1060-52, pp 207-223) **Point focusing collector for an integrated water/power complex.** Zewen, H. (Messerschmitt-Boelkow-Blohm, Munich, Germany); Schmidt, G.; Moustafa, S. 15 Jul 1982. NTIS, PC A15/MF A01.

From Parabolic dish solar thermal power annual program review; Atlanta, GA, USA (8 Dec 1981).

The utilization potential of the point focusing parabolic dish is identified in the areas of process heat generation, electricity generation, ad cogeneration. Main design parameters are summarized. Collector performance tests are described, as well as an application as primary energy source in a food/water/power complex. (LEW)

20091 (DOE/NBM—3008145) Analytical and experimental analysis of procedures for testing solar domestic hot-water systems. NBS Building Science Series 140. Fanney, A.H.; Thomas, W.C.; Scarbrough, C.A.; Terlizzi, C.P. (National Bureau of Standards, Washington, DC (USA)). Feb 1982. 161p. NTIS, PC A08/MF A01 - GPO. Order Number DE83008145.

A repeatable test method independent of outdoor environmental conditions and laboratory geographical location is required in order to provide a means by which solar domestic hot water systems may be rated and compared. Three experimental techniques which allow the net thermal output of an irradiated solar collector array to be reproduced indoors without the use of a solar simulator are investigated. These techniques include use of an electric heat source only, use of a nonirradiated collector array in series with an electric heat source, and the use of electric strip heaters which are attached to the back of nonirradiated absorber plates. Expressions are developed to compute the input power required for each experimental technique. Solar collectors connected in parallel and series combinations are considered. All three test techniques were shown to reproduce the outdoor daily collector array thermal output within four percent. Two of the techniques allow the actions of the circulator controller for an outdoor irradiated system to be duplicated indoors. One technique applies to solar hot water systems which operate on the thermosyphon principle. Experiments conducted to determine the effect of storage tank temperature stratification on system performance for a single-tank direct solar hot water system are described. Several return tube designs were fabricated and tested to determine the influence of thermal stratification on system performance. An analytical model for a single-tank direct hot water system is developed. The model is used to support parametric studies for the thermal performance characteristics which result from the use of each test method to duplicate the net theral output of an irradiated array. The model is also used to assess thermal performance differences which occur due to indoor versus outdoor environmental conditions.

20092 (EUR—7695-EN) Dutch solar pilot test facility. Galen, E. van; Ouden, C. den. (Commission of the European Communities, Luxembourg). 1982. 85p. Available from Commission of the European Communities, Luxembourg.

The main aim for the first phase of the research work was the construction of a pilot test facility (PTF), consisting of two solar subsystems each including amongst others an array of flat plate collectors, a storage tank and an interface simulating the behaviour of a heat distribution system in a house. Furthermore a series of checks have been performed on the operational quality of the test facility and during a few weeks the operation of the facility according to an agreed programme has been proven.

20093 (EUR—7704/III-EN) Presentation of the software for central control system 1 of the solar pilot test facilities. Vol. 3. (Commission of the European Communities, Luxembourg). 1982. 69p. Available from Commission of the European Communities, Luxembourg.

The complete programme necessary for the PTF is divided into two parts: initializations intervene at each start-up of the installation, and, for normal operation, the real-time programme is the governing procedure.

20094 (EUR—7706-FR) Pilot Test Facility (P.T.F.). Colomes, J.; Ployart, R.; Roland, S.; Salichon, M. (Commission of the European Communities, Luxembourg). 1982. 87p. (In French). Available from Commission of the European Communities, Luxembourg.

The experiment named PTF (Pilot Test Facility) and funded by the EEC (European Economic Community), is taking place simultaneously in 8 countries of the community. The dwelling is simulated by a microprocessor and a hydraulic interface, which extract energy from the experimental installations. A first reference installation (PTF 1) is of an identical design in all the participating countries. A second installation (PTF 2) allows each country to test, compare and extrapolate original designs. The COSTIC not= not= coordinates the unfolding of the PTF experiment. The C.E.A., which is the subcontractor for FRANCE, installed PTF (1 and 2) at its experimental solar test site at CADARACHE, where other complete systems are tested and compared to models (thermodynamics, desalination, storage, refrigeration...). PTF 1 has been operating since April 1979. Before undertaking a continuous testing programm, the accent has been placed on characterizing each component. Certain hydraulic modifications have had to be carried out. Characterization of the collector array is in agreement with the constructor (DRU) curve. PTF 2 has been operating since July 1979. The principal theme is the thermal management of an interseasonal storage associated with a short term storage. Outside organizations have been sought for: - selective collector arrays - organic fluids - storage using emulsion of a phase changing material - auxilliary storage heating with an aerogenerator. The test to characterize the components are in progress. The CEA computer model ORIENT has been normalized to some of the operating modes of PTF 2. The computer model SIMUL which simulated residential buildings is operational for PTF 1 and in the process of adaptation for PTF 2.

20095 (EUR—7707-EN) United Kingdom solar pilot test facility. Potter, I.N.; Lawrance-Owen, P.N.; Booth, W.B. (Commission of the European Communities, Luxembourg). 1982. 104p. Available from Commission of the European Communities, Luxembourg.

This report describes the development, design, construction and initial trials of a laboratory facility for the validation of mathematical models and systems studies of solar heating systems for houses.

20096 (EUR—7711-EN) Study and evaluation of the latent cooling potential of chemical de-humidifiers. Campbell, J.; Lush, D.M.; Moss, J.G.G. (Commission of the European Communities, Luxembourg). 1982. 85p. Commission of the European Communities, Luxembourg.

Studies to establish the practical application of solar energy to the field of latent cooling by dehumidificationare discussed, with ancillary applications when the solar collection capacity exceeds the cooling requirements. The studies are to be directed towards the production of criteria, systems and evaluation techniques to determine the viability of using solar energy in this field. For convenience, the elements of the studies are categorised into three phases which may be conducted simultaneously in part or in whole in order to facilitate the co-ordination of the elements.

20097 (LA-UR—83-3) Evaluating the performance of passive-solar-heated buildings. Balcomb, J.D. (Los Alamos National Lab., NM (USA)). 1983. Contract W-7405-ENG-36. 8p. (CONF-830405—9). NTIS, PC A02/MF A01. Order Number DE83006047.

From 6. annual ASME technical conference on commercial building heating and cooling applications; Orlando, FL, USA (19 Apr 1983).

Methods of evaluating the thermal performance of passive-solar buildings are reviewed. Instrumentation and data logging requirements are outlined. Various methodologies that have been used to develop an energy balance for the building and various performance measures are discussed. Methods for quantifying comfort are described. Subsystem and other special-purpose monitoring are briefly reviewed. Summary results are given for 38 buildings that have been monitored.

20098 (LA-UR—83-359) Guidelines for conservation levels and for sizing passive-solar collection area. Balcomb, J.D. (Los Alamos National Lab., NM (USA)). 1983. Contract W-7405-ENG-36. 26p. (CONF-830217—1). NTIS, PC A03/MF A01. Order Number DE83007550.

From Milford event meeting; Milford, PA, USA (19 Feb 1983).

Guidelines are given for selecting R-values and infiltration levels, and determining the size of the solar collection area for passive solar building. The guidelines are based on balancing the incremental cost/benefit of conservation and solar strategies. Tables are given for 209 cities in the US and the results are also displayed on maps. The procedures are developed in an appendix, which gives the cost assumptions used and explains how to develop different guidelines for different costs.

20099 (N—82-25164) Place of solar thermal rockets in space. Selph, C.C. (Air Force Rocket Propulsion Lab., Edwards AFB, CA (USA)). May 1981. 24p. NTIS PC $60.50/ MF $60.50.

In APL The 1981 JANNAF Propulsion Meeting, Vol. 2 p 265-288 (SEE N82-25149 15-99) REFS.

The harnessing of sunlight for propulsive energy is a recurring theme in space propulsion, particularly for applications requiring large velocity increments, such as planetary exploration or comet rendezvous. Characteristically, it is viewed in terms of the solar sail and the solar cell, but for operations in Earth orbit these approaches are less desirable because the very low thrust leads to undesirably long maneuver times. Thrust levels several orders of magnitude higher are available with solar thermal rockets, while preserving a specific impulse advantage over chemical systems. The performance advantages, penalties, technological problems, and approaches were examined for solar thermal rockets. Its suitability in several Earth orbit missions is assessed. The peculiarities of vehicle design, the nature of the thruster and the solar concentrator are presented, and AF plans to implement the development of solar rockets are outlined.

20100 (NP—3901149) Simulation-program validation using domestic hot-water-system data. Joergensen, O. (Danmarks Tekniske Hoejskole, Lyngby. Lab. for Varmeisolering). Aug 1982. 114p. Dep. NTIS (US Sales Only), MF A01. Order Number DE83901149.

System performance data for four domestic hot water systems were distributed to program participants from Belgium, Denmark, Germany, Italy, Japan, the Netherlands, Spain, Sweden, Switzerland, United Kingdom, United States, and the Commission of the European Communities. The data consisted of 10-minute values for August 1978. Later, one additional week of data (from August 1981) was also distributed for one of the systems for a second round of validation. A parameter sensitivity analysis for one of the systems, to extend the validation spot-check of models, was also repeated. In both cases the results improved drastically in the second round. The parameter sensitivity analysis established that not all the models were applicable for investigation of the impact of collector flow rate and control strategy variations. (LEW)

20101 (PB—82-243833) Advanced solar/gas desiccant cooling system. Final report. Huskey, B.; Sharp, J.; Venero, A.; Yen, H. (Exxon Corp., Florham Park, NJ (USA). Energy Venture Development Group). Feb 1982. 89p. NTIS, PC A05/MF A01.

The results are documented of a research and development effort to produce a desiccant cooling system with significantly higher thermal efficiency than current state-of-the-art desiccant systems. The report findings and data are based on extensive computer modeling and actual operating test results of an experimental breadboard unit employing a totally new approach. For the separation of moisture from an airstream using solid desiccants (silica gel). The results confirmed the theoretical concept of efficiency improvement over present desiccant concepts and validated the computer model used for sizing and simulating the desiccant process. The results also identified specific components and areas of the system needing improvements such as air seals, wheel drive mechanisms, air distribution and materials.

20102 (SERI/TP—234-1785) Thermochemical energy transport in a 1-MW industrial-process-heat solar system. Nix, R.G. (Solar Energy Research Inst., Golden, CO (USA)). Jan 1983. Contract AC02-77CH00178. 5p. (CONF-830405—7). NTIS, PC A02. Order Number DE83005128.

From 6. annual ASME technical conference on commercial building heating and cooling applications; Orlando, FL, USA (19 Apr 1983).

A small, industrial-process-heat application employing parabolic-dish solar collectors was studied for feasibility using various energy-transport processes. The system delivers 3.6 GJ/h (1 MW, 3.14 MBtu/h) to a single user as 4.14 MPa (600 psig), 400°C (750°F) superheated steam. The dish field and the user were separated by a distance of 0.4 km (0.25 mi). Energy transport was either by thermochemical reaction or by direct sensible energy using either steam or molten draw salt. Thermochemical energy systems investigated included CO_2 reforming of CH_4, dissocation of SO_3, and dissociation of NH_3. Both storage and nonstorage situations were considered; storage was accomplished by a two-tank molten draw salt system, regardless of the energy transport method.

20103 (SERI/TP—252-1869) Long-duration thermal storage for solar-thermal high-pressure steam IPH. Copeland, R.J.; Stern, C.; Leach, J.W. (Solar Energy Research Inst., Golden, CO (USA); California Univ., Berkeley (USA); North Carolina State Univ., Raleigh (USA)). Dec 1982. Contract AC02-77CH00178. 7p. (CONF-830405—6). NTIS (US Sales Only). Order Number DE83005127.

From 6. annual ASME technical conference on commercial building heating and cooling applications; Orlando, FL, USA (19 Apr 1983).

Solar-thermal central-receiver systems are cost effective for electric-power and industrial process-heat applications. Systems employing molten nitrate salt as both receiver working fluid and storage have previously been evaluated for diurnal thermal storage. This study evaluates the potential of employing a molten salt receiver for a baseload industrial process plant requiring saturated steam at 68 atm (1000 psi). Two types of thermal storage are evaluated: molten salt, and air and rock. When thermal storage of six hours or less is used, molten nitrate salt alone is the optimum storage. For more than six hours, the optimum storage is a combination of molten salt and air and rock. The air and rock system uses a molten-salt-to-air heat exchanger and a thermocline rock bed heated and cooled by the air. The economic potential of the system is determined. The results depend on the relative cost of fossil fuel and the solar thermal energy costs. The optimum quantity of storage is highly variable, and the range is from no storage to a long duration capacity - 48 hours.

20104 (SERI/TP—253-1830) Detailed design procedure for solar industrial-process-heat systems: overview. Kutscher, C.F. (Solar Energy Research Inst., Golden, CO (USA)). Dec 1982. Contract AC02-77CH00178. 9p. (CONF-830405—13). NTIS, PC A02. Order Number DE83005298.

From 6. annual ASME technical conference on commercial building heating and cooling applications; Orlando, FL, USA (19 Apr 1983).

A large number of handbooks have been written on the subject of designing solar heating and cooling systems for buildings. One of these is summarized here. Design Approaches for Solar Industrial Process Heat Systems, published in September 1982, addresses the complete spectrum of problems associated with the design of a solar IPH system. A highly general method, derived from computer simulations, is presented for determining actual energy delivered to the process load. Also covered are siting and selection of subsystem components, cost estimation, safety and environmental considerations, and installation concerns. An overview of the design methodology developed is given and some specific examples of technical issues addressed are provided.

20105 (SERI/TP—253-1831) Development of SOLIPH - a detailed computer model of solar industrial-process-heat systems. Kutscher, C.F. (Solar Energy Research Inst., Golden, CO (USA)). Dec 1982. Contract AC02-77CH00178. 10p. (CONF-830405—14). NTIS, PC A02. Order Number DE83005301.

From 6. annual ASME technical conference on commercial building heating and cooling applications; Orlando, FL, USA (19 Apr 1983).

In an effort to generate design tools for solar`thermal applications to industrial process heat, the need to develop a detailed computer model which could simulate hot water and steam systems (unfired boiler and flash tank) was recognized. Developing the program resulted in a model suited to specific needs and led to a better understanding of the algorithms used and assumptions made. SOLIPH (for SOLar Industrial Process Heat) is a quasi-steady-state, hour-by-hour model. For each hour of the year, climatological data are read from a TMY (Typical Meteorological Year) weather tape. Outputs are supplied on an hourly, daily, and monthly basis with a cumulative summary for the year. Before making thousands of SOLIPH runs to generate design tools, SOLIPH was verified against other computer models. In mid-1980 the SSEA working group of ASME proposed an IPH system sample problem to allow comparison of various codes. Results from TRNSYS and DOE-2 (CBS) agreed well. The same system was modeled SOLIPH and the results showed excellent agreement.

20106 **(SERI/TP—253-1871) Simple energy-calculation method for solar industrial-process-heat steam systems.** Gee, R. (Solar Energy Research Inst., Golden, CO (USA)). Jan 1983. Contract AC02-77CH00178. 11p. (CONF-830405—16). NTIS (US Sales Only). Order Number DE83007214.

From 6. annual ASME technical conference on commercial building heating and cooling applications; Orlando, FL, USA (19 Apr 1983).

Designing a solar industrial-process heat (IPH) system, sizing its components and predicting its annual energy delivery requires a method for calculating solar system performance. A calculation method that is accurate, easy to use, accounts for the impact of all important system parameters, and does not require use of a computer is described. Only simple graphs and a hand calculator are required to predict annual collector field performance and annual system losses. The energy-calculation method is applicable to a variety of solar-system configurations. The calculation method applied only to parabolic-trough steam-generation systems that do not employ thermal storage is described. Both flash tank and unfired-boiler steam systems are covered.

20107 **(SERI/TP—254-1732) Evaluation of solar domestic-hot-water control systems.** Farrington, R. (Solar Energy Research Inst., Golden, CO (USA)). Dec 1982. Contract AC02-77CH00178. 6p. (CONF-830405—3). NTIS, PC A02. Order Number DE83005110.

From 6. annual ASME technical conference on commercial building heating and cooling applications; Orlando, FL, USA (19 Apr 1983).

Literature on solar domestic hot water (SDHW) control systems was reviewed to assess results of control system performance and reliability. Seven SDHW control systems underwent six tests. Both the literature review and the testing indicate serious concerns with SDHW control system performance and reliability.

20108 **(TVA/OP/ECR—82/39(9-11)) Nashville solar-water-heater demonstration project. Monitoring-data analysis. Interim report, September 1981-November 1981.** (Tennessee Valley Authority, Chattanooga (USA). Div. of Energy Conservation and Rates). Mar 1982. 60p. NTIS, PC A04/MF A01. Order Number DE83900173.

Presented are the three months of field monitoring data that were collected for the Nashville Solar Water Heater Demonstration Project from September through November of 1981. Twenty-six solar domestic water heaters were monitored during September, 35 during October, and 37 during November. Homeowners were audited to assure adequate solar access, and each selected a solar water heating system from an approved list. Once installed, the system would be inspected for compliance with TVA guidelines. Two-tank and one-tank systems are included. The monitoring sample technique and monitoring system are described. The collected data were analyzed by computer to produce daily and monthly total summaries for each site. The performance of each site was assessed comparing: total energy saved by the solar system, solar system savings percentage, and the energy multiplier. (LEW)

20109 **(TVA/OP/ECR—82/39(12-2/82)) Nashville Solar-Water-Heater Demonstration Project. Monitoring data analysis interim report, December 1981-February 1982.** (Tennessee Valley Authority, Knoxville (USA). Div. of Energy Conservation and Rates). May 1982. 61p. NTIS, PC A04/MF A01. Order Number DE83900174.

Thermal performance data from the Nashville Solar-Water-Heating Demonstration project for the period December 1, 1981 through February 28, 1982 are presented. Because solar-water-heater performance is strongly related to weather conditions, results from this report cannot be extrapolated to apply for an annual evaluation. In addition, the number of sites presently being monitored does not constitute a representative sample size. Therefore, this report does not draw conclusions or propose solutions. Both directly measured and derived performance indicators for each calendar month for the average system are tabulated.

20110 **(TVA/PUB—83/17) Evaluation of solar-assisted heat pumps and solar house. Final report, June 1, 1977-September 30, 1981.** (Tennessee Univ., Knoxville (USA)). 1981. 100p. NTIS, PC A05/MF A01. Order Number DE83900714.

Both series and parallel solar augmented heat pump systems were installed and evaluated at the Tennessee Energy Conservation in Housing (TECH) Center in Knoxville, Tennessee. In addition, computer simulation programs were developed and verified from the experimental performance data. Parametric studies were then carried out investigating the effect of potential design changes on system performance. Economic studies were also done. The experimental performance was compared to other instrumented houses at the TECH center and elsewhere in the United States having solar systems, stand alone heat pumps, and annual storage heat pumps.

20111 **(CAPE—2805) Solar preheating of both domestic hot water and space. Final technical report for the Sea Loft restaurant in Long Branch, New Jersey (Engineering Materials).** (Sea Loft Restaurant, Long Branch, NJ (USA)). 28 Nov 1982. Contract FC01-77CS30007. TIC. Order Number DE83006509.

Stephen Giddio's Sea Loft Restaurant in Long Branch, NJ is equipped with an active solar system for preheating of both Space and Domestic Hot Water (DHW). Three pumped water loops, each closed circuit, transfer heat from one major equipment component to another. The closed loop drain back solar energy collection circuit uses a 3/4 horsepower pump to circulate seventeen gallons per minute of deionized water from the Solar Storage Tank to the Solar Collector Array, and return. This tank has a capacity of 600 gallons. The solar array consist of eighty-three evacuated tube type concentrating collectors. The heat gathered in this circuit is stored in the tank for either simultaneous or future use in either or both of the Space and DHW preheating loops. The preheating of city water prior to its entrance into the gas fired 86 gallon DHW heater is accomplished in a separate 600 gallon capacity tank. Two thirty-five square foot tubed heat exchanger bundles inserted into this tank accept solar heated hot water from the Solar Storage Tank. This solar heated water is pumped at sixteen GPM in a closed loop circuit using a 1/4 HP pump. The preheating of restaurant space is accomplished in a closed loop circuit between the Solar Storage Tank and an eight SF hot water coil inserted into the return air from the Main Dining Room of the restaurant. A 1/4 HP pump circulates fifteen gallons of solar heated hot water per minute. This system incorporates a differential temperature controller that utilizes a multitude of pressure sensors and temperature thermistors located throughout the various portions of the system components and piping. The Display Board mounted on the wall of the Bar-Lounge Area serves to integrate the entire solar system. It not only displays the flow but houses the Btu flowmeters, Digital temperature readouts, and HVAC EMS Programmer. Reference DOE/CS/30007-T1.

20112 **First phase of the solar pilot test facility project.** Nielsen, C. Luxembourg; Commission of the European Communities (1982). 38p. (EUR—7702-EN). .

A proposal of constructing a solar pilot test facility was made in 1977. The project has two purposes: 1. To be able to construct full scale solar energy systems and carry out measurements which can be used for validation of computer programmes. 2. To get a tool which can be used for developing and testing new types of solar energy systems.

20113 **Detailed design of construction of the Solar Pilot Test Facilities. Vol. 2.** Luxembourg; Commission of the European Communities (1982). 240p. (EUR—7704/II-EN). .

The detailed design of construction of a Solar Pilot Test Facility in eight European countries are presented.

20114 **Conception, construction and validation of the solar pilot test facilities. Vol. 1.** Luxembourg; Commission of the European Communities (1982). 150p. (EUR—7704/I-EN). .

In 1977, the Commission of the European Communities decided that a part of their future programme on solar energy research would be to support a project having as its initial objective the validation of computer programs to model the performance of solar heating systems in houses. At that time, very little reliable validation data was available, most of which derived from tests carried out on a limited number of installations in trial houses or from laboratory tests on individual system components. The staff of the European Commission decided that the best solution to the problem was to carry out validation tests using a laboratory installation which has since become known as a Pilot Test Facility (PTF). This consists of a real solar system complete with its collectors, storage, controls and piping, with the solar collectors subject to actual weather conditions and the system load provided by a simulator capable of producing a typical house load interactive with the weather conditions.

20115 **(CAPE—2773) Feasibility study for a solar greenhouse at the Columbus Zoo (Engineering Materials).** (Columbus Zoological Gardens, Powell, OH (USA)). 1982. Contract FG02-81R510323. TIC. Order Number DE83004991.

20116 **Passive solar architecture in Europe.** Lebens, R.M. (ed.). London, England; Architectural Press Ltd. (1981). 173p. (EUR—7291-EN-EP). European Community Information Service, 2100 M Street, NW, Suite 707, Washington, DC 20037.

The book starts with a basic technical introduction to the possible categories of passive solar heating and cooling and expands this with case studies of existing European passive solar buildings. The eleven prize-winning schemes are then presented in full, together with photographs of the models which the winners were invited to build for the exhibition. Following the section on the prizewinners come sections for each of the following: Commendations, Special Mentions and Other Details of Interest. Each of these sections is prefaced by a key map and the entries are then numbered to comply with this key. Finally there is a catalog of all the entrants whose work was included in the Brussels exhibition. The section which follows the entries contains the reports of the judging committee, the technical assessors' committee and the organisers. The appendices include a full set of the documents sent to each competitor.

20117 **(CAPE—2769) Integrated solar heating, cooling and hot water system for the San Diego City Schools, University City High School (Engineering Materials).** (San Diego Unified School District, CA (USA)). [nd]. Contract FC03-77CS31499. TIC. Order Number DE83005780.

The solar system consists of a heating circuit, two 200-ton absorption chiller hot water circuits and a hot water tube bundle circuit combined with solar collection and storage loops into a single integrated thermal system. Gas fired boilers provide backup and load peaking. Solar collection is provided by three types of panels located on a south facing hill from top to bottom are as follows: parabolic tracking concentrating reflectors, 7680 ft^2; parabolic fixed concentrating reflectors, 7364 ft^2; and fresnel lens concentrating, tracking, 2488 ft^2. The storage capacity is 88,800 gallons in 3 steel tanks. Reference DOE/CS/31499-T2.

20118 **(CAPE—2765) Solar heating system for office/warehouse buildings: piping and ductwork drawings (Engineering Materials).** (Big Green Investments, Denver, CO (USA)). [nd]. Contract FC03-78CS32125. TIC. Order Number DE83005735.

The building includes 2840 ft^2 of offices on two floors and 2360 ft^2 of full-height warehouse. The solar heating system consists of solar air heaters and rock bed heat storage. The drawings include HVAC and plumbing, fire dampers, mechanical room layout, and elevations. Reference DOE/CS/32125-T1. (MHR)

1410 Solar Collectors And Concentrators

REFER ALSO TO CITATION(S) 19973, 20056, 20069, 20092

20119 **(BMFT-FB-T—81-156) High efficient collector for small solar-powered facilities. final report.** Obermayr, E.; Molt, W.; Schneller, D.; Speidel, K. (Dornier-System G.m.b.H., Friedrichshafen (Germany, F.R.)). Sep 1981. 100p. (In several languages). NTIS, PC A05/MF A01.

A series of preliminary investigations and laboratory tests were performed as a basis for developing a new type of solar collector. The vacuum flat plate collectors are actually evaporators, where the working medium is evaporated within the collector itself. Prototypes of direct evaporation collectors were constructed and tested. In the temperature range seen for this application (130 - 150 C), the collector efficiency is about 40 - 50 percent.

20120 (DOE/JPL—1060-52, pp 3-13) **Development status of the PDC-1 parabolic dish concentrator.** Sobczak, I.F. (Ford Aerospace & Communications Corp. (FACC), Newport Beach, CA); Pons, R.L.; Thostesen, T. 15 Jul 1982. NTIS, PC A15/MF A01.

From Parabolic dish solar thermal power annual program review; Atlanta, GA, USA (8 Dec 1981).

The status of development of the 12 m. diameter parabolic dish concentrator (PDC-1) which is planned for use with the Small Community Solar Thermal Power System is summarized. The PDC-1 unit features the use of plastic reflector film bonded to structural plastic gores supported by front-bracing steel ribs. An elevation-over-azimuth mount arrangement is employed, with a conventional wheel-and-track arrangement; outboard trunnions permit the dish to be stored in the face down position, with the added advantage of easy access to the power conversion assembly.

20121 (DOE/JPL—1060-52, pp 15-20) **Acurex parabolic dish concentrator (PDC-2).** Overly, P.; Bedard, R. (Acurex Corp., Mountain View, CA). 15 Jul 1982. NTIS, PC A15/MF A01.

From Parabolic dish solar thermal power annual program review; Atlanta, GA, USA (8 Dec 1981).

The work reported is to design, fabricate, install, and test a cost-effective point-focus solar concentrator. The key to concentrator cost effectiveness is proper design of the reflector surface panels. The Low-Cost Concentrator reflective surface design is based on the use of a thin, backsilvered mirror glass reflector bonded to a molded structural plastic substrate. This combination of reflective panel material offers excellent optical performance at low cost. The design approach, rationale for the selected configuration, and the development status are briefly discussed. Reflective panel development and demonstration results are also presented.

20122 (DOE/JPL—1060-52, pp 21-24). **PKI collector.** Rice, M.P. (Power Kinetics, Inc., Troy, NY). 15 Jul 1982. NTIS, PC A15/MF A01.

From Parabolic dish solar thermal power annual program review; Atlanta, GA, USA (8 Dec 1981).

System characteristics, design improvements, and manufacturing advances of the PKI solar collector system are reviewed. There are three primary subsystems: concentrator, receiver/fluid loop, and controls. The concentrator is of a faceted Fresnel reflector design composed of 864 one foot square flat silvered glass mirrors. The mirrors are arranged in columns which are ganged together and rotated through their centers of gravity to provide elevation tracking. Azimuthal tracking is accomplished by rotation of the entire structure from east to west. A parallel tube steel heat exchanger is mounted at the concentrator focal area in a well insulated, galvanized steel housing. Automatic two axis tracking and operational control is provided with a microprocessor based package. Concentrator-mounted shadowbands are the basis of active tracking. A software program provides azimuthal tracking during cloudy periods so that collection can begin immediately upon reappearance of the sun. The collector is capable of operating unattended thanks to safety features, microprocesor control, and reliability of the system. (LEW)

20123 (DOE/JPL—1060-52, pp 25-34) **Thin film concentrator panel development.** Zimmerman, D.K. (Boeing Engineering and Construction Co., Seattle, WA). 15 Jul 1982. NTIS, PC A15/MF A01.

From Parabolic dish solar thermal power annual program review; Atlanta, GA, USA (8 Dec 1981).

It is shown that a thin film reflective surface is acceptable for use on solar concentrators, including 816°C (1500°F) applications. In addition, it is shown that a formed steel sheet substrate is a good choice for concentrator panels. The concept selected and described here uses a thin reflective film adhesively bonded to the structurally stiffened formed steel sheet substrate to form a concentrator gore. A description of the design, fabrication and evaluation of two test panels is presented.

20124 (DOE/JPL—1060-52, pp 115-118) **Verification testing of the PKI collector at Sandia National Laboratories, Albuquerque, New Mexico.** Hauger, J.S.; Pond, S.L. (Applied Concepts Corp., Reston, VA). 15 Jul 1982. NTIS, PC A15/MF A01.

From Parabolic dish solar thermal power annual program review; Atlanta, GA, USA (8 Dec 1981).

Verification testing of the PKI collector was undertaken prior to its operation as part of an industrial process heat plant at Capitol Concrete Products in Topeka, Kansas. Testing was performed at a control plant installed at Sandia National Laboratory, Albuquerque, New Mexico (SNLA). Testing was conducted in two phases to test short-term system performance characteristics and to validate system design, manufacture, and installation through operability testing. Early results show that plant performance is even better than anticipated and far in excess of test criteria. Overall plant efficiencies of 65 to 80 percent were typical during hours of good insolation. A number of flaws and imperfections have been detected during operability testing, the most important being a problem in elevation drive alignment due to a manufacturing error. All problems were corrected as they occurred and the plant, with over 40 hours of operation, is currently continuing operability testing in a wholly-automatic mode.

20125 (DOE/JPL—1060-52, pp 233-246) **High-temperature ceramic heat exchanger element for a solar thermal receiver.** Strumpf, H.J.; Kotchick, D.M.; Coombs, M.G. (AiResearch Manufacturing Co., Torrance, CA). 15 Jul 1982. NTIS, PC A15/MF A01.

From Parabolic dish solar thermal power annual program review; Atlanta, GA, USA (8 Dec 1981).

A study has been performed on the development of a high-temperature ceramic heat exchanger element to be integrated into a solar receiver producing heated air. A number of conceptual designs were developed for heat exchanger elements of differing configuration. These were evaluated with respect to thermal performance, pressure drop, structural integrity, and fabricability. The fabrication analysis was performed. The final design selection identified a finned ceramic shell as the most favorable concept. The shell is surrounded by a larger metallic shell. The flanges of the two shells are sealed to provide a leak-tight pressure vessel. The ceramic shell is to be fabricated by an innovative combination of slip casting the receiver walls and precision casting the heat transfer finned plates. The fins are bonded to the shell during firing. The unit is sized to produce 2150°F air at 2.7 atm pressure, with a pressure drop of about 2 percent of the inlet pressure. This size is compatible with a solar collector providing a receiver input of 85 kW(th). Fabrication of a one-half scale demonstrator ceramic receiver has been completed.

20126 (DOE/JPL—1060-52, pp 247-255) **Ceramic high temperature receiver design and tests.** Davis, S.B. (Sanders Associates, Inc., Nashua, NH). 15 Jul 1982. NTIS, PC A15/MF A01.

From Parabolic dish solar thermal power annual program review; Atlanta, GA, USA (8 Dec 1981).

A study is reported that examined tradeoffs for 80 kW air Brayton receivers for use on a parabolic dish concentrator and was extended to provide for the design, fabrication, and test of a receiver. Design features of the ceramic high temperature receiver and its performance are discussed. (LEW)

20127 (DOE/R5/10141—T1) **Recycling for solar applications. Final report.** (Crosby Gardens, Toledo, OH (USA)). Nov 1982. Contract FG02-79R510141. 19p. NTIS, PC A02/MF A01. Order Number DE83006597.

The original objective of the reported work was to make solar collectors from appliances recovered from solid waste. Obtaining an appliance for the purpose of recycling into a collector was found to be difficult. A workshop was held to construct two solar collectors. Benefits of the program are listed, and workshop evaluations and P.R. materials are attached. (LEW)

20128 (LA-UR—83-325) **Daily results of the initial operation of the Los Alamos salt-gradient solar pond.** Hedstrom, J.C.; Jones, G.F.; Meyer, K.A. (Los Alamos National Lab., NM (USA)). 1983. Contract W-7405-ENG-36. 15p. (CONF-830129—1). NTIS, PC A02/MF A01. Order Number DE83007543.

From Solar pond workshop group meeting; Chattanooga, TN, USA (25 Jan 1982).

The results of analysis of the initial data obtained on the Los Alamos National Laboratory salt-gradient solar pond, a 232 m^2 pond constructed for the primary purpose of studying pond hydrodynamics, are presented. The pond and the data-acquisition system were complete and in full operation by August 14, 1982. By September 21, 1982, the lower convecting zone had reached a temperature of 56°C. An energy balance was performed over this period and is presented. Soil conductivity determinations have been made from the data, and the method is discussed. As a result of a leak discovered in the pond in September, a method of determining the leak rate was developed, and the results are included.

20129 (N—82-25296) **Optical characterization of solar concentrator mirrors using the solar beam of the JPL 25-foot space simulator.** Argoud, M.J.; Dennison, E.W. (Jet Propulsion Lab., Pasadena, CA (USA)). 1982. 19p. NTIS, PC A15/MF A01.

In NASA. Goddard Space Flight Center 12th Space Simulation Conf. 19 p (SEE N82-25291 16-18).

The Jet Propulsion Laboratory 25-foot space simulator with its 5.8-m (19-ft) diameter simulated solar beam provides an excellent facility for measuring the optical characteristics of parabolic solar concentrator panels and gores. The virtual source position and size were determined by using a single lamp of the 37 xenon 30-kW source array with only the center lens in the 19-channel optical mixer. This data was used to define the optical test geometry, and it allowed accurate measurement of focal length and surface deviations of the mirror under test. A flux distribution of a typical solar concentrator placed directly on the solar beam gives measurements of performance at the focal point of the parabolic surface.

20130 (NP—3901007) **Interaction of electromagnetic radiation and micro-structured matter with respect to the generation of spectral selective solar absorbers.** Scherber, W. (Stuttgart Univ. (Germany, F.R.). Fakultaet Elektrotechnik). 19 Oct 1981. 144p. (In German). NTIS (US Sales Only), PC A07/MF A01. Order Number DE83901007.

This work is the investigation of selective layers of the type of structure filters. In the theoretical part the principles for the computation of the spectral absorption properties of structural filters are worked out.The method of approach is to test empirically different solution approaches and models for their suitability and to combine them in a modified or extended shape to form a completeness. Two complementary ways of views are represented as a result. The computed absorption spectra are compared with measurements of prepared structural filters in the experimental part. A review is given on the technology of structural filters and own developments are represented. The newly discovered electrochemical and thermal production methods are interesting startingpoints for technical applications. Finally, the theory is used to emphasize the optical quantities of solar absorbers and their parametric dependences. This way important informations on the influence of material choice, particle dimensioning, morphology is visible directly.

20131 (PB—81-235053) Dimensions, Volume 65, Number 3. (National Bureau of Standards, Washington, DC (USA)). Apr 1981. 29p. NTIS, PC A03/MF A01.

This monthly magazine features short summaries of major technical developments, highlights of work in progress, major speeches and statements by Bureau management, and a listing of NBS publications. Topics discussed are issue swinging to the Earth's tilt, testing for technical competence, physics at the measurement limits, new parameter proposed for fracture toughness, evaluation of solar collector cover plates, and improved modeling of cement and concrete, fire development in basement rooms, and generation and measurement of DC electric field with space charges.

20132 (SAND—82-1970C) Antireflection pyrex envelopes for parabolic solar collectors. McCollister, H.L.; Pettit, R.B. (Sandia National Labs., Albuquerque, NM (USA)). 1983. Contract AC04-76DP00789. 25p. (CONF-830405—18). NTIS, PC A02/MF A01. Order Number DE83008183.

From 6. annual ASME technical conference on commercial building heating and cooling applications; Orlando, FL, USA (19 Apr 1983).

Parabolic trough solar collectors utilize glass envelopes around the receiver tube in order to reduce thermal losses. Antireflective (AR) coatings applied to the envelope can potentially increase the solar transmittance by 0.07. An excellent AR surface can be formed on Pyrex (Corning Code 7740 glass) by first heat treating the glass to cause a compositional phase separation. After heat treating, a surface layer is removed using a pre-etch solution of aqueous ammonium bifluoride. Finally the AR layer is formed by etching in a solution containing hydrofluorosilic and ammonium bifluoride acid. Processing parameters studied included the phase separation temperature and heat treatment time, the pre-etch time, and the etching bath temperature and time. AR-coated samples with solar transmittance values >0.97, as compared to a value of 0.91 in untreated samples, were obtained for a range of heat treatment temperatures from 560 to 630°C. The phase separation time and temperature interact so that at 630°C short times are required (3 hours) while at 560°C longer times are necessary (24 hours). Optimum values for the other processing parameters are 12 to 18 minutes in the pre-etching bath, and 5 to 10 minutes in the film forming bath when maintained between 35 and 45°C. Application of this process to full scale 3 m long x 6 cm diameter Pyrex envelopes was successful in producing solar transmittance values ≧ 0.97.

20133 (SAND—82-7109) Development and fabrication of solar-collector SMC reflector assemblies. Kirsch, P.A. (Budd Co., Fort Washington, PA (USA). Technical Center). Dec 1982. Contract AC04-76DP00789. 46p. NTIS, PC A03/MF A01. Order Number DE83008308.

This project produced a parabolic trough solar collector array consisting of four each 2 x 6 m reflector modules. Each module required a structural torque tube on which were mounted six 1 x 2 m molded sheet molding compound (SMC)/glass panels. The project reported here established the fabrication, assembly, and inspection procedures for production of SMC reflector panels and assemblies.

20134 (SAND—83-1060C) Sol-gel derived AR coatings. Brinker, C.J.; Pettit, R.B. (Sandia National Labs., Albuquerque, NM (USA)). 1983. Contract AC04-76DP00789. 13p. (CONF-830316—1). NTIS, PC A02/MF A01. Order Number DE83007031.

From Distrubuted solar collector conference; Albuquerque, NM, USA (15 Mar 1983).

Porous sol-gel derived films prepard from aged polymeric solutions were deposited on PYREX and etched to produce AR coatings with solar averaged transmittance values greater than 0.97. This process appeared to produce single layer interference films rathr than graded index films.

20135 (SERI/TP—253-1839) Development of a consensus standard for determining thermal performance of high-concentration-ratio solar collectors. Blackmon, J.B.; Linskens, M.C.; Reed, K.A. (Solar Energy Research Inst., Golden, CO (USA); McDonnell Douglas Corp., Huntington Beach, CA (USA); National Bureau of Standards, Washington, DC (USA)). Dec 1982. 7p. (CONF-830405—8). NTIS, PC A02. Order Number DE83005129.

From 6. annual ASME technical conference on commercial building heating and cooling applications; Orlando, FL, USA (19 Apr 1983).

A description is presented of a consensus standard test method, developed by the ASTM Solar Energy Committee, for determining the thermal performance of concentrating solar collectors. The method applies to outdoor testing of one or two axis concentrating collectors which heat fluids for use in thermal systems and whose design is such that the effects of diffuse sky irradiance is negligible (i.e., performance can be characterized in terms of direct irradiance as measured with pyrheliometers). The procedures determine the optical response of the collector for various angles of incidence of solar radiation, and the thermal performance of the collector at various operating temperatures for the condition of maximum optical response. The method requires quasi-steady state conditions, measurement of environmental parameters, and determination of the fluidmass flow rate-specific heat product and temperature difference of the heat transfer fluid between the inlet and outlet of the collector. These quantities determine the rate of heat gain for the solar irradiance condition encountered. Thermal performance is then determined as the rate of heat gain of the collector relative to the solar power incident on the plane of the collector aperture.

20136 (SERI/TP—253-1870) Direct steam generation in line-focus solar collectors. May, E.K.; Murphy, L.M. (Solar Energy Research Inst., Golden, CO (USA)). Jan 1983. Contract AC02-77CH00178. 10p. (CONF-830405—12). NTIS, PC A02. Order Number DE83006030.

From 6. annual ASME technical conference on commercial building heating and cooling applications; Orlando, FL, USA (19 Apr 1983).

The performance benefits of the direct (in situ) generation of steam in the receiver tube of a line-focus solar collector are assessed. Compared to existing technology using steam-flash or unfired boiler systems, the in situ technique could produce 25% more steam at a reduced delivery cost. The analysis indicates that two-phase flow instabilities, if present, can be readily controlled, and that the possibility of freezing is not an impediment to using water in cold climates.

20137 (SERI/TP—253-1893) Testing of a prototype Fresnel-lens concentrator for thermal applications. Lewandowski, A. (Solar Energy Research Inst., Golden, CO (USA)). Feb 1983. Contract AC02-77CH00178. 8p. (CONF-830405—17). NTIS, PC A02/MF A01. Order Number DE83007312.

From 6. annual ASME technical conference on commercial building heating and cooling applications; Orlando, FL, USA (19 Apr 1983).

A prototype Fresnel-lens concentrator, manufactured by E-Systems, Dallas, Texas, was tested for thermal performance at SERI's Mid-Temperature Collector Research Facility (MTCRF). This work was funded by the DOE in an effort to support development of a testing standard for concentrators. The data obtained from this testing were presented and utilized by a subcommittee of the American Society for Testing and Materials (ASTM) in the development process for the standard. Several tests were conducted on the concentrator using draft versions of the standard as guidance. Additional tests allowed but not required by the standard were conducted to determine the effect of the direct solar irradiance level on collector performance. It is the results of these additional tests that are of primary interest. The data show that non-linear heat losses cause collector efficiency to be a function of both Δt/I/sub DN/ and I/sub DN/ and that the efficiency when fluid temperature is near ambient is also a function of I/sub DN/. This latter result is a characteristic unique to this collector, whereas the former holds for any collector with non-linear with heat loss.

20138 (SERI/TR—253-1833) **Conceptual design of the Truscott Brine Lake solar pond system. Volume II. Utility-integrated scenario.** May, E.K.; Leboeuf, C.M.; Waddington, D. (Solar Energy Research Inst., Golden, CO (USA)). Dec 1982. Contract AC02-77CH00178. 87p. NTIS, PC A05/MF A01. Order Number DE83008133.

Conceptual designs were developed for salt-gradient solar pond systems to provide pumping power for chloride control in the Red River Basin. Energy is extracted from six, 10.5-ha (26-acre) solar ponds for conversion to electricity using three organic Rankine cycle turbines. The solar pond system is located in a brine impoundment lake at Truscott, Texas. Low-salinity brine flowing into this lake is concentrated by natural evaporation to form the solar pond, and is also used for solar pond maintenance. Two operating scenarios were investigated. A continuous base load system could deliver 9.8 GWh/yr at an output of 1120 kW to the utility electric grid for an estimated capital expenditure of $12.8 million. A system operating only from June through September would cost $21.2 million for an annual energy delivery of 7.7 GWh at a net output during the operating period of 2640 kW.

1420 Heat Storage

REFER ALSO TO CITATION(S) 20103, 20737

20139 (BMFT-FB-T—81-050) **Development of a modular heat exchanger with integrated latent heat energy store. Final report, Dec. 1979.** Abhat, A.; Heine, D.; Heinisch, M.; Malatidis, N.A.; Neuer, G. (Institut fuer Kerntechnik und Energiewandlung e.V., Stuttgart (Germany, F.R.)). Feb 1981. 247p. (In several languages). NTIS, PC A11/MF A01.

Latent heat storage materials and appropriate heat exchangers for solar heating applications, such as house heating and domestic hot water production were investigated. The melting and freezing characteristics and the effects of thermal cycling on a total of 12 substances, including paraffins, fatty acids and salt hydrates, were investigated and their corrosive interaction with five conventional construction materials was determined. The poor thermal conductivity of the heat storage materials requires the development of a modular finned heat pipe heat exchanger with increased heat transfer characteristics. A cost analysis is provided and comparisons with hot water storage indicate that latent heat storage has the potential of becoming economically more attractive than the former for domestic hot water production.

20140 (BMFT-FB-T—81-149) **Investigation of medium and high temperature phase change materials for thermal energy storage. Final report, Apr. 1980.** Heine, D.; Heess, F.; Steiner, D. (Institut fuer Kerntechnik und Energiewandlung e.V., Stuttgart (Germany, F.R.)). Aug 1981. 110p. (In several languages). NTIS, PC A06/MF A01.

Investigations in the temperature ranges 200 to 450 C and 700 to 900 C, are reported. These investigations comprise the corrosion of structural materials together with promising storage materials and the thermal stability and the melting and freezing behavior of the storage materials. The mass losses of sheet metal samples were measured from the corrosion tests, and thickness reduction and corrosion rate were calculated. The corrosion type was determined using microscopes. Furthermore, melting and freezing curves were continually measured during cycling tests. The thermal stability of the storage materials was thereby determined as a function of the melting and freezing properties. The combinations mild steel with $NaNO_3$, boiler steel with $KCl-ZnCl_2$, $NaNO_3$ and $MgCl_2$-$NaCl$, and $NICu_{30}Fe$ with $KCl-ZnCl_2$ were found to be compatible in the temperature range 200 to 450 C.

20141 (DOE/JPL—1060-52, pp 35-47) **Transmittance-optimized, point-focus fresnel lens solar concentrator.** O'Neill, M.J.; Goldberg, V.R.; Muzzy, D.B. (E-Systems, Inc., Dallas, TX). 15 Jul 1982. NTIS, PC A15/MF A01.

From Parabolic dish solar thermal power annual program review; Atlanta, GA, USA (8 Dec 1981).

A point-focus Fresnel lens solar concentrator for high-temperature solar thermal energy system applications is discussed. The concentrator utilizes a transmittance optimized, short focal length, dome shaped refractive Fresnel lens as the optical element. An 11-meter diameter concentrator has been designed and is expected to provide an overall collector efficiency of about 70% at an 815°C receiver operating temperature and a 1500X geometric concentration ratio. The Fresnel concentrator development program is presented, including a description of the concentrator, a summary of its expected performance, results of optical and thermal analyses of the collector, a discussion of manufacturing methods for making the large lens, and an update on the current status and future plans of the development program. (LEW)

20142 (EUR—7699-EN) **Development of a thermal storage system based on the heat of absorption in hygroscopic materials.** Verdonschot, J.K.M.; den Ouden, C. (Commission of the European Communities, Luxembourg). 1982. 58p. Available from Commission of the European Communities, Luxembourg.

The main aims of the research work were the development of a heat storage system using a solid adsorbent as storage medium and to study the behaviour of such a heat storage system as a component of a total air-based solar heating system. In order to develop such a storage system several solid adsorbing materials have been examined and based on experimental tests of the water adsorbing capacity, heat of adsorption, velocity of adsorption and desorption reactions as well as other criteria, the solid adsorbing agent called 'Sorbead-R' has been selected for a first prototype heat storage system. The results of the measurement of various properties of these hygroscopic materials are used in a total system study. This study is carried out with the use of a computer simulation model describing the interaction between the components of a solar heating installation in terms of actual hourly heat flows during one year. A storage system optimization is realised with a reference solar heating installation and a veritable adsorbent heat storage volume. The result of this study was a guideline for the design of a prototype heat storage system. This reaction vessel, filled with 400 kg of Sorbead-R, has a heat capacity of 350 MJ (approx. equal to 100 kWh, air humidity 5 gr/kg) which is comparable to a rock bed storage system of 5 m^3 (temperature range 20-80°C). This reaction vessel has been tested in a specially constructed testcircuit with respect to heat storage capacity, fill time, heat removal capability, thermal gradient and moisture content gradient.

15 GEOTHERMAL ENERGY

20143 (PB—82-221433) **The evaluation of the Communities' geothermal energy, production and utilization of hydrogen, and systems analysis: development of models R and D sub-programmes. Research evaluation report no. 2.** Barten, A.P.; Brown, D.A.; Chadwick, A.T.; Farinelli, U.; Roersch, A. (Commission of the European Communities, Luxembourg). [nd]. 94p. NTIS, PC AE05/MF E05.

The results of the Community's first RandD program in the fields of geothermal energy, production and utilization of hydrogen, and systems analysis were evaluated. A pragmatic approach was followed; evaluation criteria included the energy value (or potential value) of the results, their scientific and technological value, their possible contribution to the Community's social and economic development and their fostering of international cooperation.

1501 Resource Status And Assessment

20144 (DOE/ET/27014—T4) **1979-1980 Geothermal Resource Assessment Program in Washington.** Korosec, M.A.; Schuster, J.E. (Washington Div. of Geology and Earth Resources, Olympia (USA)). 1980. Contract AC07-79ET27014. 294p. NTIS, PC A13/MF A01. Order Number DE83000906.

Separate abstracts were prepared for seven papers. Also included are a bibliography of geothermal resource information for the State of Washington, well temperature information and locations in the State of Washington, and a map of the geology of the White Pass-Tumac Mountain Area, Washington. (MHR)

20145 (DOE/ET/28365—T2) **Colorado's hydrothermal resource base: an assessment.** Pearl, R.H. (Colorado Geological Survey, Denver (USA)). 1979. Contract AS07-77ET28365. 154p. NTIS, PC A08/MF A01. Order Number DE83006663.

As part of its effort to more accurately describe the nations geothrmal resource potential, the US Department of Energy/Division of Geothermal Energy contracted with the Colorado Geological survey to appraise the hydrothermal (hot water) geothermal resources of Colorado. Part of this effort required that the amount of energy that could possibly be contained in the various hydrothermal systems in Colorado be estimated. The findings of that assessment are presented. To make these estimates the geothermometer reservoir temperatures estimated by Barrett and Pearl (1978) were used. In addition, the possible reservoir size and extent were estimated and used. This assessment shows that the total energy content of the thermal systems in Colorado could range from 4.872 x 10^{15} BTU's to 13.2386 x 10^{15} BTU's.

20146 (LBL—13600, pp 105-107) **Evaluation of the hydrothermal potential of the Ashdod Area, Israel.** Benson, S.M. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1980.

The Earth Sciences Division has recently become involved in a project to evaluate the hydrothermal potential in and around Ashdod, Israel. The US Agency for International Development (AID) is evaluating the hydrothermal potential of this area because a seawater desalination plant being constructed in Ashdod will have large requirements for a low-grade heat source. The objective of this evaluation is to determine if the hydrothermal resource at Ashdod is of suitable temperature, brine chemistry, size, and productivity to economically replace the existing heat source for the plant. It is estimated that approximately 2100 m^3/hr of 95°C brine will be required to replace the existing heat source.

1502 Geology And Hydrology Of Geothermal Systems

REFER ALSO TO CITATION(S) 20144

20147 (DOE/ER/10763—2) **Depth to and concentrations of water in large bodies of silicic magma. Progress report, July 1, 1982-June 30, 1983.** Anderson, A.T. (Chicago Univ., IL (USA)). 3 Mar 1983. Contract AC02-80ER10763. 5p. NTIS, PC A02/MF A01. Order Number DE83008082.

Large bodies of silicic magma are potential sources of geothermal energy and ore. They also pose threats of catastrophic eruptions. The depths of such bodies are related to their economic potential and probably to their eruption mechanisms. The concentrations of water in the magmas are important for their eruptive and dynamical behavior and for the development of ores. Estimates of viscosity and density of melt require knowledge of concentration of water. The concentration of water in melt before ascent and eruption can be measured in inclusions of glass which became trapped in crystals before extrusion. The depth of a magma body can be estimated or delimited if we can find out the concentrations of both carbon dioxide and water in the inclusions of glass. Initial results on the Bishop Tuff of Long Valley Caldera, California yield 4.9 +- 0.5 percent H_2O for glass included in quartz from the Plinian air fall pumice. This result is comparable to the estimates of Hildreth (1977) of about 3.5 to 4.9 percent H_2O in the lowermost part of the Bishop ash flow. From January 1982 through December 1982, analyses of inclusions of glass in two additional quartz phenocrysts from the Plinian air fall unit of the Bishop Tuff revealed variable H_2O and CO_2. The corresponding partial pressures range between about 2000 and 5000 atmospheres, assuming gas saturation. The variation may be natural or caused by an analytical artifact. A computerized data file has been constructed to facilitate the storage and retrieval of published and unpublished chemical analyses of glasses and minerals. Some data on the Bishop Tuff are presently stored.

20148 (EGG—2239) **Prickett and Lonnquist aquifer simulation program for the Apple II minicomputer.** Hull, L.C. (EG and G Idaho, Inc., Idaho Falls (USA)). Feb 1983. Contract AC07-76ID01570. 25p. NTIS, PC A02/MF A01. Order Number DE83008120.

The Prickett and Lonnquist two-dimensional groundwater model has been programmed for the Apple II minicomputer. Both leaky and nonleaky confined aquifers can be simulated. The model was adapted from the FORTRAN version of Prickett and Lonnquist. In the configuration presented here, the program requires 64 K bits of memory. Because of the large number of arrays used in the program, and memory limitations of the Apple II, the maximum grid size that can be used is 20 rows by 20 columns. Input to the program is interactive, with prompting by the computer. Output consists of predicted lead values at the row-column intersections (nodes).

20149 (LA—9625-HDR) **Candidate sites for future hot-dry-rock development in the United States.** Goff, F.; Decker, E.R. (Los Alamos National Lab., NM (USA)). Dec 1982. Contract W-7405-ENG-36. 40p. NTIS, PC A03/MF A01. Order Number DE83007103.

Generalized geologic and other data are tabulated for 24 potential hot dry rock (HDR) sites in the contiguous United States. The data show that HDR resources occur in many geologic and tectonic settings. Potential reservoir rocks at each prospect are described and each system is cateogrized accoridng to inferred heat sources. The Fenton Hill area in New Mexico is discussed in detail because this region may be considered ideal for HDR development. Three other prospectively valuable localities are described: The Geysers-Clear lake region in California, the Roosevelt Hot Springs area in Utah, and the White Mountains region in New Hampshire. These areas are singled out to illustrate the roles of significantly different geology and geophysics, reservoir rocks, and reservoir heat contents in possible HDR developments.

20150 (LBL—13600, pp 113-115) **Modeling of fracture reservoirs.** Pruess, K.; Narasimhan, T.N.; Bodvarsson, G.S. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1980.

Most geothermal reservoirs are highly fractured systems. The fractures provide conduits through which fluid (and heat) can flow at rates which are sufficiently large to be of commercial interest. Traditional approaches to geothermal reservoir evaluation and analysis have employed a porous medium approximation, which amounts to assuming instantaneous (thermal and hydrologic) equilibrium between fractures and matrix. A new numerical modeling technique, termed the Multiple Interacting Continua Method (MINC), has been developed which treats transient fluid and heat flow within the matrix and fractures.

20151 (LBL—13600, pp 133-138) **Overview of the Mexican-American cooperative program at the Cerro Prieto Geothermal Field.** Lippmann, M.J.; Zelwer, R. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1980.

The Lawrence Berkeley Laboratory (LBL) is coordinating the US technical activities being carried out at Cerro Prieto under a five-year agreement between the US Department of Energy (DOE) and the Comision Federal de Electricidad de Mexico (CFE). This agreement, signed in July 1977, is expected to expire in July 1982. Efforts are being made to continue some of the research beyond the formal termination of the agreement. This paper described the program.

20152 (LBL—13600, pp 138-141) **Geologic model of the Cerro Prieto Geothermal Field.** Halfman, S.E.; Howard, J.H.; Vonder Haar, S.P. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1980.

One of the tasks under the Mexican-American cooperative agreement is the comprehensive geologic study of the Cerro Prieto geothermal field. Using logs from over seventy deep wells as the basic source of information on the subsurface geology, a working model of the Cerro Prieto geothermal field is being developed.

20153 (USGS/MAP/I—1297) **Geologic map of the Crater Springs Known Geothermal Resources Area and vicinity, Juab and Millard Counties, Utah.** Galyardt, G.L.; Rush, F.E. (Geological Survey, Reston, VA (USA)). 1981. 21p. USGS, Box 25286 - Federal Center, Denver, CO 80225.

1503 Geothermal Exploration And Exploration Technology

REFER ALSO TO CITATION(S) 20144, 22031

20154 (DOE/ET/27010—1) **McCoy Area, Nevada geothermal reservoir assessment case history - Northern Basin and Range. Final report, 1 October 1978-30 September 1982.** Pilkington, H.D. (AMAX Exploration, Inc., Golden, CO (USA)). Oct 1982. Contract AC08-79ET27010. 76p. NTIS, PC A05/MF A01. Order Number DE83008083.

The McCoy geothermal prospect is located in north-central Nevada at the junction of the Augusta Mountains, Clan Alpine Mountains and the New Pass Range. Geothermal exploration on the prospect consisted of an integrated program of geologic, geochemical and geophysical studies. The geochemical studies included hydrogeochemistry, soil geochemistry, and drill cuttings geochemistry. Geophysical exploration included heatflow studies, aeromagnetic, self-potential, gravity, passive seismic, dipole-dipole resistivity, electromagnetic and magnetotelluric surveys. Exploration drilling includes fifty-two (52) shallow thermal gradient holes and five (5) intermediate depth temperature gradient wells. Shallow low-temperature geothermal reservoirs were encountered in two areas. In the McCoy Mine area the resource was found in the Permo-Pennsylvanian rocks. In the southern part of the prospect a resource with temperatures of 100°C was encountered in the basal conglomeratic sandstone of the Triassic section.

20155 (LBL—13600, pp 86-88) **Inferred conductivity distribution in the vicinity of Mount Hood, Oregon, based on the interpretation of magnetotelluric and telluric data.** Mozley, E.C.; Goldstein, N.E. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1980.

Magnetotelluric and telluric measurements were acquired in the vicinity of Mount Hood, Oregon, as part of a program to evaluate the geothermal potential of this stratovolcano located in the High Cascade Range of northern Oregon. The survey area is characterized by rugged topography ranging from deeply eroded valleys surrounding the valcano, with elevations as low as 2000 ft, to the volcanic peak itself, with an elevation of 11,235 ft. The field procedure for data acquisition was to occupy four stations simultaneously and thus obtain a five-component magnetotelluric measurement supplemented by two remote telluric vector measurements and one remote two-component magnetic measurement. The data were processed using the auto-power and cross-spectral estimates obtained via the fast Fourier transform algorithm.

20156 (LBL—13600, pp 88-90) **In-field processing and magnetotellurics with the EM-60 electromagnetic system.** Wilt, M.; Goldstein, N.E.; Haught, J.R.; Labson, V.; Morrison, H.F. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1980.

In 1977, Lawrence Berkeley Laboratory and the Engineering Geosciences group at the University of California, Berkeley, designed and constructed the EM-60 electromagnetic system for use in intermediate-depth geothermal exploration. This system has been used with excellent success for geothermal exploration and crustal studies and has proved to be effective even in areas of complex geology or rugged local terrain. Although the original system required an excessive amount of post-field-processing for data interpretation and was incapable of proper on-site data evaluation for quality control, significant improvements have been made during the past year. The EM-60 system now allows for in-field data processing and on-site calculation of apparent resistivity. The modifed system also allows for the possibility of simultaneous measurements of controlled-source (dipole) electromagnetic and magnetotelluric (MT) soundings.

20157 (LBL—13600, pp 90-91) **Deep electromagnetic sounding in the Basin and Range Province.** Wilt, M.; Goldstein, N.E.; Haught, J.R.; Morrison, H.F. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1980.

During the spring of 1981, a deep electromagnetic (EM) sounding survey was undertaken in the northern Basin and Range Province by Lawrence Berkeley Laboratory (LBL). The purposes of the project were (1) to confirm the presence of deep conductive bodies first detected with magnetotelluric measurements, (2) to investigate the geometry of these bodies, and (3) to test the LBL controlled-source EM system (EM-60) as modified to perform deep sounding work. These deeply buried conductors may have important tectonic implications; if they consist of partially molten rock, they could be the heat source of the numerous hot springs and geothermal systems in northern Nevada.

20158 (LBL—13600, pp 92-95) **Simple one-dimensional inversions of magnetotelluric data.** Goubau, W.M. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1980.

The exact solution to the one-dimensional inverse problem in magnetotellurics was first derived by Weidelt. Often it is much more desirable to find an approximate inverse that can be computed rapidly. The most commonly used simple inverse is one proposed by Bostick. Bostick's algorithm is concise enough that it can be evaluated with a pocket calculator, and in many cases it yields an inverse that reflects all of the essential features of the true inverse. This report presents alternative inversion schemes that are derived from Maxwell's equations and that can, in principle, be made more accurate.

20159 (LBL—13600, pp 99-102) **Advances in transient well-testing methodology.** Miller, C.W.; Benson, S.M.; Bodvarsson, G.S. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1980.

A major problem in determining the transmissivity and storativity of a geothermal reservoir is that in most cases the flow in the reservoir is two-phase. Conventional well-test methods are primarily applicable to isothermal, single-phase reservoirs. One of the tasks in fiscal 1981 was to understand the effects of two-phase wellbore flow on pressure transient tests and to determine appropriate testing and analysis procedures. Analysis methods for injection tests data in a fractured two-phase reservoir were also studied.

20160 (LBL—13600, pp 102-104) **Low- to moderate-temperature hydrothermal reservoir engineering research.** Benson, S.M.; Solbau, R.; Bodvarsson, G.S. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1980.

In 1981 a new program was established at Lawrence Berkeley Laboratory to develop reservoir engineering methodology and reservoir assessment techniques specific to low- and moderate-temperature hydrothermal systems. The new program focused on developing a computational model for thin fault-charged hydrothermal reservoirs, development of well-testing instrumentation, compiling and publishing case studies of low- to moderate-temperature reservoirs, and writing a handbook with reservoir engineering guidelines for potential developers.

20161 (LBL—13600, pp 118-121) **Subsidence modeling of the Pleasant Bayou geothermal geopressured region.** Goyal, K.P.; Narasimhan, T.N.; Vonder Haar, S.P. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1980.

The Pleasant Bayou prospect, a geothermal geopressured area, is located in Brazoria County, Texas. Deltaic sandstones of the Frio Formation, at a depth of about 14,000 ft (4.27 km), are found to have potential for a geothermal geopressured reservoir. Two exploratory wells have been drilled by the US Department of Energy (DOE), with a separation of 500 ft. The Pleasant Bayou area is part of a deep sedimentary basin traversed by growth faults. For purposes of subsidence modeling, a circular area with a radius of 5 miles and centered at the DOE wells is considered.

20162 (LBL—13600, pp 122-124) **Fluid sampling and analysis of geopressured brine.** Hansen, L.; Galbraith, R.M.; Weres, O.; Michel, M.; Sverjensky, D. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1980.

Economic assessment of the low-temperature geopressured brines found in certain Gulf Coast formations requires knowledge of their methane content and a clear understanding of their geochemistry. In support of the Gas Research Institute (GRI) and the Department of Energy (DOE), the Lawrence Berkeley Laboratory (LBL) has fabricated and tested a downhole fluid sampler designed to operate under the pressures, temperatures, and chemical conditions that prevail in geopressured zones. Additionally, through the use of brine modeling codes, LBL has studied the chemical problems associated with production and disposal of geopressured fluids.

20163 (LBL—13600, pp 141-144) **Geophysical monitoring at the Cerro Prieto Geothermal Field.** Wilt, M.; Zelwer, R.; Majer, E.L. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1980.

In 1978 we began a program of reservoir monitoring at the Cerro Prieto geothermal field using surface geophysical methods with the objective of observing changes resulting from production. The three methods used in this study are dipole-dipole resistivity, precision gravity, and passive seismic monitoring.

1504 Legal And Institutional Aspects

20164 (DOE/SF/01795—1) **Geothermal guidebook.** (National Conference of State Legislatures, Denver, CO (USA)). Jun 1981. Contract FG03-78SF01795. 55p. NTIS, PC A04/MF A01. Order Number DE83007211.

The guidebook contains an overview, a description of the geothermal resource, statutes and regulations, and legislative policy concerns. (MHR)

20165 (DOE/SF/01795—3) **National Conference of State Legislators Geothermal Project. Final report, February 1978-September 1982.** (National Conference of State Legislatures, Denver, CO (USA)). 1982. Contract FG03-78SF01795. 31p. NTIS, PC A03/MF A01. Order Number DE83007413.

The activities of the National Conference of State Legislatures Geothermal Project in stimulating and assessing state legislative action to encourage the efficient development of geothermal resources, including the use of ground water heat pumps, are reviewed by state. (MHR)

1506 Environmental Aspects And Waste Disposal

20166 (LBL—13600, pp 110-113) **Injection of cold water into geothermal reservoirs.** Bodvarsson, G.S.; Tsang, C.F.; Pruess, K.; O'Sullivan, M.J. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1980.

Reinjection of geothermal wastewater is gradually becoming a preferred means of waste disposal. At present, continuous reinjection is practiced at The Geysers, California; Ahuachapan, El Salvador; Mak Ban, Philippines; and five Japanese geothermal fields. The increasing interest in reinjection undoubtedly results from growing environmental concerns regarding toxic minerals (e.g., boron, arsenic) present in geothermal wastewater. Our objective has been to investigate the advancement of the thermal front during injection into a fractured reservoir system. The system under consideration consists of equally spaced horizontal fractures intersecting an injection well. Analytical and numerical studies are designed to address the important question of how fractures affect the movement of the thermal front during injection.

1507 By-products

20167 (PB—82-260985) **Operation of a mineral recovery unit on brine from the Salton Sea Known Geothermal Resource Area. Report of investigations/1982.** Schultze, L.E.; Bauer, D.J. (Bureau of Mines, Reno, NV (USA). Reno Research Center). Jul 1982. 18p. NTIS, PC A02/MF A01.

The Bureau of Mines operated a mineral recovery unit to recover metal values from post-flash geothermal brines from the Salton Sea known geothermal resource area as part of its research into the use of plentiful resources. The brine was available for metals recovery after its heat content had been used to generate electricity. The brine source was treated with lime to precipitate the contained iron, manganese, lead, and zinc before injection of the heat-depleted brine into the underground reservoir. Data are presented on the effects of process variables, such as rate and method of lime addition and air oxidation versus air exclusion. Variations in precipitation of metal values, composition of precipitates, effectiveness of slurry thickeners, and methods of treating the precipitates to recover metal values are discussed.

1508 Geothermal Power Plants

REFER ALSO TO CITATION(S) 20012, 20192

20168 (LBL—13600, pp 108-110) **Baca demonstration project.** Bodvarsson, G.S.; Wilt, M.; Delany, J.; Tsang, C.F. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1980.

The Baca geothermal field is located in the Valles Caldera, New Mexico, approximately 55 miles north of Albuquerque. The field is being developed for 50 MWe power production by the Union Oil Company of California (Union) and the Public Service Company of New Mexico (PNM) in cooperation with the Department of Energy (DOE). To date, 24 wells have been drilled in the Redondo Creek area in the western part of the caldera. The role of Lawrence Berkeley Laboratory in the Baca project is to analyze the data made public by Union and to act as an advisor to DOE during the course of the project. This report summarizes this year's activities and describes the present status of the Baca project.

20169 (LBL—13600, pp 168-170) **Partitioning of hydrogen sulfide in the condensers of Geysers Unit 15.** Weres, O. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1981.

Geysers Unit 15 was the first of the geothermal units equipped with surface condensers to go on line at The Geysers power plant of the Pacific Gas and Electric Company. Units 1 through 12 have contact condensers. The switch to surface condensers was motivated by considerations of hydrogen sulfide emission abatement. In the contact condensers, there is a large liquid-to-vapor ratio, and about 75% of the hydrogen sulfide that is present in the geothermal steam supply ends up dissolved in the cooling water. Once in the cooling water, it is emitted to the atmosphere from the cooling towers unless further, tertiary abatement is employed. It was reasoned that, because the liquid-to-vapor ratio in a surface condenser would be smaller by a factor of about twenty-five than in a contact condenser, most of the hydrogen sulfide would remain in the vapor phase and leave with the gas vented from the condenser rather than by dissolving in the condensate. Unit 15 is equipped with a Stretford Unit, which removes the hydrogen sulfide from the vent gas and converts it to elemental sulfur by reaction with air. Therefore, the fraction of the hydrogen sulfide that leaves the condenser with the vent gas is not emitted to the atmosphere.

20170 (ANL/NESC—891) **ANALYZE; hydrothermal reservoir test analysis.** Benson, S.M.; McEdwards, D. (Lawrence Berkeley Lab., CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048891.

Maxima of - 20 observation wells 99 observation points per well 250 flow rate points per production well; .

ANALYZE is a history matching program designed for the analysis of both interference tests and production tests in single phase, fluid saturated reservoirs. The analytic solution calculates pressure responses in an isothermal, isotropic, homogeneous, porous medium of constant thickness and infinite areal extent. The production well is modeled as a fully penetrating line source. Flow in the reservoir is horizontal and of uniform flux over the height of the well. Linear boundaries are modeled using the method of images. By minimizing the difference between a set of measured pressure points and a set of calculated pressure points the program returns the reservoir parameters of transmissivity, storativity, and distance to a single linear reservoir boundary. In addition, for analysis of production well data, a "skin" value indicative of the wellbore condition can be obtained. The technique employed allows the simultaneous analysis of pressure data from up to twenty observation wells, each influenced by the production and/or injection of as many as 20 wells with arbitrarily varying flow rates.CDC7600; FORTRAN IV (99%) and COMPASS (1%); SCOPE 2.1.5; 27,000 (octal) words of SCM and 107,000 (octal) words of LCM storage.

20171 (ANL/NESC—892) **CCC; one-phase conduction convection compaction.** Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Bodvarsson, G.S. (Lawrence Berkeley Lab., CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048892.

Maximum of - 12 materials It is assumed that - (a) Darcy's law adequately describes fluid movement through fractured and porous media. (b) The rock and fluid are in thermal equilibrium at any given time. (c) Energy changes due to the fluid compressibility, acceleration, and viscous dissipation are neglected. (d) One-dimensional consolidation theory adequately describes the vertical deformation of the medium. .

The numerical model CCC (conduction-convection-consolidation) solves the heat and mass flow equations for a fully, liquid-saturated, anisotropic porous medium and computes one-dimensional (vertical) consolidation of the simulated systems. The model has been applied to problems in the fields of geothermal reservoir engineering, aquifer thermal energy storage, well testing, radioactive waste isolation, and in situ coal combustion. The code has been validated against analytic solutions for fluid and heat flow, and against a field experiment for underground storage of hot water.CDC7600; FORTRAN IV; SCOPE 2.1.5; 66,000 (octal) words of memory.

20172 (ANL/NESC—893) **SHAFT79; two-phase geothermal reservoir model.** Pruess, K.; Schroeder, R.C. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048893.

SHAFT79 has been developed only for systems of water and rock. The fluid table covers most of the equation of state of water substance in the temperature range of 5 to 400 degrees C and the pressure range of 0.5 to 220 bars, which is adequate for most geothermal applications.

SHAFT79 (Simultaneous Heat And Fluid Transport) is an integrated finite difference program for computing two-phase non-isothermal flow in porous media. Although designed for simulating production and injection in geothermal reservoirs, it is, or can be readily modified to be, applicable to other two-phase problems. SHAFT79 solves coupled mass and energy balance equations based on the following major assumptions: the physical system is a system of porous rock saturated with a one-component fluid in liquid and vapor form; all rock properties, except porosity, i.e., density, specific heat, thermal conductivity, and absolute permeability are independent of temperature, pressure, or vapor saturation; and liquid, vapor, and rock matrix are at the same temperature and pressure at all times. Capillary pressure is neglected.CDC7600; FORTRAN IV; SCOPE 2.1; 725,000 (octal) words of storage are required.

20173 (ANL/NESC—894) **TERZAGI; isothermal fluid flow & subsidence.** Narasimhan, T.N. (Lawrence Berkeley Lab., CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048894.

TERZAGI solves for transient and steady-state fluid potentials in one-, two- or three-dimensional saturated, deformable systems, such as artesian aquifers or petroleum reservoirs. The system can be made up of porous or fractured materials and can have complex geometry. The flow region can be heterogeneous and anisotropy can be handled by orienting surfaces of volume elements normal to principal axes of permeability. The material properties such as permeability and matrix compressibility can be functions of pressure. Boundary conditions can be functions of potential or time. The program has been applied to problems related to ground subsidence, flow in fractured rocks, and hydraulic fracturing and has been extensively validated.CDC7600,CYBER175; FORTRAN IV; SCOPE 2.1.5 (CDC7600), NOS 1.3 (CYBER175); 106,000 (octal) words of main memory are required for execution.

20174 (ANL/NESC—895) **WELBORE; transient wellbore fluid flow model.** Miller, C.W. (Lawrence Berkeley Lab., CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048895.

WELBORE is a code to solve transient, one-dimensional two-phase or single-phase non-isothermal fluid flow in a wellbore. The primary thermodynamic variables used in solving the equations are the pressure and specific energy. An equation of state subroutine provides the density, quality, and temperature. The heat loss out of the wellbore is calculated by solving a radial diffusion equation for the temperature changes outside the bore. The calculation is done at each node point in the wellbore.CDC7600,CYBER175; FORTRAN IV; SCOPE 2.1.5; 55,000 (octal) words of SCM storage.

20175 (DOE/SF/11503—T2) **Simulated heat-exchanger tubes: DOE Geothermal Test Facility, East Mesa, California. Corrosion test report.** Ellis, P.F. II; Anliker, D.M. (Radian Corp., Austin, TX (USA)). Nov 1982. Contract AC03-81SF11503. 19p. (DCN—82-212-011-42). NTIS, PC A02/MF A01. Order Number DE83007415.

A 1032-hr corrosion test was made of two geothermal heat exchanger materials, Allegheny-Ludlum Alloy 29-4 and Alloy 29-4C. Coupons of the two metals were exposed under conditions simulating flow in a geothermal heat exchanger tube. Continuous flow and cyclic exposure tests were made. No signs of localized corrosion were observed in either the base metal, tube weld seam, or heat affected zone. Most coupons showed statistically insignificant weight change. A corrosion rate of less than 0.5 mil/yr is indicated. No significant difference in the performance of the two alloys is reported. (LEW)

20176 (LBL—13600, pp 115-118) **Generic studies of geothermal reservoir behavior.** Pruess, K.; Bodvarsson, G.S.; Lippmann, M.J.; Truesdell, A.H. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1980.

The characteristics and behavior of geothermal reservoirs are often strongly influenced by geologic and hydrologic conditions that are peculiar to a given site. Site-specific detail can render a reservoir description and analysis so complex that it becomes difficult to identify the important physical mechanisms and parameters which govern reservoir behavior. Some important insight into the evolution of geothermal reservoirs under natural or man-made conditions can be gained from a study of schematic, idealized representations of such reservoirs. Generic studies are particularly useful for two-phase geothermal reservoirs with coexisting water and steam. The presence of two phases with different densities and heat contents can give rise to peculiar and sometimes surprising phenomena, which can be conveniently explored by means of computer simulation. In this paper, two such simulation studies are summarized. One addresses the problem of natural evolution of geothermal reservoirs over geologic time; the other examines energy recovery and reservoir longevity for different completion depths of production wells.

20177 (LBL—13600, pp 124-125) **Simulation of thermal energy storage in a doublet well system.** Buscheck, T.A.; Doughty, C.; Tsang, C.F. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1980.

While the first cycle of the 1981 series of experiments was being carried out by Auburn University at Mobile, Alabama, Lawrence Berkeley Laboratory (LBL) was performing a numerical simulation based on the field operating conditions to predict the outcome of the experiment before its conclusion. The goal was to test our understanding of the aquifer storage problem and to validate our numerical model CCC. In the Mobile experiment, 25,000 m^3 of water at approximately 55 to 60°C was injected over a period of one month into an aquifer that is approximately 21 m thick, has a permeability of about 63 d and was initially at 20°C. It was then stored for one month and subsequently produced.

20178 (LBL—13600, pp 126-128) **Dimensionless parameter approach to the thermal behavior of an aquifer thermal energy storage system.** Doughty, C.; Hellstrom, G.; Tsang, C.F.; Claesson, J. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1980.

The purpose of aquifer thermal energy storage (ATES) site-characterization studies is to develop a general procedure whereby the energy recovery factor for a given site may be predicted readily for a wide range of operating conditions without doing detailed numerical simulations. The study summarized here considers the thermal behavior of an ATES system with steady radial fluid flow around a single injection/production well. Buoyancy flow is neglected, and the aquifer is confined above and below by impermeable confining layers.

20179 (LBL—13600, pp 128-129) **Characterization of heat storage in confined aquifers with buoyancy flow.** Buscheck, T.A.; Tsang, C.F. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1980.

In order to develop a graphical means of estimating the energy recovery performance of a proposed storage aquifer, including buoyancy effects, numerical simulations have been conducted over a wide range of aquifer permeabilities and injection temperatures using the numerical model CCC, which takes into account temperature-dependent parameters and the buoyancy flow process.

20180 (LBL—13600, pp 129-132) **Comparative study of four major approaches to predicting ATES performance.** Doughty, C.; Buscheck, T.A.; Bodvarsson, G.S.; Tsang, C.F. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1980.

The International Energy Agency test problem involving Aquifer Thermal Energy Storage (ATES) has been solved using four approaches: the numerical model PF (formerly CCC), the simpler numerical model SFM, and two graphical characterization schemes. Each of the four techniques has its advantages and disadvantages, as discussed in the paper.

20181 (LBL—13600, pp 144-147) **Reservoir engineering studies of the Cerro Prieto Geothermal Field.** Goyal, K.P.; Lippmann, M.J.; Tsang, C.F. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1980.

Reservoir engineering studies of the Cerro Prieto geothermal field began in 1978 under a five-year cooperative agreement between the US Department of Energy and the Comision Federal de Electricidad de Mexico (CFE), with the ultimate objective of simulating the reservoir to forecast its production capacity, energy longevity, and recharge capability under various production and injection scenarios. During the fiscal year 1981, attempts were made to collect information on the evolution history of the field since exploitation began; the information is to be used later to validate the reservoir model. To this end, wellhead production data were analyzed for heat and mass flow and also for changes in reservoir pressures, temperatures, and saturations for the period from March 1973 to November 1980.

20182 (SAND—81-1795C) **USA program in geothermal drilling and completion research and development.** Carson, C.C.; Caskey, B.C. (Sandia National Labs., Albuquerque, NM (USA)). 1982. Contract AC04-76DP00789. 21p. (CONF-820506—3). NTIS, PC A02. Order Number DE82006298.

From International conference on geothermal energy; Florence, Italy (11 May 1982).

The program objective is to conduct long-range R and D aimed at developing advanced geothermal drilling and completion systems to expand resource utilization. The program is organized into four broad categories: (1) rock penetration mechanics, (2) drilling fluids, (3) borehole mechanics, and (4) diagnostics technology. Although much effort has been concentrated on bit development under rock penetration mechanics, current work focuses on understanding the limitations of drag bits as they apply to hard rock drilling systems. Fluid technology R and D addresses the high temperature, high corrosion and abnormal pressure problems found in geothermal areas. A high-temperature clay-based mud has been developed. The R and D in borehole mechanics addresses the problems of lost circulation and lining and cementing the well, as well as problems of production maintenance such as perforating and scale removal. Well logging and downhole instrumentation R and D activities are organized under the diagnostics technology program element.

20183 (SAND—82-1616) **Effects of oxygen, salt, and pH level on corrosion rate of drill-stem steel.** Weirick, L.J. (Sandia National Labs., Albuquerque, NM (USA)). Nov 1982. Contract AC04-76DP00789. 44p. NTIS, PC A03/MF A01. Order Number DE83007580.

A technique proposed to control corrosion of the drill pipe is removal of oxygen from the drilling fluid. One approach to oxygen reduction is to substitute an anaerobic gas for air in the drilling fluid. A critical question to be answered when designing the anaerobic gas generator is what level of oxygen concentration is acceptable within the inert gas such that a low corrosion rate will be maintained. A laboratory program was done to answer this question. The program was designed to determine the effect of oxygen content, salt concentration and pH level on the corrosion rate of plain carbon steel. The corrosion rate of steel was found to decrease with increasing salt concentration at fixed pH levels and with oxygen contents in solution at equilibrium with air at 90°C. The corrosion rate was found to decrease with increasing pH at fixed concentrations of salt and oxygen at 90°C. The corrosion rate was also found to be proportional to the dissolved oxygen concentration at fixed pH levels and salt concentration. It is recommended that the anaerobic gas generator be designed to lower the oxygen concentration one order of magnitude below that in solution in equilibrium with air, that is, to approximately 500 ppB at 90°C.

20184 (SAND—83-0422C) **Geothermal versus conventional drilling.** Kelsey, J.R. (Sandia National Labs., Albuquerque, NM (USA)). 1983. Contract AC04-76DP00789. 3p. (CONF-830422—1). NTIS, PC A02/MF A01. Order Number DE83007603.

From Workshop on high temperature geothermal wells: planning, drilling and completion; Reno, NV, USA (5 Apr 1983).

The procedure for drilling, completing, and logging a geothermal well is outlined. The areas which differ from conventional oil and gas methods are pointed out. (MHR)

20185 **Temperature profiles and aquifer mass transfer in a circulating well.** Oster, C.A.; Scheffler, W.A. (Battelle Pacific Northwest Laboratory, P. O. Box 999, Richland, Washington 99352). *Journal of Heat Transfer;* **104**: No. 1, 173-180(Feb 1982). Contract AC06-76RL01830.

A method is described for determining the temperature distribution in a circulating drilling fluid when aquifers are present in the formation. The depth of an aquifer relative to the well depth is shown to be an important parameter. An aquifer near the surface has much less influence on the temperature distributions than one located near the bottom of the well. If the drilling fluid has much greater density than the entering formation water, then the temperature distributions are altered significantly.

1510 Direct Energy Utilization

20186 (EUR—7801-EN) **Geothermal heating.** Aureille, M. (Commission of the European Communities, Brussels (Belgium)). 1982. 117p. European Community Information Service, 2100 M Street NW, Suite 707, Washington, DC 20037.

The decision to build a gothermal heating plant generally requires the prior knowledge of a number of factors, some of which cannot be determined at the time the decision is made. It is useful to estimate the degree to which a geothermal project can be influenced by the totality of these variables. This problem has necessitated the use of computer programs. The aim of this study is to demonstrate the influence of the main variables and then to supply nomograms from which an initial estimate may be made, without having to use data-processing faiclities, of the viability of projects in both energy and economic terms. The studies carried out by EDF and OET were divided up as follows: EDF concentrated on the effect of the variables on drilling (flow rate and temperature of the geothermal water) and on the network whereas OET concentrated on the effect of climate and the type of housing. As regards the central boiler plant, similar studies have been carried out showing two alternative schemes for the incorporation of heat pumps. The graphs and nomograms have been drawn up by EDF, using the same criteria to describe the housing accomodation and the plan for connecting the heating network to the geothermal resource.

20187 (NP—3901249) **Appendices of an appraisal for the use of geothermal energy in state-owned buildings in Colorado. Section A. Alamosa.** Meyer, R.T.; Coe, B.A.; Dick, J.D. (Colorado Geological Survey, Denver (USA)). 1981. 41p. Colorado Geology Survey, Dept. of Natural Resources, Denver, CO.

Two state-owned building complexes have been evaluated within the city of Alamosa: Adams State College and the State Highway Department Buildings. The resource assessment in dicates that 150°F may be available at flow rates of 1000 gpm per well, depths of 4000 feet, and possibly under Artesian pressure. Two building retrofit engineering options are evaluated for Adams State College, both of which assume only partial replacement (approximately 50%) of the existing natural-gas-fired steam-boiler system. The two retrofit options for goethermal heating include (1) a high performance central heat pump for boosting the circulating heat water to 200°F for space heating and (2) a central heat exchanger for delivery of heating water at 145°F. The first option provides for continued usage of the existing hot water heating units in the campus buildings, with the exception of retrofit of the steam units in College Center. The second option provides for the addition of terminal hot water heating units in all of the buildings in order to adapt to 145°F heating water. Retrofit engineering for the State Highway Department Buildings provides for the use of a central heat exchanger and the distribution of 140°F heating water to all building areas that are presently heated.

20188 (NP—3901251) **Appendices of an appraisal for the use of geothermal energy in state-owned buildings in Colorado. Section E. Glenwood Springs.** Meyer, R.T.; Coe, B.A.; Dick, J.D. (Colorado Geological Survey, Denver (USA)). 1981. 23p. Colorado Geological Survey, Department of Natural Resources, Denver.

The State Highway Department Buildings in Glenwood Springs have been evaluated in this appraisal for the use of geothermal energy in state-owned buildings. Glenwood Springs is the location of surface hot springs and has been assessed by various parties for several geothermal applications. The Glenwood Highway Department Buildings consist of an office building and a maintenance garage. These two building140 gpm. currently use an array of natural gas forced air furnaces and electric heaters for space/heating purpose; a propane unit is used for one water heater. Retrofit engineering for geothermal heating is based upon a central plate-in-frame heat exchanger coupled to several fan coil heaters and unit heaters. Design heating can be accomplished with 150°F geothermal water at 140 gpm. The geothermal energy economics are evaluated for a single deep well, with and without a proration of the total production well cost for the required 140 gpm out of the 1000 gpm production capacity. Only the prorated well cost option provides an economically feasible geothermal system. The feasibility, therefore, depends on the use of the excess geothermal water by private or municipal facilities. The principal institutional/environmental issue for a geothermal heating sytem for the Highway Department Buildings is the question of whether or not the states owns the geothermal rights on the state property.

20189 (NP—3901252) **Appendices of an appraisal for the use of geothermal energy in state-owned buildings in Colorado. Section D. Durango.** Meyer, R.T.; Coe, B.A.; Dick, J.D. (Colorado Geological Survey, Denver (USA)). 1981. 63p. Colorado Geology Survey, Dept. of Natural Resources, Denver, CO.

Four state-owned building complexes ahve been evaluated within the city of Durango: The State Fish Hatchery, Fort Lewis College, new State Highway Department Building near the Bodo Industrial Park, and the National Guard Building. Three of the state facilities in Durango are evaluated for geothermal systems on thea ssumption of taking geothermal water from a trunk-line originating at the area northof Durango: State Fish Hatchery, Fort Lewis College and new State Highway Department Building. The National Guard Building is evaluated on the basis of a water-to-air heat pump, with warm water derived from a hypothetical shallow aquifer immediately below the building site. Two geothermal options were separately evaluated for Fort Lewis College: a central heat exchanger system for delivery of 145°F heating water to the campus buildings and a central heat pump system for boosting the heating water to 200°F prior to delivery to the buildings; both systems require the installation of a distribution piping network for the entire campus area. Retrofit engineering for the State Fish Hatchery provides for the installation of a small scale central distribution piping system to the several buildings, a central heat excanger coupled to the geothermal trunk line, and the use of various fan coil and unit heaters for space heating. An option is provided for discharge-mixing the geothermal water into the fish ponds and runs in order to raise the hatchery water temperature a couple degrees for increasing fish production and yield. The heating system for the new State Highway Department Building is redesigned to replace the natural-gas-fired forced-air furnaces with a heat exchanger, hot water fan coils and unit heaters.

20190 (NP—3901253) **Appendices of an appraisal for the use of geothermal energy in state-owned buildings in Colorado. Section C. Burlington.** Meyer, R.T.; Coe, B.A.; Dick, J.D. (Colorado Geological Survey, Denver (USA)). 1981. 13p. Colorado Geological Survey, Dept. of Natural Resources, Denver, CO.

The State Highway Department Building in Burlington has been evaluated in this geothermal energy appraisal. While there is no known geothermal resource at Burlington, a shallow water aquifer - Ogallala Aquifer - does exist beneath Burlington at depths of 200 to 300 feet. One particular water well is reported to be producing water at 59°F to 63°F at 800 to 1000 gpm. Therefore, the Ogallala is being considered as a source of warm water for the use of water-to-air heat pumps for space heating of the Highway Department Building. The geothermal energy economics are evaluated for two options: (1) a new water well drilled on the site of the Highway Department Building and (2) the purchase of warm water from an existing City of Burlington water well. The latter option is evaluated only for the 12 percent/9 percent (through 1984/through 2000) natural gas price escalation case, whereas the former option is evaluated for both the 15 percent and the 12 percent/9 percent schedules. The results of the economic evaluations generally indicate that heat pumps would not be economically competitive, particularly if the state purchased city water at the current water rates. Fuel price escalation rates greater than 15 percent per year can shift the heat pump shallow well option to a marginal position. The principal institutional/environmental issue to be addressed for the Burlington facility is an existing ordinance which only allows the city to drill water wells within the city.

20191 (NP—3901255) **Appraisal of the use of geothermal energy in state-owned buildings in Colorado.** Meyer, R.T.; Coe, B.A.; Dick, J.D. (Western Energy Planners Ltd., Denver, CO (USA)). 30 Jan 1981. 75p. Colorado Geological Survey, Dept. of Natural Resources, Denver.

An appraisal of the use of geothermal energy for space heating requirements for selected state-owned buildings in six communities in Colorado is presented. The appraisal addresses several components of a feasibility study for geothermal applications, including resource assessment, pipeline rights-of-way, well design and drilling program, conceptual engineering designs for retrofits of building heating systems, evaluations of economic feasibility, institutional requirements, and environmental considerations. Economic feasibility is determined from evaluation of four economic measures: a simple payback period in years; twenty-year annualized system costs (geothermal system versus conventional system); total twenty-year undiscounted energy savings; and total twenty-year present value energy savings. The results of the analyses of each feasibility component are finally ranked, using a weighting system, to arrive at an order ranking of the eleven state-owned buildings for overall feasibility. The relative total feasibility rankings and the absolute evaluations of economic competitiveness with the existing conventional-fuel heating systems show that several of the state facilities are likely candidates for conversion to geothermal hot water heating systems. The best candidate by far is the Colorado State Reformatory at Buena Vista. The geothermal resource at Buena Vista (Cottonwood Canyon and Chalk Creek) is a high quality resource with high water temperatures and a water quality adequate for direct flow through the building heating units.

20192 (NP—3901572) **Utilization of geothermal heat in tropical fruit-drying process.** Chen, B.H.; Lopez, L.P.; King, R.; Fujii, J.; Tanaka, M. (Hawaii Univ.--Hilo Coll. (USA); Hawaii Univ., Honolulu (USA); Okahara, Shigeoka and Associates, Inc., Hilo, HI (USA)). Oct 1982. 112p. NTIS, PC A06/MF A01. Order Number DE83901572.

The power plant utilizes only the steam portion of the HGP-A well production. There are approximately 50,000 pounds per hour of 360°F water produced (approximately 10 million Btu per hour) and the water is currently not used and is considered a waste. This tremendous resource could very well be used in applications such as food processing, food dehydration and other industrial processing that requires low-grade heat. One of the applications is examined, namely the drying of tropical fruits particularly the papaya. The papaya was chosen for the obvious reason that it is the biggest crop of all fruits produced on the Big Island. A conceptual design of a pilot plant facility capable of processing 1000 pounds of raw papaya per day is included. This facility is designed to provide a geothermally heated dryer to dehydrate papayas or other tropical fruits available on an experimental basis to obtain data such as drying time, optimum drying temperature, etc.

20193 (PNL-SA—8907) **Economics of solar, geothermal, and conventional space heating.** Garrett-Price, B.A. (Pacific Northwest Lab., Richland, WA (USA)). Oct 1980. Contract AC06-76RL01830. 9p. (CONF-801210—30). NTIS, PC A02/MF A01. Order Number DE83003464.

From 3. Miami international conference on alternative energy sources; Miami Beach, FL, USA (15 Dec 1980).

The costs of residential heating using conventional, solar and geothermal energy were calculated for a number of locations throughout the United States using life-cycle costing methodology. Using these costs, regions and applications are identified which show the most promise for near-term commercialization of geothermal and solar energy. Equally important, areas and applications are depicted which are not likely to be promising for solar or geothermal heating in the near-term. The regions showing the most immediate promise for solar heating occur in central Nevada, Utah and Colorado. These regions are characterized by high levels of insolation and high annual heating degree-days. Geothermal urban district heating currently appears to be an economic option for providing space heat in at least six locations: Reno, Nevada; Idaho Falls, Boise and Twin Falls, Idaho; Helena, Montana; and Klamath Falls, Oregon. These areas are characterized by high annual heating degree-days, high resource temperatures, and short transmission distances. In the near-term, conventional heating will continue to be most economic: (1) in the South (where annual heat demand is low); (2) in the Northeast and Midwest (where isolation levels are low and where known geothermal resources are not yet available); and (3) in the Pacific Northwest coastal region (where low-cost electricity is available).

1520 Geothermal Data And Theory

REFER ALSO TO CITATION(S) 20147, 22062

20194 (CONF-8209108—1) **Some natural zeolites: recent thermodynamic results, their application, and the estimation of missing thermodynamic quantities.** O'Hare, P.A.G.; Johnson, G.K.; Flotow, H.E.; Wise, W.S. (Argonne National Lab., IL (USA); California Univ., Santa Barbara (USA)). 1982. Contract W-31-109-ENG-38. 6p. NTIS, PC A02/MF A01. Order Number DE83007704.

From 2. conference on calorimetry; Prague, Czechoslovakia (13 Sep 1982).

New calorimetric measurements are reported on the following minerals: analcime, dehydrated analcime, natrolite, scolecite, mesolite, and heulandite. The thermodynamic quantities determined include the standard enthalpy of formation, ΔH/sub f/° (298°K), the high- and low-temperature enthalpy increments, H° (T) - H° (298°K), the low-temperature (5 to 350°K) heat capacity, C/sub p/° (T), the standard entropy, S° (T), and the Gibbs energy of formation, ΔG/sub f/° (T). The application of calorimetric data to equilibria of geologic interest is demonstrated. A part of the paper also deals with the estimation of missing thermodynamic quantities.

20195 (LBL—13600, pp 151-152) **Behavior of rock-fluid systems at elevated temperatures and pressures.** Somerton, W.H. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1980.

With an increase in the number of underground processes being studied in environments that are either artificially heated or that are naturally subject to high temperatures and pressures, knowledge of the physical properties and behavior of rock-fluid systems under stress and at elevated temperatures has become important in designing, controlling, and analyzing such processes. The purpose of the present research project is to provide data on the following properties of rock-fluid systems: deformation properties, including pore and bulk compressibilities and thermal expansions; P- and S-wave velocities; absolute permeability; electrical resistivity factor; and thermal properties, including conductivity, diffusivity, and specific heats. Work accomplished during the past year in two areas (modeling of pore and bulk compressibilities and thermal expansions, and measurements of electrical resistivity factors at elevated temperatures) is reviewed here.

20196 (LBL—13600, pp 152-154) **Thermodynamics of high-temperature brines.** Pitzer, K.S.; Rogers, P.S.Z.; Peiper, J.C. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1980.

Current interest in a variety of geochemical phenomena, including geothermal and geopressurized brines, has focused attention on the importance of a model for aqueous solution properties at high temperatures and pressures. The number of different brines encountered is large, hence obtaining detailed measurements on each of them is impractical. A model was needed that would be capable of predicting the properties of complex brines yet be based on a minimum amount of experimental data on a few key systems. Thus a program was begun in 1975 to study the solution thermodynamics of brine systems, including both modeling and experimental work.

20197 (LBL—13600, pp 155-157) **Preliminary determination of the $Al(OH)_4^-$ stability constants in the aqueous phase at elevated temperatures.** Neil, J.M.; Apps, J.A. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1980.

One of the benefits to be gained from measuring the solubilities of major rock-forming minerals in the aqueous phase at elevated temperatures is the opportunity of testing thermochemical models describing aqueous interactions. The refinement of such models is an important step in interpreting geochemical reactions taking place during diagenesis, metasomatism, and metamorphism. Comparison between measured solubilities and the solubilities projected from calorimetric data serves to identify either data base or model errors, which become the departure point for further research. One source of error is the uncertainty about the species of aluminum in solution at elevated temperatures.

20198 (LBL—13600, pp 157-159) **Thermodynamic properties of silicate materials.** Carmichael, I.S.E.; Moret, L.K.; Rivers, M.L.; Stebbins, J.F.; Mo, X. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1980.

Measurements of the thermodynamic properties of silicate liquids and glasses are generally few in number, and yet essential if the generation of magmas at depth in the earth, their ascent toward the surface, and their ascent toward the surface, and their cooling on or near the surface are to be quantified. General geologic investigations have provided almost unlimited data on the range of compositions of natural silicate liquids, but comparatively little on the correspondence between their composition and such properties as volume, thermal expansion, compressibility, heat content, and heat capacity. It is the intent of this experimental program to remedy this situation by combining measurements of thermodynamic properties over a wide range of silicate compositions to obtain the compositional dependence of the measured property.

20199 (LBL—13600, pp 160-163) **Nonequilibrium, interphase mass transfer in chemical transport by groundwater.** Carnahan, C.L.; Remer, J.S. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1980.

The research described here is a part of a larger study of nonequilibrium processes in mass transport by flowing groundwater. In this phase of the work, we have developed analytical solutions for convective-dispersive transport of a radioactive solute that undergoes time-dependent sorption on surfaces of the matrix supporting the flow. The rate of sorption is represented by a linear kinetic rate law, corresponding to the approximation of very low sorbate activity in the fluid phase. These solutions were derived, along with solutions for the case of equilibrium sorption, to serve as references for comparison with numerical results for transport problems using nonlinear kinetic rate laws of sorption and with more complex treatments, including effects of thermodynamic coupling of transport processes; these investigations are now in progress.

20200 **(PB—83-111443) The solubility of methane, carbon dioxide, and oxygen in brines from 0 deg to 300 deg c. Report of investigations/1982.** Cramer, S.D. (Bureau of Mines, Avondale, MD (USA). Avondale Research Center). Aug 1982. 23p. NTIS, PC A02/MF A01.

The solubility of methane, carbon dioxide, and oxygen was measured in brines at temperatures from 0 to 300C as part of Federal Bureau of Mines research on the corrosion of metals in high-temperature geothermal and mineral processing environments. Solubilities were measured by the technique of extracting pure gas, dissolved at pressures where Henry's law was applicable, from known volumes of brine. The results were smoothed with respect to temperature.

20201 **Heat and mass transfer in a fault-controlled geothermal reservoir charged at constant pressure.** Goyal, K.P.; Narasimhan, T.N. (Earth Sciences Division, Lawrence Berkeley Laboratory, University of California, Berkeley, California 94720). *Journal of Geophysical Research;* **87**: No. B10, 8581-8590(10 Oct 1982).

A two-dimensional mathematical model of a fault-controlled geothermal reservoir has been developed. Heated lighter water, rising in the fault, is assumed to charge a reservoir which, in turn, is overlain by a thin, impermeable, thermally conducting cap rock. The mass flow rate or the pressure associated with the charging process at the fault inlet is unknown and can only be estimated. Thus in this paper the pressure in the fault at the bottom of the reservoir is assumed to be presented. Quasianalytic solutions for the velocity, pressure, and temperature are obtained in the fault-reservoir system for a high Rayleigh number flow. In this approximation, the upwelling fluid does not cool off appreciably until it reaches the cold upper boundary of the reservoir and encounters conductive heat loss. This thermal boundary layer, which is thin at the top of the fault, grows outward laterally and occupies the full thickness of the aquifer far away from the faults. The mathematical model is based on the flow of liquid water in a saturated porous medium. The solution techniques involve the combination of perturbation methods, boundary layer theory, and numerical methods. The analysis of this generic model can be applied to liquid-dominated geothermal systems where the thickness of the impermeable cap rock is very small compared to the depth of the reservoir.

17 WIND ENERGY

20202 **(N—8228783) Capturing energy from the wind.** Schefter, J.L. (National Aeronautics and Space Administration, Washington, DC (USA)). 1982. 88p. (NASA-SP—455). NTIS (US Sales Only); GPO HC $6.00 as 033-000-008-50-3.

The history of windpower is reviewed. Wind turbine technology is discussed. Examples of small and large turbines are provided. Electric power generation is considered. Numerous illustrations are included.

20203 (Juel-Spez—71, pp 195-205) **Testing and evaluating of LS/WECS.** Schroers, H. Mar 1980. Fachinformationszentrum Energie, Physik, Mathematik, Karlsruhe, Germany, F.R.

From 3. meeting of experts - data acquisition and analysis for large scale wind energy conversion systems; Blowing Rock, NC, USA (26 - 27 Sep 1979).

Designing and putting up a windmill somewhere in order to gain energy by wind, the following questions will arise: 1. location, 2. wind profile, 3. extreme wind velocities, 4. gust factors and profiles, 5. power spectra of wind, 6. horizontal and vertical correlations. The first two items are very important to economic use. The next items are of considerable importance to safety against fracture. Instrumentation of wind measurements is discussed and a plant for determing gusts is presented.

20204 **(NYSERDA—81-22) Wind-energy resources in the area of the City of Buffalo.** Sforza, P.M.; Smorto, M.J. (Flowpower, Inc., Huntington Station, NY (USA)). Sep 1981. 107p. New York State Energy Research and Development Authority, Two Rockefeller Plaza, Albany, NY 12223.

An evaluation of wind energy resources found in the area of the City of Buffalo is presented. Wind speed and direction data from three sites within the City have been collected and subjected to computer processing for identification of candidate sites for wind energy conversion applications. A detailed assessment of wind turbine performance at the three sites is carried out and the resulting data are presented. An economic analysis of the value of operating nine different large-scale (65 kW to 6200 kW) wind turbine generators at these sites is then performed and the capital and operating costs are listed and discussed, for the case of individual demonstration units. A description of various financial considerations, such as simple payback period for each machine at the three sites is also presented. The institutional, environmental and land use considerations operative at the three selected sites are discussed. The outlook for improvements in the delivery and economics of wind power through technological development is described.

1703 Regulations

20205 **(RFP—3386) Small-wind-systems zoning issues and approaches.** Dodge, D.M.; Lawless-Butterfield, C. (Rockwell International Corp., Golden, CO (USA). Energy Systems Group). May 1982. Contract AC04-76DP03533. 64p. NTIS, PC A04/MF A01. Order Number DE83007195.

Issues associated with installing small wind systems in areas covered by local zoning codes and ordinances are discussed. The discussion is designed for three audiences: zoning boards, purchasers of small wind systems, and manufacturers and dealers whose products must comply with the codes and who are often called upon for assistance and information by their customers. Beginning with a brief description of small wind systems, the report goes on to explain the requirements for siting them, including the reasons high towers are needed. Commonly defined tower safety and wind-turbine safety and environmental issues are discussed and distinctions made between those which should not be of concern and those which should be addressed by zoning boards. The nature of zoning regulations, including the legal bases for local jurisdiction, are discussed for the benefit of those with little or no experience in this complex subject. To further aid small-wind-systems purchasers and manufacturers/dealers, a step-by-step procedure is provided for developing and presenting a variance or compliance application. Finally, an annotated series of approaches to small-wind-systems zoning issues gleaned from ordinances which have been proposed or enacted in various localities throughout the United States is appended.

1704 Economics

20206 **(ANL/NESC—932) WECS; wind energy value to electric utilities.** Hock, S. (Solar Energy Research Inst., Golden, CO (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048932.

WECS is a package of five computer models developed by the Solar Energy Research Institute to implement a method for determining the value of Wind Energy Conversion Systems (WECS) to electric utilities. These models, WTP, WEIBUL, ROSEW, ULMOD, and FINAM, may be used with most utility planning models. The value determination procedure begins with the processing of weather data by either the WTP or WEIBUL program to produce hourly wind speed data or wind probability distributions for each hour of a monthly typical day, respectively. The function of WTP is to convert a single year of standard weather data into a format acceptable to the ROSEW program. WEIBUL is preferable to WTP if two or more years of weather data are available because its probabilistic representation of hourly wind speeds is more likely to represent the long-term wind speeds than WTP's hourly average wind speeds. ROSEW calculates the wind energy system hourly power output using weather data supplied and wind machine characteristics. For WTP-supplied weather data, a single hourly wind power is calculated. For WEIBUL-supplied weather data, a group of wind powers with associated probabilities for each hour is calculated. ULMOD uses the electricity production estimate calculated by ROSEW to reduce a user-supplied utility hourly-load forecast. This reduced load profile is then put into a variety of forms suitable for use with electric utility planning models (e.g. LOLP, PRODUCTION COSTING, GENERATION EXPANSION PLANNING). Utility load forecasting uncertainty can be reflected. FINAM is designed to determine the value (in $/kW) and marginal value of alternative electric utility investment options, such as Wind Energy Conservation Systems, by using base case utility operating data with up to ten change cases.

20207 **(N—8229712) Wind turbine value analysis for electric utilities.** Dub, W. (Regensburg Univ. (Germany, F.R.)). Jun 1982. 20p. NTIS, PC A02/MF A01.

A methodology for the analysis of the value of large-scale wind turbines to electric utilities, and its application to utility, socioeconomic and meteorological data in two case studies is described. The value analysis was carried out for the year of reference 1985 and included different levels of wind turbine penetration. Results of the value analysis are given. The utility planning procedures in current use and the unique problems of the integration of wind power into the power system are discussed. Observations and conclusions regarding the current and future potential of wind power for utilities are presented.

20208 **(NYSERDA—81-22(A)) Wind farm economics in the area of the city of Buffalo.** Liebowitz, B. (New York State Energy Research and Development Authority, New York (USA)). Dec 1982. 18p. New York State Energy Research and Development Authority, Two Rockefeller Plaza, Albany, NY 12223.

The economics of wind energy in the area of the city of Buffalo is reviewed from the point of view of the private wind farm developer. The tax provisions of the Windfall Profits Tax and the Economic Recovery Tax Act are applied to a discounted cash flow analysis.

20209 **(RFP—3448) Wind systems life cycle cost analysis: a description and users manual.** Sherman, J.M.; Gresham, M.S.; Fergason, D.L. (Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant). Jul 1982. Contract AC04-76DP03533. 88p. NTIS, PC A05/MF A01. Order Number DE83008769.

This report describes the LIFECC computer program developed for the purpose of calculating the cost of energy produced by wind systems according to the principles of life cycle costing (LCC). Following a brief explanation of the LCC concept and its advantages, input variables to the program and their importance to various program users, including manufacturers and designers, utilities, various institutions and consumers, are explained. A detailed user's guide to the program is then provided, together with a sensitivity analysis which discusses the impact of key variables on wind system cost of energy and the importance of cash flow to the wind system purchaser. Sample cases of program output and an LIFECC program listing are provided.

1705 Environmental Aspects

20210 **(BEOP—16) Building licenses for wind turbines. Preliminary directives and case studies.** (Bureau Energie Onderzoek Projecten, Patten (Netherlands)). Dec 1982. 86p. (In Dutch). NTIS (US Sales Only), PC A05/MF A01. Order Number DE83901339.

Directives for construction permits and operating licenses. Possible effects on the environment (nuissance, bird killing, noise and vibration, poor reception of radio and TV signals) are discussed briefly. Guidelines related to safety, construction and urban planning are dealt with and conditions for the erection of wind turbines are given. Legal aspects are surveyed.

20211 **(DOE/NASA/0129—1) Design and evaluation of low-cost stainless steel - fiberglass-foam blades for large wind-driven generating systems.** Eggert, W.S. Jr. (Budd Co., Fort Washington, PA (USA). Technical Center). Oct 1982. Contract AI01-76ET20320. 56p. (NASA-CR—165491). NTIS, PC A04/MF A01. Order Number DE83007588.

The development of a low cost wind turbine blade design based on a stainless steel/fiberglass foam design concept is described, and its principle characteristics, its low cost features, and its advantages and disadvantages are evaluated. A blade structure was designed and construction methods and materials were selected. Complete blade tooling concepts, various technical and economic analysis, and evaluations of the blade design were performed. A study was made to determine the applicability of the blade design concept to various blade lengths in the range of 15 ft to 200 ft. A test specimen of the spar assembly, including the root and attachment, was fabricted. This 20 ft long full-scale section will be fatigue tested by NASA. It was concluded that the stainless steel/fiberglass-foam blade concept is a viable design for application to large wind turbine systems. A blade design was completed which meets the requirements for operation on the MOD-OA wind turbine. The design concept is applicable to various length blades. Blades less than 60 feet would use a stainless steel spar and blades of larger size would have a fusion welded carbon steel spar. The design permits a choice of a wide selectivity of air-foil shapes and, because of its modular construction, the design provides producibility and quality in high volume production.

20212 (DOE/NASA/20320—43) **Construction of low-cost, Mod-0A wood-composite wind-turbine blades.** Lark, R.F. (National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center). 1983. Contract AI01-76ET20320. 15p. (NASA-TM—83046; CONF-830408—3). NTIS, PC A02/MF A01. Order Number DE83005344.

From 28. national Society for the Advancement of Materials Process Engineers symposium; Anaheim, CA, USA (12 Apr 1983).

The construction of two sixty-foot, low-cost, wood composite blades for service on 200 kW Mod-0A wind turbines is described. The blades were constructed of epoxy resin-bonded Douglas fir veneers for the leading edge sections, and paper honeycomb-cored, birch plywood faced panels for the afterbody sections. The blades were joined to the wind turbine hub by epoxy resin-bonded steel load take-off studs embedded into the root end of the blades. The blades were installed on the 200 kW Mod-0A wind turbine facility at Kahuku, Hawaii. The blades have completed nearly 8000 hours of operation over an 18 month period at an average power of 150 kW prior to replacement with another set of wood composite blades. The blades were replaced because of a corrosion failure of the steel shank on one stud. Inspections at NASA-Lewis showed that the wood composite structure remains in excellent condition.

20213 (DOE/R5/10109—1) **Demonstration of an a-c utility-connected wind generator in an urban setting. Final report, June 1979-December 1982.** Hill, L.; Kistler, A. (Evanston, City of, IL (USA)). 31 Jan 1983. Contract FG02-79R510109. 99p. NTIS (US Sales Only). Order Number DE83006696.

The goal of the work reported was the visible demonstration of an archetypical small wind machine specifically designed for urban conditions. A concurrent education program about wind machines and their urban potential was to be given for manufacturers, marketers, and consumers. The intent of the project, changes and developments are chronicled, followed by technical appendices and copies of educational and publicity materials.

20214 (EPRI-AP—2795) **Siting guidelines for utility application of wind turbines. Final report.** Pennell, W.T. (Pacific Northwest Lab., Richland, WA (USA)). Jan 1983. Contract AC06-76RL01830. 263p. NTIS, PC A12/MF A01. Order Number DE83007428.

Utility-oriented guidelines are described for identifying viable sites for wind turbines. Topics and procedures are also discussed that are important in carrying out a wind turbine siting program. These topics include: a description of the Department of Energy wind resource atlases; procedures for predicting wind turbine performance at potential sites; methods for analyzing wind turbine economics; procedures for estimating installation and maintenance costs; methods for anlayzing the distribution of wind resources over an area; and instrumentation for documenting wind behavior at potential sites. The procedure described is applicable to small and large utilities. Although the procedure was developed as a site-selection tool, it can also be used by a utility who wishes to estimate the potential for wind turbine penetration into its future generation mix.

20215 (GKSS—82/E/48) **Comparative examination of operating conditions of wind energy converters in the 10kW output class.** Fries, S.; Bruegmann, J.; Petersen, G.; Mengelkamp, H.T. (GKSS-Forschungszentrum Geesthacht G.m.b.H., Hamburg (Germany, F.R.)). 1982. 40p. (In German). NTIS (US Sales Only), PC A03/MF A01. Order Number DE83901590.

GKSS is operating a test filed for wind energy converters at the North Sea island of Pellworm. The test field, especially its technical equipment, and the installed wind energy converters are described. The operation experiences and the test results of the first two years of operation are reported. The test results of the AEROMAN and the WINDMATIC plants are discussed as an example for the test methodology at Pellworm.

20216 (ISD—272) **Static and dynamic investigations for the model of a wind rotor.** Argyris, J.H.; Braun, K.A.; Kirchgaessner, B.; Walther, R. (Stuttgart Univ. (Germany, F.R.). Inst. fuer Statik und Dynamik der Luft- und Raumfahrtkonstruktionen). 1980. 64p. Available from Fachinformationszentrum Energie, Physik, Mathematik, Karlsruhe (Germany, F.R.).

A model of a wind rotor was constructed in order to develop and test a new data-acquisition and data-transport system. With this system it is possible to collect experimental data from the operating model and display them on a screen. The comparison between the experimental data and the computed results for the model can be used to check the applied computation methods. The static and dynamic analysis of the rotor model is discussed and the results are compared with experimental data. During the dynamic analysis a response problem with variable stiffness in time was found. For this problem a solution method for systems of equations is described.

20217 (Juel-Spez—71, pp 1-35) **Measurement system used at the Gedser windmill-purpose, performance and experience.** Lundsager, P. Mar 1980. Fachinformationszentrum Energie, Physik, Mathematik, Karlsruhe, Germany, F.R.

From 3. meeting of experts - data acquisition and analysis for large scale wind energy conversion systems; Blowing Rock, NC, USA (26 - 27 Sep 1979).

Summarized are the experiences gathered with the measurement system used in a series of measurements made on the Gedser windmill during the period Oct. 1977 - Apr. 1979. The layout of the system and the measurement procedures used are motivated and described, and the performance of the system is evaluated.

20218 (Juel-Spez—71, pp 37-55) **GROWIAN test program.** Hau, E. Mar 1980. Fachinformationszentrum Energie, Physik, Mathematik, Karlsruhe, Germany, F.R.

From 3. meeting of experts - data acquisition and analysis for large scale wind energy conversion systems; Blowing Rock, NC, USA (26 - 27 Sep 1979).

The large Wind Energy Plant GROWIAN is designed as a typical plant with respect to power output and technical design to deliver a considerable contribution to electric power need in the Federal Republic of Germany. This contribution should be achieved by a great number of identical units. Therefore GROWIAN is planned as a prototype and not as an experimental plant. On the other hand GROWIAN is of such a size, that a variety of technical problems is involved, which only can be solved experimentally. For this reason it is foreseen to carry out a test program in connection with the qualification phase. The outline of this test program has recently started. The objectives, the measurement methods and the hardware will be studied in more detail. The objectives of the test program are described with respect to the power output measurements.

20219 (Juel-Spez—71, pp 57-73) **Wind turbine data system.** Neustadter, H.; Wolf, R. Mar 1980. Fachinformationszentrum Energie, Physik, Mathematik, Karlsruhe, Germany, F.R.

From 3. meeting of experts - data acquisition and analysis for large scale wind energy conversion systems; Blowing Rock, NC, USA (26 - 27 Sep 1979).

Published in summary form only.

20220 (Juel-Spez—71, pp 75-108) **Evaluation of the prototype project of the Swedish wind energy programme.** Johansson, P.A. Mar 1980. Fachinformationszentrum Energie, Physik, Mathematik, Karlsruhe, Germany, F.R.

From 3. meeting of experts - data acquisition and analysis for large scale wind energy conversion systems; Blowing Rock, NC, USA (26 - 27 Sep 1979).

The prototype project is the major part of the Swedish wind energy programme. The project comprises concept studies followed by design, erection and evaluation of two large scale horizontal axis WECS. Together with other projects in the wind energy programme, the purpose of this project is to provide basic information for a possible decision in the direction of large scale utilization of wind energy in Sweden. This decision is scheduled to be made around 1985. The project has now reached the implementation phase.

20221 (Juel-Spez—71, pp 109-141) **Measuring program for two windmills at Nibe, Denmark.** Nielsen, P. Mar 1980. Fachinformationszentrum Energie, Physik, Mathematik, Karlsruhe, Germany, F.R.

From 3. meeting of experts - data acquisition and analysis for large scale wind energy conversion systems; Blowing Rock, NC, USA (26 - 27 Sep 1979).

Also presented at: IEA expert meeting on LS-WEC's, Sep 26-27, 1979, Boone, NC, USA.

After a short description of the two windmills being built at Nibe, Denmark, the main strategy for the measuring program is outlined. The physical lay-out of the measuring system is also described. Signals from about one hundred sensors are going to be processed in a PDP 11/34 computer, and the computed values are to be displayed on a printer/plotter or a CRT-screen. At the time of writing the mills have not been put into final operation, so practical results are not yet available.

20222 (Juel-Spez—71, pp 143-165) **Measurement of wind conditions and load in the GROWIAN project.** Koerber, F. Mar 1980. Fachinformationszentrum Energie, Physik, Mathematik, Karlsruhe, Germany, F.R.

From 3. meeting of experts - data acquisition and analysis for large scale wind energy conversion systems; Blowing Rock, NC, USA (26 - 27 Sep 1979).

Discussed are planned measurements on the German wind energy converter GROWIAN which will operate in the early eighties. GROWIAN is a large scale wind machine with 100 m tower and a 100 m two-bladed rotor. Rating is 3 MW. A survey is given on two themes treating wind conditions and load and stress on the machine and its components. There are as yet no experimental results available. Wind condition will be evaluated by an arrangement consisting of three wind measuring towers 150 m, respectively 160 m high. One standing 570 m in front of GROWIAN, a pair of towers standing 70 m in front. Strain gauges, accelerometers and other equipment are used for load and stress evaluation.

20223 (Juel-Spez—71, pp 167-186) **Review of gust model concepts.** Powell, D.C. Mar 1980. Fachinformationszentrum Energie, Physik, Mathematik, Karlsruhe, Germany, F.R.

From 3. meeting of experts - data acquisition and analysis for large scale wind energy conversion systems; Blowing Rock, NC, USA (26 - 27 Sep 1979).

Three wind component gust models, each representing a somewhat different concept, are reviewed.

20224 (Juel-Spez—71, pp 187-194) **Correlation of wind velocity and power output from field measurements on wind turbines.** Pedersen, B.M. Mar 1980. Fachinformationszentrum Energie, Physik, Mathematik, Karlsruhe, Germany, F.R.

From 3. meeting of experts - data acquisition and analysis for large scale wind energy conversion systems; Blowing Rock, NC, USA (26 - 27 Sep 1979).

A brief account is given of the problems involved in getting pertinent aerodynamic and aerodynamically derived characteristics of wind turbines from field measurements. In particular the methods for determining the proper power versus wind-speed correlation are reviewed.

20225 (Juel-Spez—71, pp 207-228) **Siting technologies for large wind turbine clusters.** Hiester, T.R.; Pennell, W.T. Mar 1980. Fachinformationszentrum Energie, Physik, Mathematik, Karlsruhe, Germany, F.R.

From 3. meeting of experts - data acquisition and analysis for large scale wind energy conversion systems; Blowing Rock, NC, USA (26 - 27 Sep 1979).

The objective of the U.S. Federal Wind Energy Program is '... to accelerate the development, commercialization and utilization of reliable and economically viable wind energy systems' (ERDA 1977). To achieve this objective, the program is organized into several elements. The Wind Characteristics Program Element (WCPE), one of these elements, is managed for the U.S. Department of Energy (DOE) by Pacific Northwest Laboratory (PNL). PNL has the specific responsibility for providing the appropriate information on wind characteristics to those involved in: Energy program planning and energy resource analysis; selection of sites for wind energy conversion systems (WECS); design and performance evaluation of WECS; day-to-day operations of WECS (Wendell et al. 1978). Applied research and development within the WCPE currently focus on: Developing effective siting technologies; defining the wind energy resource; providing information on wind structure and turbulence to designers; investigating wind-forecasting techniques that would improve the integration of wind turbines with existing electrical networks. This paper discusses the first of these activities as applied to large wind turbine clusters and describes a possible site-selection strategy for a large public utility that is considering the inclusion of WECS into its mix of generating equipment.

20226 (Juel-Spez—71, pp 229-245) **Two methods for correlating wind measurements with the power output of a 200 kw MOD-OA wind turbine.** Richards, T.R. Mar 1980. Fachinformationszentrum Energie, Physik, Mathematik, Karlsruhe, Germany, F.R.

From 3. meeting of experts - data acquisition and analysis for large scale wind energy conversion systems; Blowing Rock, NC, USA (26 - 27 Sep 1979).

1. Two methods (short term and long term) for correlating wind turbine power output and free-stream wind speeds have been presented. 2. Instantaneous correlation of power output with free-stream wind speeds is achieved using the short-term method. 3. Long-term correlation of measured and calculated average power while synchronized is achieved using the long-term method. 4. Both methods show good correlation between calculated and measured performance of the Clayton, New Mexico MOD-OA wind turbine.

20227 (Juel-Spez—71, pp 247-261) **Engineering assessment of existing wind models for the design of large WEC's.** Meggle, R. Mar 1980. Fachinformationszentrum Energie, Physik, Mathematik, Karlsruhe, Germany, F.R.

From 3. meeting of experts - data acquisition and analysis for large scale wind energy conversion systems; Blowing Rock, NC, USA (26 - 27 Sep 1979).

The designer of large WEC's is faced with the fact that the system he designs will be driven from the wind in the height region between 40 and 200 m. The bulk of existing wind data was measured in heights between 8 and 40 m. A survey is given of existing wind models to be applied to the mentioned operational height region. Critical assessment of the models validity is made and recommended areas for further investigations are identified.

20228 (Juel-Spez—71, pp 263-271) **DOE candidate site meteorological measurement program.** Renne, D.S. Mar 1980. Fachinformationszentrum Energie, Physik, Mathematik, Karlsruhe, Germany, F.R.

From 3. meeting of experts - data acquisition and analysis for large scale wind energy conversion systems; Blowing Rock, NC, USA (26 - 27 Sep 1979).

A primary goal of the U.S. Department of Energy (DOE) is the rapid commercialization of wind energy. One way that DOE is achieving this goal is by installing prototype wind turbines on sites proposed by electric service organizations. The utilities field test and operate these turbines for a period of several years and use the electricity produced by the turbines in their electrical network. In March of 1976, DOE issued an RFP to acquire, on a competitive basis, a group of candidate sites, proposed by utilities interested in the field testing program. Meteorological measuring equipment would be installed by DOE on these candidate sites to assess the wind energy potential at the site. As prototype machines reach a stage of development where an installation site is needed, a site would be chosen competitively from among these candidate sites. A total of 17 candidate sites were selected from the 64 proposals submitted in response to the RFP. From these sites, five have been chosen thus far to receive turbines for field testing. The meteorological measurement activities at these sites are discussed and details of the measurement program as it exists in late 1979 are provided. In addition, the directions this program will take in the near future, and the options interested electric service organizations have for participating in the program are discussed briefly.

20229 **(N—82-19681) Feasibility study on a low power vertical axis wind-powered generator.** Crook, W.R.; Puust, T.; Robinson, M.L.; Vencel, L.J. (Advanced Engineering Lab., Salisbury (Australia)). Sep 1980. 102p. NTIS, PC A06/MF A01.

Investigations carried out to establish a design concept for a 1 kW wind-powered generator suitable for use as an alternative power source in isolated locations is described. Design criteria include high power to weight ratio, simplicity of assembly, and potential for fixed, mobile or portable applications. A suitable configuration using a Darrieus straight blade rotor with a microprocessor based control system is proposed. Information on the power output to be expected in different wind environments is provided.

20230 **(NASA-SP—455) Capturing energy from the wind.** Schefter, J.L. (National Aeronautics and Space Administration, Washington, DC (USA)). 1982. 86p. GPO.

The history of the harnessing of wind power and basic facts about the wind and wind machines are discussed. The small machines, the large turbines, and the direction for the future are described. (MHR)

20231 **(NASA-TM—82594) Aluminum blade development for the MOD-OA 200-kilowatt wind turbine. Final report.** Linscott, B.S.; Shaltens, R.K.; Eggers, A.G. (National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center). Dec 1981. 43p. NTIS, PC A03/MF A01.

The rotor blade configuration, fabrication methods, analyses, operating experience, design modifications, and cost are described. Each 60-ft.-(18.3-m-) long aluminum blade used current aircraft fixed wing and rotary wing design and fabrication technologies. Structural damage, repairs, and modifications that occurred during 6500 hours of operation are summarized.

20232 **(NP—3900023) Rotor blade profiles for wind turbines.** Wortmann, F.X. (Stuttgart Univ. (TH) (Germany, F.R.). Inst. fuer Aerodynamik und Gasdynamik). Aug 1978. 22p. (In German). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83900023.

Requirements on blade profiles, suitable profiles, and results of measurements with small and large angles of attack are presented. Rough profiles, momentum coefficients, permissible roughnesses, and avoidance of roughness due to insect impact are mentioned.

20233 **(NP—3901233) Review of the literature on promotion of windpumps.** Rastogi, T. (Tata Energy Research Inst., Bombay (India). Documentation Centre). Jun 1982. 47p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE83901233.

A review of the literature on small windmills is presented with emphasis on: (1) use of the windmill for water pumping; and (2) use of the windmill in developing countries with limited funds and resources. Topics discussed include: (1) wind resources and availability; (2) status of the technology; (3) design and fabrication of windpumps; (4) economics; (5) social and environmental considerations; and (6) national and institutional measures. It is recommended that a wind resource inventory be undertaken in all countries having some wind energy prospects and that a centralized policy-making group should oversee all aspects of wind energy projects. 38 references. (MJJ)

20234 **(PNL-SA—10653) New look at turbulence experienced by a rotating wind turbine.** Connell, J.R.; George, R.L. (Pacific Northwest Lab., Richland, WA (USA)). Aug 1982. Contract AC06-76RL01830. 31p. (CONF-830108—3). NTIS, PC A03/MF A01. Order Number DE83007044.

From 6. ASME energy sources technology conference and exhibition; Houston, TX, USA (30 Jan 1983).

It is demonstrated that the wind that drives a wind turbine is correctly characterized only if the basic time series of wind is obtained by rotationally sampling the wind around the disc of the rotor. The approach that has been taken to characterize the rotationally sampled wind is described, and a set of simpler approximations are compared to the full rotationally sampled wind at a vertical plane array of anemometers. An example is given of the spectrum of rotationally sampled wind measured in the wake of a 200 kW MOD 0A1 wind turbine. A second example shows the importance of rotationally analyzing the wind before calculating probability density distributions of gust amplitudes. A theoretical model of the spectrum of the rotationally sampled wind is compared with an observed spectrum from the rotationally sampled wind at the vertical plane array of anemometers. (LEW)

20235 **(PNL-SA—10890) Operations requirements of utilities with wind-power generation.** Powell, D.C.; Chan, S.M.; Yoshimura, M.; Curtice, D.H. (Pacific Northwest Lab., Richland, WA (USA); Systems Control, Inc., Palo Alto, CA (USA)). Nov 1982. Contract AC06-76RL01830. 11p. (CONF-830107—3). NTIS, PC A02/MF A01. Order Number DE83007051.

From IEEE Power Engineering Society winter meeting; New York, NY, USA (31 Jan 1983).

A computational method and the necessary wind-speed data are presented in this paper for quantifying in a probabilistic framework the load-following, operating-reserve and unloadable-generation requirements for a utility with one or more spatially dispersed wind-turbine clusters. Results of this method are valid for random atmospheric conditions, excluding significant atmospheric events such as storm fronts. An example illustrating the proposed method is included.

20236 **(RFP—3383) Wind-systems technical notes: 1981.** Shuler, S.A. (comp.). (Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant). Mar 1982. Contract AC04-76DP03533. 214p. NTIS, PC A10/MF A01. Order Number DE83007202.

Eleven technical notes produced by the Rocky Flats Wind Systems Program in 1981 are compiled to document specialized tests of small wind systems and other investigations. Subjects include: controlled velocity tests, dynamometer tests, failure analysis, design of a digital speed control circuit for induction wind turbine generators and collection of wind turbine generator rpm data via an FM wireless intercom system.

20237 **(RFP—3449) Interfacing a Gemini synchronous (line-commutated) inverter with a local utility and a mini-grid: test results.** (Rockwell International Corp., Golden, CO (USA). Wind Energy Research Center). Oct 1981. Contract AC04-76DP03533. 52p. NTIS, PC A04/MF A01. Order Number DE83007198.

Data generated by interfacing a single-phase synchronous (line-commutated) inverter to a local utility and to a minigrid which simulated a 25 percent utility penetration are presented. Line-commutated synchronous inverters are used by some wind systems manufacturers for interfacing the direct current or rectified alternating current output of wind-turbine generators directly to utility ac power lines.

20238 **(SERI/TP—211-1851) Analysis of the potential of the electrofluid dynamic wind-driven generator.** Mitchell, R. (Solar Energy Research Inst., Golden, CO (USA)). Jan 1983. Contract AC02-77CH00178. 8p. (CONF-830405—10). NTIS, PC A02/MF A01. Order Number DE83005712.

From 6. annual ASME technical conference on commercial building heating and cooling applications; Orlando, FL, USA (19 Apr 1983).

The Electrofluid Dynamic wind-driven generator has been investigated under government supported programs since 1975. The concept features the direct conversion of wind energy into electrical power with virtually no moving parts. Research on this concept has resulted in a detailed operational theory of electrofluid systems and a preliminary conceptual design of a full-scale generator. Analysis of the potential of this concept has established a range for the value indicators and an understanding of its optimization potential and uncertainty. A comparison is made between the value indicators for the Electrofluid Dynamic concept and those of several conventional WECS.

20239 (SERI/TR—635-1280) **Windmill wake turbulence decay: a preliminary theoretical model.** Bossanyi, E.A. (Solar Energy Research Inst., Golden, CO (USA)). Feb 1983. Contract AC02-77CH00178. 31p. NTIS, PC A03/MF A01. Order Number DE83008162.

The results are given of initial theoretical attempts to predict dynamic wake characteristics, particularly turbulence decay, downstream of wind turbine generators in order to assess the potential for acoustic noise generation in clusters or arrays of turbines. These results must be considered preliminary, because the model described is at least partially based on the assumption of isotropy in the turbine wakes; however, anisotrpic conditions may actually exist, particularly in the near-wake regions. The results indicate that some excess spectral energy may still exist. The turbine-generated turbulence from one machine can reach the next machine in the cluster and, depending on the turbulent wavelengths critical for acoustic noise production and perhaps structural excitation, this may be a cause for concern. Such a situation is most likely to occur in the evening or morining, during the transition from the daytime to the nocturnal boundary layer and vice-versa, particularly at more elevated sites where the winds tend to increase after dark.

20240 (TR-EE—82-26) **Development of a reduced-order functional representation of an alternator-rectifier excitation system.** Chen, C. (Purdue Univ., Lafayette, IN (USA). School of Electrical Engineering). Aug 1982. Contract AC02-77ET29100. 70p. NTIS, PC A04/MF A01. Order Number DE83006437.

Excitation system models typically employed in power system computations are typically valid only for small changes in rotational speed and only for slowly varying system oscillations. Recent research has uncovered several situations where the range of accuracy associated with existing excitation system models is exceeded. A tractable, functional representation of a specific class of excitation systems is developed. The accuracy of this simplified model is evaluated by comparing the steady state and dynamic characteristics of the simplified model with a highly detailed excitation system representation. The simplified model is shown to be reasonably accurate over a wide range of operating conditions.

20241 (WAESD-TME—3180) **Investigation of doubly-fed machine in variable speed applications: control verification.** Andersen, T.S.; Hughes, P.S.; Mutone, G.A. (Westinghouse Electric Corp., Pittsburgh, PA (USA). Advanced Energy Systems Div.). Mar 1983. Contract AC02-81RA50292. 101p. NTIS, PC A06/MF A01. Order Number DE83008291.

The generator control system for a doubly-fed wind machine in variable speed applications is described. The control system has been assembled and its performance has been tested with a hybrid computer simulation of a wind turbine drive train. The generator is composed of an excitation controller and a cycloconverter controller. (LEW)

20242 (ANL/FE—80-10) **Sulfur control in fluidized-bed combustors: methodology for predicting the performance of limestone and dolomite sorbents.** Fee, D.C.; Myles, K.M.; Wilson, W.I.; Fan, L.S.; Smith, G.W.; Wong, S.H.; Shearer, J.A.; Lenc, J.F.; Johnson, I. (Argonne National Lab., IL (USA)). Sep 1982. Contract W-31-109-ENG-38. 448p. NTIS, PC A19/MF A01. Order Number DE83007658.

The ANL methodology significantly simplifies predictions of sulfur capture in fluidized-bed coal combustors. This section summarizes how to use the methodology to make predictions. The details of the method development and supporting data are given in the later sections. In addition, comparisons between predicted sorbent performance and actual FBC plant data are shown to support the methodology. The method adequately describes the experimental results and thus can be used with some confidence to compare sorbent performance, provided, of course, that the limitations of the methodology are recognized.

20243 (ANL/NESC—306) **FCC4; fundamental mode fast reactor cross section calculations.** Little, W.W.; Hardie, R.W. (Pacific Northwest Lab., Richland, WA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048306.

FCC4 will handle up to 40 energy groups and 10 downscattering terms with 14 isotopes.

FCC4 is a multipurpose data manipulation code for use in fast reactor analysis. The code can be used to - (a) compute resonance-shielded cross sections using data in the Russian format (shielding factors and infinite-dilution cross sections), (b) compute multigroup fundamental-mode flux and adjoint flux, (c) compute and punch group-collapsed microscopic or macroscopic cross sections in the DTF format, (d) compute fuel burnup at constant flux or power density.UNIVAC1108; FORTRAN IV; 65K memory.

20244 (ANL/NESC—914R) **PESTS; thermo-hydraulic system data analysis.** Bordner, G.L. (Argonne National Lab., IL (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048914.

PESTS is a statistical model for the analysis of steady-state thermo-hydraulic data from experimental loops or operating power plants. The analysis, based on estimation theory, provides a means for improving the accuracy of estimates of system parameters and for resolving small discrepancies in system heat balances. Additionally, when significant errors are present in the data, this model provides an indication of which sensors are suspect. User-supplied input to the PESTS (Parameter Estimation in Steady Thermal Systems) program consists of steady-state data from a thermo-hydraulic system along with error estimates for the sensors and a set of simple equations, such as component heat balances, which describe the system. Using statistical techniques, the program determines revised estimates of the system parameters which are more accurate than the raw data and which can be used as a basis for verifying the accuracy of individual sensors. PESTS was developed for the analysis of experimental data from the Sodium Loop Safety Facility (SLSF) but is adaptable to other systems.IBM370,303x; FORTRAN IV; OS/370; 70K bytes of memory are required for execution.

20245 (CONF-820966—2) **Review of gas cleanup systems for fluidized-bed coal combustors.** Henry, R.F.; Podolski, W.F.; Saxena, S.C. (Argonne National Lab., IL (USA); Illinois Univ., Chicago (USA). Dept. of Energy Engineering). 1982. Contract W-31-109-ENG-38. 8p. NTIS, PC A02/MF A01. Order Number DE83007711.

From 3. world filtration congress; Downington, PA, USA (13 Sep 1982).

In recent years, gas cleanup systems consisting of a number of cyclones, cyclones in conjunction with another device such as a fabric filter, granular bed, or electrostatic precipitator, have been used to remove particulates from the high temperature gas stream leaving fluidized bed coal combustors at both low and high pressure. These studies are reviewed here to infer the relative success of each type of cleanup system from the perspective of cleanup requirements for expansion of the gas through a gas turbine and additionally from the perspective of emission standards established by the Environmental Protection Agency.

20246 (CW-WR—76-020.104A) High-Temperature Turbine-Technology Program. Phase II. Technology test and support studies. Design and development of a regeneratively fuel cooled high temperature gas turbine combustor for operation on low Btu gas. (Curtiss-Wright Corp., Wood-Ridge, NJ (USA). Power Systems Div.). Jul 1982. Contract AC01-76ET10348. 167p. NTIS, PC A08/MF A01. Order Number DE83007342.

The fuel-air requirements for low Btu gas combustors result in a paucity of cooling air which results in low Btu gas-fueled air cooled combustor designs with annular configurations with complex flow path schemes to maximize cooling efficiency. These design trends are in the direction of reduced maintainability and reliability. Alternatively, if the low Btu gas can be utilized as a cooling medium before it is combusted, conventional multiple can arrangements with simple convection-cooled liner can be developed. This report describes the design, fabrication and test of a full scale industrial gas turbine burner can with convective cooling of the liner wall by 150 Btu/scf gaseous fuel typical of air-blown gasification of coal. The entire primary combustion zone burner wall surface area was cooled with 375°F LBG fuel, which after cooling the wall was reinjected for combustion. The fuel gas cooling passage is a concentric annulus of nominal .140" height, designed to limit linear temperature to a maximum of 1200°F at approximately 4% gas supply pressure loss. The 10-in. internal diameter combustor can was successfully operated up to 6 atmospheres pressure, burning 150 Btu/scf gaseous fuel up to 3000°F average exit temperature. The fuel cooling effect and combustor exit emissions levels were determined for gas supply temperatures of 150 and 375°F. All liner temperature measurements were well below the average 1200°F estimated for the 3000°F design point. This was confirmed by post-test visual inspection of all components which were found in excellent condition. In addition, the NO/sub x/ emissions level at the nominal 3000°F combustor exit temperature was substantially below the EPA regulatory level of 75 ppM when adjusted for pressure level effect of 15 atm and 15% oxggen.

20247 (DOE/AD/11209—T14) Final technical report on the development of cogeneration options at DOE facilities. (Vineta, Inc., Falls Church, VA (USA)). 21 Jan 1983. Contract AC01-81AD11209. 160p. NTIS, PC A08/MF A01. Order Number DE83005222.

This report summarizes professional services rendered by Vineta, Inc. in th development of viable cogeneration options at a number of DOE facilities. It describes in some detail the genesis of these projects and the lessons learned. Most importantly, it rank orders the projects under consideration in economic terms; all of them have very favorable return over investment ratios and payback periods. Bottoming cycles at the Richland 100 N Reactor show the greatest promise.

20248 (DOE/EIA—0035(82/10), pp i-vii) **Impacts of financial constraints on the electric utility industry.** O'Brien, B. (Energy Information Administration, Washington, DC). Oct 1982. NTIS, PC A06/MF A01.

In Monthly energy review.

Two possible futures for the utility industry through 1995 are examined to illustrate the potential impacts of financial constraints on the industry as a whole. In one case, it is assumed that electric utilities obtain the capital needed to finance all new construction currently planned and any additional powerplants justified by economics. In the second case, it is assumed that the current financial situation remains the same, and that electric utilities construct only those facilties for which they already have a major financial commitment. Projections of supply adequacy, utility fuel use, electricity prices, and capital expenditures are compared for each case.

20249 (DOE/EIA—0075(82/02)) Cost and quality of fuels for electric utility plants. (USDOE Energy Information Administration, Washington, DC. Office of Coal, Nuclear, Electric and Alternate Fuels). Feb 1982. 69p. NTIS, PC A04/MF A01. Order Number DE83008020.

This report is designed to provide information about the cost and quality of fossil fuels received at electric utility generating units in the 48 contiguous states and the District of Columbia. The publication is geared to a variety of applications by electric utilities, industry, consumers, educational institutions, and government in recognition of the growing importance of energy planning in contemporary society. This report contains fuel cost, quality, and quantity data aggregated at the state and regional levels beginning with Table 6, while 12-month tables are presented only at the regional level. Table 33 contains this information at the plant levels, listed alphabetically by company. In addition to steam-electric unit information, this report contains information on fuels received at peaking units: combustion turbines, internal combustion (diesel) engines, and combined-cycle units. Only fossil-fueled plants with a combined capacity of 25 megawatts or greater are covered in this report.

20250 (DOE/EIA—0075(82/03)) Cost and quality of fuels for electric utility plants. (USDOE Energy Information Administration, Washington, DC. Office of Coal, Nuclear, Electric and Alternate Fuels). Mar 1982. 66p. NTIS, PC A04/MF A01. Order Number DE83008019.

This report is designed to provide information about the cost and quality of fossil fuels received at electric utility generating units in the 48 contiguous States and the District of Columbia. It is also intended to provide information in a concise format to satisfy the needs of a wide variety of audiences. The publication is geared to a variety of applications by electric utilities, industry, consumers, educational institutions, and government in recognition of the growing importance of energy planning in contemporary society. This report contains monthly fuel cost, quality, and quantity data aggregated at the State and regional levels. 12-month tables are presented only at the regional level, with information at the plant level, listed alphabetically by company. In addition to steam-electric unit information, this report contains information on fuels received at peaking units: combustion turbines, internal combustion (diesel) engines, and combined-cycle units. Only fossil-fueled plants with a combined capacity of 25 MW or greater are covered. Data in the accompanying tables were compiled from monthly reports filed by electric utility companies.

20251 (DOE/EIA—0075(82/06)) Cost and quality of fuels for electric utility plants. (USDOE Energy Information Administration, Washington, DC. Office of Coal, Nuclear, Electric and Alternate Fuels). Jun 1982. 67p. NTIS, PC A04/MF A01. Order Number DE83008007.

This report is designed to provide information about the cost and quality of fossil fuels received at electric utility generating units in the 48 contiguous States and the District of Columbia. It is also intended to provide information in a concise format to satisfy the needs of a wide variety of audiences. The publication is geared to a variety of applications by electric utilities, industry, consumers, educational institutions, and government in recognition of the growing importance of energy planning in contemporary society. 20253 (DOE/EIA—0075(82/08)) **Cost and quality of fuels for electric utility plants.** (USDOE Energy Information Administration, Washington, DC. Office of Coal, Nuclear, Electric and Alternate Fuels). Aug 1982. 66p. NTIS, PC A04/MF A01. Order Number DE83008027.

This report is designed to provide information about the cost and quality of fossil fuels received at electric utility generating units in the 48 contiguous states and the District of Columbia. The publication is geared to a variety of applications by electric utilities, industry, consumers, educational institutions, and government in recognition of the growing importance of energy planning in contemporary society. This report contains monthly fuel cost, quality, and quantity data aggregated at the state and regional levels beginning with Table 6, while 12-month tables are presented only at the regional elvel. Table 33 contains this information at the plant level, listed alphabetically by company. Data for 1981 presented herein are revised and final. In addition to steam-electric unit information, this report contains information on fuels received at peaking units: combustion turbines, internal combustion (diesel) engines, and combined-cycle units. Only fossil-fueled plants with a combined capacity of 25 megawatts or greater are covered in this report.

20254 (DOE/EIA—0095(81)) **Inventory of power plants in the United States. 1981 annual.** (USDOE Energy Information Administration, Washington, DC. Office of Coal, Nuclear, Electric and Alternate Fuels). Sep 1982. 314p. NTIS, PC A14/MF A01. Order Number DE83008029.

Tabulated and graphic data for 1981 are presented on existing and projected US power plants. First, summary information is arranged by primary fuel, existing capacity, number of existing units, projected capacity, and number of projected units. Sections appear for the 50 United States and the District of Columbia, and for individual states listed in alphabetical order. Sections are also provided for summaries by NERC (National Electric Reliability Council) regions, census regions, and federal regions. Second, a comprehensive list of power generating units in the US and District of Columbia is presented with data on existing, projected, cancelled, shut-down, postponed, retired, and standby units. This information is categorized by state, company, plant and unit, in that order. Generating units are described by nameplate capacity, unit type, and primary and alternative fuel source. In addition information is provided on current operating status of units, as well as dates of initial production. Third, data are presented on jointly owned US power plants. The information is sub-divided by state, company, plant and unit. Names of joint utility owners and percentage of ownership are presented. Generating units are also described by nameplate capacity, unit type, primary and alternative fuel use, current operating status and dates of initial production. Finally, data are provided on planned or under construction power plants. The information is sub-divided by state, company, plant name, location, unit number, and current and originally scheduled completion date. In addition data is supplied on nameplate capacity, unit type, and primary fuel to be used. It is also possible to determine whether plant's environmental impact statement has been prepared, drafted, or is in final form. (LCL)

20255 (DOE/ER/10766—9) **Mitigation of biofouling using coatings, year 3. Quarterly progress report No. 1.** Meyer, A.E.; Fornalik, M.S.; King, R.W. (Arvin Calspan, Buffalo, NY (USA). Applied Technology Group). 20 Dec 1982. Contract AC02-80ER10766. 11p. NTIS, PC A02/MF A01. Order Number DE83004070.

Preliminary results (critical surface tension, final contact potential, and film thickness) of the freshwater experiments are given. The critical surface tension (γc) data are very similar to the results for the brackish Hudson River exposures: both the high energy and the medium energy surfaces acquired films having γc's in the 20's (dynes/cm) during the early stages of the experiment. These films were predominantly proteinaceous. As soon as mineral deposition was established, the γc's of all of the test surfaces increased to between 40 and 45 dynes/cm. In general, the final contact potentials of the test plates increased through time; the average values were 300 to 500 millivolts higher than those observed in the Hudson experiments. To date, all of the film thicknesses for the Niagara River experiments are 1000 Angstroms or less (even after 20 days of exposure). Plates exposed to the Hudson water acquired films of this thickness within only 5 days.

20256 (DOE/MC/14110—1227) **Alexandria fluidized-bed process-development unit. Hot-mode testing .** (Burns and Roe Services Corp., Oradell, NJ (USA); BENMOL Corp., Alexandria, VA (USA)). Dec 1982. Contract AC21-80MC14110. 205p. NTIS, PC A10/MF A01. Order Number DE83005061.

The objectives of the current test program include validation of predictions from the Massachusetts Institute of Technology (MIT) Atmospheric Fluidized Bed Coal Combustor System Model, continuation of experimental studies supporting AFBC process development, and collection of transient data for later process control studies. This topical report summarizes results from hot mode testing, i.e., experiments performed with combustion in the Process Development Unit for Model verification. During these tests, coal and limestone were fluidized and combusted with air at temperatures ranging from 1400 to 1580°F in the 3′ x 3′ (nominal) size Process Development Unit (PDU) at Alexandria, Virginia. MIT Model predictions tested include: combustion efficiency, carbon loading, gas and solids concentrations, bed temperature, expanded bed height, overall heat transfer coefficient and sulfur retention by the coal/limestone system. Although not corresponding exactly, the Model predictions and experimental values for the overall heat transfer coefficients were relatively close in agreement. In all other cases, there were some discrepancies between the Model predictions and corresponding experimental PDU results. Transient process data were collected by the Data Acquisition System (DAS). Six parameters were recorded continuously on a six channel recorder. Variances were observed in the recorded transient data in response to input step changes.

20257 (DOE/MC/14129—1312) **IEA Grimethorpe Pressurized Fluidised Bed Test Facility incident report: history of erosion on the primary and secondary quench vessel vent valves.** (NCB (IEA Grimethorpe) Ltd., Grimethorpe (UK)). Mar 1982. Contract AC21-80MC14129. 16p. NTIS, PC A02/MF A01. Order Number DE83005883.

The original vent valves installed on the primary and secondary quench vessels have experienced extensive internal erosion. The report provides details of the engineering work that has been undertaken to overcome the problem. Modifications were made to the valves during hot commissioning in order to reduce the erosive action, but these did not produce a significant improvement. During Test Series One, an alternative valve arrangement was installed which proved successful, and identical valves will be installed at the other locations for Test Series Two. The problem of erosion of the vent valves is likely to be specific only to the wet ash disposal system at the Grimethorpe Facility, as a commercial plant would probably utilize a dry system without the associated cyclone blowdown and venting requirement.

20258 (DOE/MC/14129—1313) **Fluidised-bed combustion: IEA Grimethorpe pressurized fluidized-bed test facility incident report - combustor water wall damage during operation on March 17, 1981.** (NCB (IEA Grimethorpe) Ltd., Grimethorpe (UK)). Apr 1982. Contract AC21-80MC14129. 19p. NTIS, PC A02/MF A01. Order Number DE83005881.

This report describes the incident of water leakage into the combustor during hot commissioning of the Facility in March, 1981. Leakage occurred from the water walls and the risers feeding the in-bed tube bank. It was concluded that air leakage through the seal arrangement, between te distributor plate and the water walls, impinged on the water wall and caused erosion tat led to failure.

Modifications were undertaken to improve the seal, which have proved satisfactory during Test Series I. Test Series II sees a change in design, with the seal being elimianted by the welding of the distributor plate directly to the water walls.

20259 (DOE/MC/14129—1314) Fluidised Bed Combustion Project, Grimethorpe Experimental Facility. (NCB (IEA Grimethorpe) Ltd., Grimethorpe (UK)). Mar 1982. Contract AC21-80MC14129. 24p. NTIS (US Sales Only). Order Number DE83005882.

The report presents the findings of an investigation into the freeboard cooler failure, in November 1981. The freeboard cooler was installed in the freeboard zone at the top of the combustor and the design intent was to operate so as to ensure the off-gas temperature did not exceed 900°C. During Test Series One, the freeboard temperature never reached 900°C, but the cooler was operated to reduce the exit flue gas temperature from the main heat exchanger to below the maximum allowable working temperature of the ductwork downstream of the exchanger. The cooler failed when several cracks appeared on bends in the air space between the combustor pressure shell and furnace water wall. A description of the cooler is provided along with details of its function, design, fabrication, commissioning and operation. The failure is described, and causes of failure are discussed. The report concludes that the failure occurred due to stress corrosion cracking.

20260 (DOE/MC/14129—1315) Fluidised-bed combustion: IEA Grimethorpe pressurized fluidised-bed test facility incident report - booster-compresser failure. (NCB (IEA Grimethorpe) Ltd., Grimethorpe (UK)). Apr 1982. Contract AC21-80MC14129. 19p. NTIS, PC A02/MF A01. Order Number DE83005865.

This report presents the findings of an investigation into the booster compressor failure, in October 1981. The compressor failed when a blade of the expander stage impeller fractured. The report concludes that the damage was probably caused by either the ingress of foreign particles or fatigue failure of the blade. Further metallurgical investigations of the damaged impeller would be required to try and determine the precise cause of failure. Erosion on the compressor stage impeller was most likely produced by the impact of moisture droplets or foreign particles. The function of the compressor is outlined, together with a description of the associated major components. The history of the unit is described from the design stage, through installation, commissioning and operation, to the time of failure. Details of the damage to the machine are recorded. Modifications to the system are recommended, in order to minimize the risk of similar damage occurring when the booster compressor is re-commissioned.

20261 (DOE/MC/14129—1316) Fluidised-bed combustion: IEA Grimethorpe pressurized fluidised-bed test facility incident report - performance of the exhaust-gas heat exchangers. (NCB (IEA Grimethorpe) Ltd., Grimethorpe (UK)). Apr 1982. Contract AC21-80MC14129. 36p. NTIS, PC A03/MF A01. Order Number DE83006560.

The report presents the findings of an investigation into the main heat exchanger performace and the modifications now being carried out on the Grimethorne pressurized fluidized-bed combustor. The heat exchanger was designed as part of the steam/wate circuit to cool the exhaust gas entering with a temperature in the range of 750 to 950°C to approximately 300°C at the outlet. During hot commissioning, it was noted that the gas outlet temperature from the heat exchanger was appreciably above design although the inlet temperature was substantially below design. An analysis of the calculated heat transfer coefficients derived from several hot commissioning runs for the tube banks within the exchanger, showed them to be more than 50% below the design values. Inspection of the exchanger revealed the tubes to be covered with dust deposits, which acted as insulation and accounted for the reduction in performance, apart from the difference in design and actual inlet conditions. The report provides a description of the heat exchanger in terms of its function and design. Operational aspects up to the completion of Test Series 1 are outlined, and details are given of the modifications taht are to be carried out prior to Test Series 2. A brief outline of the auxiliary heat exchanger and its performance is included.

20262 (DOE/MC/14129—1317) Fluidised-bed combustion: high-pressure combustor at Leatherhead, Test 5 - results. (National Coal Board, Leatherhead (UK). Coal Utilization Research Lab.). Nov 1982. Contract AC21-80MC14129. 68p. NTIS, PC A04/MF A01. Order Number DE83006385.

A fluidised bed combustor was built to investigate the effect of pressure (up to 20 atm) on combustion efficiency, sulphur retention, NO/sub x/ emission, heat transfer and elutriation. This report presents results from Test 5 which was carried out, burnig Pittsburgh No. 8 coal and Plum Run (dolomite) sorbent. The major change to the combustor compared with Test 4 was the use of a different tube geometry in an attempt to reduce the temperature drop through the tube bank was 140°F, very similar to that in Test 4. Combustion efficiency was 99% at 16 atm and 98 1/2% at 10 atm. Sulphur retention was 74 1/2% at 16 atm when the Ca/S ratio was 1.15 and 87% at 10 atm when the Ca/S ratio was 1.4. These low retentions and Ca/S ratios were the result of an unexpectedly high sulphur content of the coal, which varied between 5 and 7%. As a result of the high SO_2 emissions, SO_3 concentrations in the exhaust gas were high, typically 40 to 80 vppm, but rising to c. 300 vpm when the dolomite feed failed and SO_2 emmisions were in the range 1000 to 1500 vppm. Much more data are required before all the factors affecting SO_3 formation can be evaluated, but it is apparent that high SO_2 emission must be avoided when the pressure is high. NO/sub x/ emissions were 0.30 lb/10^6 Btu at 16 atm/65% excess air and 0.27lb/10^6 Btu at 10 atm/27% excess air-values which are consistent with earlier results.

20263 (DOE/MC/14129—1358) Fluidised-bed combustion: high-pressure combustor at Leatherhead, Test 6 - results. (National Coal Board, Leatherhead (UK). Coal Utilization Research Lab.). Dec 1982. Contract AC21-80MC14129. 61p. NTIS, PC A04/MF A01. Order Number DE83006380.

A fluidised bed combustor was built to investigate the effect of pressure (up to 20 atm) on combustion efficiency, sulphur retention, NO/sub x/ emission, heat transfer and elutriation. This report presents results from Test 6 which was carried out to assess te effect on temperature distribution of changing the tube bank geometry. Combustion efficiency was greater than 99% at 16 atm pressure (highest efficiency occuring at the higher bed temperature) and 98 1/2 to 99% at 10 atm pressure. Sulphur retention was about 93% when the Ca/S ratio was approximately 2.0 at both 16 and 10 atm pressure. There was a slight improvement when the bed temperature was increased. NO/sub x/ emissions were 0.33 lb/10^6 Btu at 16 atm pressure and 1560°F bed temperature, decreasing to 0.23 lb/10^6 Btu at the lower excess air when operating at 10 atm. Alklai vapour measurements indicated concentrations in the exhaust (at a temperature in the range 1500 to 1570°F) was 0.02 wppm Na and 0.03 wppm K. Gas sample traverses were made at two levels in the bed at most of the operating conditions. The main results from this test were compared with those from the earlier tests.

20264 (DOE/MC/19332—1319) Atmospheric fluidized-bed combustor design whose performance will significantly exceed conventional FBC operation performance. Final report. Hsiao, K.H.; Lin, Y.Y.; Guglietta, G.W.; Cares, W.R.; Fraley, L.D.; Schreiner, W.C.; Schlossman, M.; Solbakken, A. (Kellogg (M.W.) Co., Houston, TX (USA)). Dec 1982. Contract AC21-82MC19332. 228p. NTIS, PC A11/MF A01. Order Number DE83005062.

It is the goal of this project to bring forth a bench-scale design and test program to establish the merits of the circulating bed concept of atmospheric fluidized bed combustors (AFBC) and to show what the process development unit elements might be. The circulating fluid dynamics were modeled. From such a model the physical dimensions of a test system and the matrix for a test program can be established which will allow determination of parameters for scale-up evaluation of effectiveness and cost. This report presents an analysis of circulating bed boiler design methodology, alternative bench-scale designs for two coal feed levels (20 lbs/h and 80 lbs/h), including costs, and a test program. It is shown that the circulating bed concept has great merit for meeting DOE's advanced AFBC combustor criteria. A conceptual AFBC bench-scale design has been developed for an innovative AFBC system, specifically, a circulating bed boiler (CBB) for which two geometrically-similar designs, differing only in size, are presented.

20265 (DOE/PC/30214—T5) Heat transfer to tubes in freeboard space of fluidized-bed combustors. Progress report, August 1, 1982-February 1, 1983. Chen, J.C.; Tuzla, K.; Biyikli, S. (Lehigh Univ., Bethlehem, PA (USA). Dept. of Mechanical Engineering and Mechanics). Feb 1983. Contract FG22-80PC30214. 9p. NTIS, PC A02/MF A01. Order Number DE83006386.

Progress in experimental studies of the heat transfer characteristics of tubes located in the freeboard region of fluidized beds is reported. Tests will be performed in room temperature and high temperature (300 to 750°C) beds with various size bed particles and fluidization air flow rates. Heat transfer coefficient results for a bed temperature of 750°C and various flows and particle sizes and for a fixed size of sand particles with a range of bed temperatures and air flow rates are plotted. (LCL)

20266 (EPRI-EA—2059) Assessment methodology for new cooling lakes. Volume 1. Methodology to assess multiple uses for new cooling lakes. Final report. Porcella, D.B.; Grieb, T.M.; Bowie, G.L.; Ginn, T.C.; Lorenzen, M.W. (Tetra Tech, Inc., Lafayette, CA (USA)). Feb 1983. 245p. NTIS, PC A11/MF A01. Order Number DE83901462.

The Assessment Methodology for New Cooling Lakes has been developed to evaluate multiple uses of new cooling lakes, with emphasis on the recreational use of fish. The report consists of three volumes. In Volume 1 the stepwise method is presented in steps for evaluating recreational use potential of a new cooling lake based on the fish community characteristics of biomass, species composition, and harvest. First, a statistical model was used to classify a cooling lake into one of four groups of lakes having unique fish community characteristics. These groups were defined using limnological and fisheries data from existing cooling and noncooling lakes. Second, detailed analysis of the fish community and water quality factors was performed with an ecosystem simulation model. These results are evaluated with accepted methods for determining recreational demand and use projected with respect to nearby population centers. Finally, specific techniques for managing fish and wildlife habitat associated with cooling lakes are presented.

20267 (EPRI-EM—2861) Evaluation of superconducting magnetic energy storage systems. Final report. Lee, S.T.; Albert, R.S.; Imamura, D.T. (Energy Management Associates, Inc., Santa Clara, CA (USA)). Feb 1983. 85p. NTIS, PC A05/MF A01. Order Number DE83901465.

The study objective was to estimate the breakeven capital cost of Superconducting Magnetic Energy Storage (SMES) and its highest possible value. The results will be compared by EPRI to the capital cost of SMES being estimated by Bechtel in a related study. The best and most reasonable estimate of the SMES breakeven capital cost is 1080 $/kW in 1981 dollars. The highest possible value for an ideal SMES with perfect availability, zero refrigeration load and 100% incremental cycle efficiency is 1570 $/kW when installed in a utility approximately one-third of the US in size. Two methods of analysis are used. A single-year analysis that assigns an energy credit and a capacity credit to SMES provides the method for parametric and sensitivity analyses. A thirty-year life cycle analysis comparing SMES to a coal-fired generation alternative recognizes fuel cost escalation effects. The value of SMES to each of the six EPRI Regional Systems is computed. In comparison with pumped storage, SMES is worth 14% more to a utility.

20268 (EPRI-TI—2800-SR) EPRI Research and Development Projects. (Electric Power Research Inst., Palo Alto, CA (USA)). Dec 1982. 268p. NTIS, PC A12/MF A01. Order Number DE83901580.

This report lists all EPRI research projects and organizes them according to technical division, department, and program. For recently authorized projects and for ongoing projects, the research objectives are described, contractors are identifed, and reports are listed.

20269 (MTI—11290-1) Technology Demonstrator Engine (TDE). Period test report, August 1979-May 1981. Moynihan, T.; Rauch, J. (Mechanical Technology, Inc., Albany, NY (USA)). 1981. Contract AC02-76ET11290. 151p. NTIS, PC A08/MF A01. Order Number DE83002272.

This report documents the test results of a Free-Piston Stirling Engine (FPSE) linear alternator power conversion system. Testing of this system began in August 1979, and has continued through May 1981. The aim of the overall program was to develop a 1 kW(e) fossil fuel stationary power system. The design was completed in 1978, fabrication was completed in April 1979. Detailed results are presented for tests involving three different external heat-input systems: (1) the copper-block interface heating with the internally finned dome head; (2) the revised electrical resistance tubular heater head; and (3) the natural-gas-fired combustor system. A complete geometric description and performance prediction for Configurations 3 are given.

20270 (NASA-CR—168942) Study of reactor brayton power systems for nuclear electric spacecraft. (AiResearch Mfg. Co., Phoenix, AZ (USA); Jet Propulsion Lab., Pasadena, CA (USA)). Sep 1979. 169p. NTIS, PC A08/MF A01.

Prepared for JPL, Pasadena, Calif. Original contains color illustrations.

The feasibility of using Brayton power systems for nuclear electric spacecraft was investigated. The primary performance parameters of systems mass and radiator area were determined for systems from 100 to 1000 kW sub e. Mathematical models of all system components were used to determine masses and volumes. Two completely independent systems provide propulsion power so that no single-point failure can jeopardize a mission. The waste heat radiators utilize armored heat pipes to limit meteorite puncture. The armor thickness was statistically determined to achieve the required probability of survival. A 400 kW sub e reference system received primary attention as required by the contract. The components of this system were defined and a conceptual layout was developed with encouraging results. An arrangement with redundant Brayton power systems having a 1500 K (2240 F) turbine inlet temperature was shown to be compatible with the dimensions of the space shuttle orbiter payload bay.

20271 (NP—3900020) Load flow optimization in an electrical energy network by means of a searching technique with random numbers. Fuchs, F. (Stuttgart Univ. (Germany, F.R.)). 11 Jun 1980. 110p. (In German). NTIS (US Sales Only), PC A06/MF A01. Order Number DE83900020.

Thesis.

The need for an optimal energy supply demands the solution of a nonlinear optimization problem in which a large number of secondary conditions have to be considered. In this work a searching technique is developped that is using random numbers. Within a given range the control variables are altered stochastically. Is this yielding an improvement with respect to the target function, the new values of the control variables are used as the starting values for the next stochastic variations. The influences of the size of the sampling region, the number of control variables on the probability of a hit is investigated. The probability of a hit that is observed during the optimizing calculation is used for an optimal measuring of the sample region. Comparative calculations with other searching methods show that the stragety developped here is very powerful and is very simple structured. In contrary to the gradient technique, solely a target function is needed without its derivations, that does not have to be continuous or differentiable.

20272 (NP—3900021) Using parallel-computer systems to evaluate the dynamical protection of power networks. Mansour, W.M. (Technische Univ. Braunschweig (Germany, F.R.). Fakultaet fuer Maschinenbau und Elektrotechnik). 5 Dec 1979. 155p. (In German). NTIS (US Sales Only), PC A08/MF A01. Order Number DE83900021.

Thesis.

In this work the possibility is investigated to use a system of parallel comptuers in the performance of dynamic safety calculations of energy supply networks by means of known mathematical models for synchrotron generators. The investigations were conducted by using a computer of type SIEMENS 305. A model for the calculations consisting of 4 and 9 nodes shows that in modelling the machines according to the given machine model the computation time can be quite reduced, compared to usual computational techniques, by using the non-iterative computational technique and computation by means of a system of parallel computers, that is presented in this work.

20273 **(NUREG/CR—2518) Thermodynamic properties of water for computer simulation of power plants.** Kuck, I.Z. (Arizona Univ., Tucson (USA). Dept. of Nuclear Engineering). May 1982. 67p. NTIS, PC A04/MF A01.

Steam property evaluations may represent a significant portion of the computing time necessary for power system simulations. The iterative nature of the solutions for heat transfer and kinetic equations often requires thousands of steam property evaluations during the execution of a single program. Considerable savings may be realized by simplification of property evaluations. Empirical equations have been obtained for the thermodynamic properties of water in the region of interest. To maintain thermodynamic consistency, the compressibility factor Z, in terms of pressure and temperature, was obtained by curve fitting, and the enthalpy, entropy, and internal energy were derived by standard relationships. Formulations for heat capacity, saturation temperature as a function of saturation pressure, the specific volume of saturated water as a function of saturation pressure, and specific volume of saturated water as a function of the saturation temperature were determined by curve fitting of independent equations. Derivatives were obtained by differentiation of the appropriate formulations. Evaporator and superheater components of a liquid metal fast breeder reactor power plant simulator were chosen as test cases for the empirical representations. Results obtained using the empirical equations were comparable to those obtained using tabular values and required 24% less computing time.

20274 **(PB—82-217639) A european atomic energy Community Report. Part I: comparative risks from electricity generating systems. Part II: risk assessment of energy systems. Final report.** Bainbridge, G.R. (Commission of the European Communities, Luxembourg). [nd]. 126p. NTIS, PC AE06/MF E06.

An investigation has been carried out into the feasibility of making a meaningful comparison of the hazards associated with the generation of electricity from coal, oil and nuclear power. The existing literature on the risks associated with electricity generation is reviewed, and abstracts are provided of eight reports of special relevance. The recommended basis of comparison is the number of accidents involving death or injury and the number of delayed deaths from exposure to toxic substances per gigawatt year of electricity generated. Risk assessment should take into account the entire fuel cycle from the extraction of the fuel, its transportation to the power station, the construction of the power station and its machinery, to its actual operation, as well as dangers to the work force and members of the public, caused by explosions and the release of effluents, and finally, the disposal of waste.

20275 **(PB—82-229725) Evaluation of models for predicting evaporative water loss in cooling impoundments. Final report.** Helfrich, K.R.; Adams, E.E.; Godbey, A.L.; Harleman, D.R.F. (Massachusetts Inst. of Tech., Cambridge (USA). Energy Lab.). Mar 1982. 164p. NTIS, PC A08/MF A01.

Cooling impoundments can offer a number of advantages over cooling towers for condenser water cooling at steam electric power plants. However, a major disadvantage of cooling ponds is a lack of confidence in the ability to predict various aspects of their hydrothermal performance and consumptive water use. This report focuses on evaporation, which is related to both pond performance (temperature) and consumptive water use. A discussion of evaporation equations from both a theoretical and an empirical basis is presented. Several empirical evaporation equations falling into three basic categories-Dalton Law, Modified Dalton Law, and Stability Dependent - were compared to determine accuracy and confidence limits for evaporation from heated water bodies. Comparisons were carried out using MIT's dynamic cooling pond model MITEMP to evaluate the energy budget for six weeks of comprehensive meteorological and water temperature data taken at Dresden Cooling Pond in Illinois.

20276 **(PB—82-230905) Fluidized-bed combustion technology overview. Final report Dec 79-Dec 80.** Dowdy, T.E.; Klett, M.G.; Rubow, L.N.; Seth, R.G.; Milliken, J.O. (GCA Corp., Bedford, MA (USA). GCA Technology Div.). Apr 1981. 155p. NTIS, PC A08/MF A01.

The report reviews fluidized-bed combustion (FBC) technology development through 1979, specifying the work of governmental agencies and individual investigators, highlighting key technical issues, and documenting the current degree of FBC commercialization.

20277 **(PB—82-232372) An assessment of central-station congeneration systems for industrial complexes. Final report Mar 76-Mar 78.** Hilsen, N.B.; Fletcher, G.R.; Kelley, D.L.; Tiller, J.S.; Day, S.W. (Georgia Inst. of Tech., Atlanta (USA). Engineering Experiment Station). Apr 1982. 205p. NTIS, PC A10/MF A01.

This report assesses the potential for cogeneration system development based on an analysis of the economic, environmental, energy efficiency and social aspects of such systems. The cogeneration system is an application of the principle of cogeneration in which utility-sized power plants supply both electrical and steam needs to one or more nearby industries. Such a system can result in increased energy efficiency reduced pollutants, and reduced overall cost. A number of methodological approaches, including environmental impact analysis, were used to investigate the broad scope of issues relevant to cogeneration system development. As the study considered the subject from a general, comprehensive, planning-level perspective, the quantitative results cannot be applied to other sites. However, trends associated with the impacts of cogeneration development are identified, and methodologies which are applicable to cogeneration systems in general are employed.

20278 **(PB—82-237025) Ammonium sulfate and bisulfate formation in air preheaters. Final report Oct 80-Oct 81.** Burke, J.M.; Johnson, K.L. (Radian Corp., Austin, TX (USA)). Apr 1982. 270p. NTIS, PC A12/MF A01.

The overall goal of this study was to investigate the problems which result from deposition of ammonium sulfates in an air preheater. More specifically, the study had three major objectives. The first was to determine the conditions under which ammonium sulfates are expected to form. The second objective was to identify the factors which influence the formation of ammonium sulfates. The third objective was to identify and evaluate methods for preventing ammonium sulfate deposition/corrosion in air preheaters.

20279 **(PB—82-241605) Microprocessor-controlled ion selective electrode determination of total chlorine. Final report.** Howe, L.H.; Hadley, R.E.; Fischer, G.A. (Tennessee Valley Authority, Chattanooga (USA). Office of Natural Resources). Mar 1982. 200p. NTIS, PC A09/MF A01.

A microprocessor-controlled ion selective electrode (MC) method was evaluated and compared to the forward amperometric titration (AT) method for determining total chlorine in condenser cooling river water from coal-burning electric plants. The effective range for quantification by the MC method is from the minimum detection limit of 6.5 micrograms/l chlorine for unspiked condenser water and 13.3 micrograms/l chlorine for spiked condenser water to 100 micrograms/l chlorine. Interferences by zinc(II), copper(II), iron(III), arsenic(III), and manganese(VII) are discussed. The pH, chromium(VI), mercury(II), bromide, and arsenic(V) do not interfere with measurement of total chlorine. For both unspiked and spiked condenser water, the overall pooled standard deviation and overall mean percentage relative standard deviation over concentrations of 20-200 micrograms/l chlorine are lower for the MC method than for the AT method. Standard deviations are discussed for the MC method over concentrations of 2-20 micrograms/l chlorine.

20280 **(PB—82-256694) Feasibility of financial incentives to reuse low quality waters in the Colorado River Basin.** Milliken, J.G.; Lohman, L.C.; Howe, C.W. (Denver Research Inst., CO (USA)). Aug 1981. 94p. NTIS, PC A05/MF A01.

The cost-effectiveness of selected financial incentives for encouraging reuse of low quality/saline water collected by the U.S.

Bureau of Reclamation (USBR) system for electric power plant cooling is analyzed. Penalty costs to water users presently using saline waters for agricultural/domestic purposes and the potential economic benefits in salinity reduction are identified. Non-quantifiable salinity control benefits were identified as well, in terms of existing/potential beneficial water uses in the 7 Colorado River basin States and general amenity benefits. Reuse of saline water by an electric power utility could be a viable and cost-effective method of salinity control.

20281 (PB—83-114942) **Assessing safety in fossil fueled electric power generating plants. Final report.** Frezza, A.; Decker, D.A. (Bendix Corp., Cocoa Beach, FL (USA). Launch Support Div.). Sep 1978. 202p. NTIS, PC A10/MF A01.

The safety record of central electric power generating facilities utilizing fossil fuels as a primary energy source was evaluated. Records of 30 recent incidents which occurred during normal operation and maintenance and involving a safety problem were analyzed to determine their extent and magnitude. The commonality of occurrences and cause was also interpreted. The number of fatalities and injuries were minimal but property losses were high. There was no common cause or agent associated with incidents which involved fatalities or hospitalization. The author concludes that improved fire protection, loss prevention, life and personnel safety programs would significantly reduce the impact of safety related incidents.

20282 (TVA—3900545) **Availability and reliability improvement program.** (Tennessee Valley Authority, Chattanooga (USA). Div. of Power Production). 27 Jun 1978. 53p. NTIS, PC A04/MF A01.

The goal of TVA's Availability Improvement Program for its fossil-fueled power plants is to increase plant availability from 79 to 83%, to reduce the forced outage rate from 10 to 7%, and to reduce the equivalent outage rate related to forced deratings from 6 to 2%. As background for this program historical data on plant availabilities, trends toward improved availability, factors which contribute to current reliability, and ongoing programs to improve fossil-fueled plant reliability are discussed. (LCL)

20283 (TVA—3900546) **Fossil steam reliability & availability. Quarterly status report.** (Tennessee Valley Authority, Chattanooga (USA). Div. of Fossil and Hydro Power). 1981. 155p. NTIS, PC A08/MF A01. Order Number DE83900546.

Tabulated and graphic data are compiled on availability, reliability, and forced outages of fossil-fueled TVA power plants. (LCL)

20284 **Overvoltage protector using varistor initiated arc.** Brainard, J.P. (to Dept. of Energy). US Patent 4,365,282. 21 Dec 1982. Filed date 14 Feb 1980. vp.

PAT-APPL-121566.

Coaxial conductors are protected against electrical overvoltage by at least one element of non-electroded varistor material that adjoins each other varistor element and conductor with which it contacts. With this construction, overvoltage current initiated through the varistor material arcs at the point contacts between varistor elements and, as the current increases, the arcs increase until they become a continuous arc between conductors, bypassing the varistor material.

20285 **Use of steam coal in power stations.** New York, NY; United Nations (1982). 14p. .

The use of coal for power generation is discussed. The fall in oil consumption is considered likely to continue. Nuclear power will not realize its full potential whilst the problems of risk, public acceptance, financing, and construction delays remain. It is suggested that coal will continue to play a major role in electricity generation, though the current excess generating capacities of many countries may prove a severe constraint. Data on the use of steam coal in power stations is provided for most European countries, the U.S.A. and U.S.S.R.

20286 **(ORNL-tr—4958) Is the trend towards large power units in power-plant construction justified.** Buch, A. Translated from *Energie* ; **29**: No. 7, 198-204(1977). Contract W-7405-ENG-26. 24p. NTIS, PC A02/MF A01. Order Number DE83006739.

The numerous factors which influence the price and economics of power plants are examined in an effort to determine what power plant size is the cheapest to build and operate. These factors include costs for: licensing; environmental protection; site selection and development; design, construction, operation; and maintenance. After comparing the advantages and disadvantages of large units it is concluded that the purely thermal and financial comparison of profitability, based on the investigated power plant units themselves, reveals that the large unit capacities are 11% more advantageous economically than the smaller units up to a power division of 1:4. Dual-fuel capacity would not affect this conclusion, but the inclusion of cogeneration capability and of conditions at specific sites might argue in favor of smaller plants. (LCL)

20287 (CONF-800878—, pp 278-286) **Current status of dry flue gas desulfurization systems.** Kelly, M.E.; Dickerman, J.C. (Radian Corp., Durham, NC). 1980. Univ. of Pittsburgh, Dept. of Chemical and Petroleum Engineering, Pittsburgh, PA 15261.

From 7. annual international conference on coal gasification, liquefaction, and conversion to electricity; Pittsburgh, PA, USA (5 Aug 1980).

One of the major driving forces for development of dry SO_2 removal systems is the opportunity for reduction in both capital and operating costs. Although costs are quite site specific, the three types of dry FGD technologies considered here offer several potential possibilities for cost savings. This is due to the reduction in equipment and operation and maintenance requirements relative to conventional wet lime/limestone systems, especially in utility applications. The minimal equipment and operating requirements for dry injection systems make the process economically attractive as far as capital costs are concerned, but high sorbent requirements and uncertainties in sorbent availability and cost are slowing further development of the technology on a commercial scale. The application of spray dryer technology to higher sulfur coals may be subject more to economic rather than technological limitations. Higher stoichiometries are required for higher sulfur applications. Consequently, the reagent cost differential between lime and limestone may alone make a spray dryer based system uneconomical. Major restraints to the development of dry injection technology have been uncertainty in sorbent (nahcolite) availability, waste-disposal problems associated with sodium based salts and the relatively high flue gas temperatures required to achieve high SO_2 removals with calcium based sorbents. To date, only preliminary data exist for the SO_2 control effectiveness and operation of boilers firing either coal/limestone pellets or a pulverized coal/limestone fuel mixture.

20288 **(IIUG/dp—81-11) STEAG coal-fired power plant at Voerde or changing German clean air policy.** Knoedgen, G. (Wissenschaftszentrum, Berlin (Germany, F.R.). Internationales Inst. fuer Umwelt und Gesellschaft). 1981. 72p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE83750191.

In discussions on economic policy in the Federal Republic of Germany, frequent complaints are herd on billions of, invested marks being blocked by too much bureaucracy in licensing procedures, public protest and lengthy laws. This problem is the context in which the parent case report on the fossil fuel power plant at Voerde - probably the most well-known example in the Federal Republic of Germany for temporarily blocked investments in the power plant construction sector - must be seen. It seems to be particularly suited to elucidate the decision process of an undertaking that produces for a monopolized market and is associated with state institutions by capital holdings and common aims in energy policy.

The stubborn opposition of in principle, one citizen and some lawsuits in his favour prompted several law initiatives. In the authors' opinion, analysis of the case Voerde shows that attempts to check the blocking of investments by changing the licensing procedure can be dangerous. As participation of the public in licensing procedures and private claims to file lawsuits are practised. As democratic rights, the chances are that by retrenching such rights resistance is strengthened and the opposite effect obtained.

20289 **(NUREG/CR—2443) Manual for using energy analysis for plant siting.** Odum, H.T.; Lavine, M.J.; Wang, F.C.; Miller, M.A.; Alexander, J.F. Jr.; Butler, T. (Florida Univ., Gainesville (USA). Center for Wetlands). Feb 1983. 242p. NTIS, PC A11/MF A01 - GPO $7.50. Order Number DE83901456.

This is an instructional manual for choosing among possible sites for power plants by selecting the one with the least diversion of resources of the environment and of the economy. For each alternative site, changes of embodied energy in flows and storages are estimated in solar equivalent Calories. Then a dollar equivalent is estimated from the ratio of total solar equivalent flows to gross national product. Sample calculations are provided for LaSalle power plant west of Chicago considering alternatives of cooling reservoirs, cooling from a natural water body, and cooling towers. In order to facilitate calculation, an appendix provides procedures and data for evaluating embodied energy of the environment.

20290 **(PB—82-219353) Power plant site evaluation - Dickerson site. Interim report.** Eberhart, R.C. (Johns Hopkins Univ., Laurel, MD (USA). Applied Physics Lab.). Apr 1973. 249p. NTIS, PC A11/MF A01.

In accordance with Maryland's power plant siting legislation, as proposed by PEPCO, the expansion of the Dickerson plant will consist of two 850 MWe units fired by coal containing approximately 2% sulfur by weight and cooled by natural draft cooling towers. The cooling water is used for make-up Potomac River water drawn from the cooling water discharge canal of the existing Dickerson power plant and returned to the same canal. Possible environmental effects associated with fossil-fuel-fired plants such as the one proposed for Dickerson result from the impact of gases from the furnace and of a combination of waste-heat-related effluents on their surroundings. The most troublesome furnace products are sulfur dioxide, oxides of nitrogen, and particulate matter.

20291 **(PB—82-219361) Power plant site evaluation - Brandon Shores site. Interim report.** (Johns Hopkins Univ., Laurel, MD (USA). Applied Physics Lab.). 15 Nov 1972. 375p. NTIS, PC A16/MF A01.

This report examines potential environmental and ecological effects likely to result from the construction and operation of a power plant at Brandon Shores. The plant proposed by the Baltimore Gas and Electric Company is to consist of two 600 MWe units fired by residual oil and cooled by parallel path wet-dry cooling towers using Patapsco River water drawn from the current discharge canal of the adjacent H.A. Wagner power plant. Studies were conducted to characterize existing environmental conditions and to predict impacts expected from the new facility. Included in the assessment of potential impacts are (1) impacts of cooling system effluents on marine, land, and air environments; (2) effects of plant combustion effluents; and (3) pollant dispersion processes. Also described are compositions and concentrations of cooling tower chemicals and physical and chemical data from the Patapsco River Estuary, Maryland.

20292 **(PB—82-224726) Energy siting in Utah: a programming model.** Synder, D.L.; Keith, J.E.; Glover, T.F.; Wooldridge, G.L. (Utah State Univ., Logan (USA). Utah Water Research Lab.). Jun 1981. 61p. NTIS, PC A04/MF A01.

A study was conducted to examine the economically efficient allocation of resources between existing and proposed production entities, given resource and environmental constraints. The necessary conditions for an optimal input and output allocation were determined for a region constrained by resource availabilities and/or policy constraints, using a conceptual model of a multiple-product firm. A linear programming model was developed to determine optimal water allocation between agricultural and coal-fired power plants and the trade-offs which could occur if electrical generation were increased. Other potential trade-offs examined included coal source restrictions and air quality regulations. Also included were coal mining, transportation costs, and pollutant (SO2, nitrogen oxides, particulates) emission rates on a coal and plant basis.

20293 **(PB—82-227265) Combustion modification Nox controls for utility boilers. Volume I: tangential coal-fired unit field test. Final report Jul 78-Jul 79.** Higginbotham, E.B.; Goldberg, P.M. (Acurex Corp., Mountain View, CA (USA). Energy and Environmental Div.). Jul 1981. 158p. NTIS, PC A08/MF A01.

The report gives results of an environmental assessment field testing program on a tangential-coal-fired utility boiler. The aim of the program was to measure multimedia emissions changes as a result of applying combustion modification NOx control. Emissions of trace elements, organic materials, sulfur species, SO2, NOx, CO, and particulate matter were measured. These emissions were compared under normal and low-NOx operating conditions. Source operating data were also analyzed so that changes in operating parameters and efficiency could be assessed. The test were conducted on TVA's Kingston Steam Plant, Unit 6, a 180-MW, pulverized-coal, tangentially fired, electric utility boiler with a rated capacity of 582 Mg/hr (1.28 million lb/hr) steam. Burners-out-of-service and biased-burner firing were used for NOx control.

20294 **(PB—82-227273) Combustion modification Nox controls for utility boilers. volume II: pulverized-coal wall-fired unit field test. Final report Jul 78-Jul 79.** Sawyer, J.W.; Higginbotham, E.B. (Acurex Corp., Mountain View, CA (USA). Energy and Environmental Div.). Jul 1981. 187p. NTIS, PC A09/MF A01.

The report gives methods and results of an environmental assessment test program at Gulf Power's Crist Power Plant, Unit 7. The aim of the program was to measure multimedia emissions changes as a result of applying NOx controls. Emissions of trace elements, organic materials, sulfur species, particulate matter, CO2, O2, NOx, and CO were measured. These emissions, under normal and controlled (for NOx) operating conditions were compared. Source operating data were also analyzed so that changes in operating parameters and efficiency could be assessed.

20295 **(PB—82-227281) Combustion modification Nox controls for utility boilers. Volume III: residual oil wall-fired unit field test. Final report Jul 78-Jul 79.** Sawyer, J.W.; Higginbotham, E.B. (Acurex Corp., Mountain View, CA (USA). Energy and Environmental Div.). Jul 1981. 144p. NTIS, PC A07/MF A01.

The report gives methods and results of an environmental assessment test program at Pacific Gas and Electric's Moss Landing Power Plant, Unit 6. The aim of the program was to measure changes in emissions as a result of applying NOx controls. Emissions of trace elements, organic materials, sulfur species, particulate matter, CO_2, O_2, NOx, and CO were measured. These emissions, under as-designed and controlled (for NOx) operating conditions, were compared. Source operating data were also analyzed so that changes in operating parameters and efficiency could be assessed. Two degrees of NOx control were tested: the highest level, corresponding to present boiler operation, consisted of burners-out-of-service and flue gas recirculation (FGR) to the windbox; and the other, representing an intermediate degree of control, consisted of only FGR to the windbox.

20296 **(PB—82-230616) Harrington Station Unit 2 fabric filter system special testing report. Final report Dec 78-Jul 81.** Ladd, K.; Plunk, O.; Thurman, S.; Pinson, L.; Fajardo, L. (Southwestern Public Service Co., Amarillo, TX (USA)). Oct 1981. 153p. NTIS, PC A08/MF A01.

The report gives results of a special test program to determine mass emissions of particulate, SO_2, and NOx from a large utility baghouse controlling emissions from a boiler firing low-sulfur Western coal. The tests verified that NOx emissions, measured by EPA Method 7, were not significantly affected by the baghouse. Emissions of SO_2 measured consistently below the New Source

Performance Standard of 1.2 lb/million Btu at a level of about 0.8 lb/million Btu. Particulate tests indicated an average emission rate of 0.028 lb/million Btu. Overall test results indicate that Southwestern's Harrington Station, using low-sulfur and low-ash Western coal, can operate consistently within all applicable mass emission rates while using a fabric filter for air quality control.

20297 (PB—82-231150) EPA utility FGD survey: July-September 1981. Quarterly report. Smith, M.; Melia, M.; Gregory, N. (PEDCo-Environmental, Inc., Cincinnati, OH (USA)). Dec 1981. 365p. NTIS, PC A16/MF A01.

The report is the last of three supplements updating the October-December 1980 report (EPA-600/7-81-012a and -012b) and should be used in conjunction with it. The report, generated by a computerized data base system, surveys operational and planned domestic utility flue gas desulfurization (FGD) systems. It summarizes information contributed by the utility industry, process suppliers, regulatory agencies, and consulting engineering firms. It alphabetically tabulates domestic FGD systems by development status (operational, under construction, or in planning stages), utility company, process supplier, process, and waste disposal practice. It gives data on boiler design, fuel characteristics, FGD system design, and actual performance. It includes unit by unit dependability parameters and discusses problems and solutions associated with the boilers and FGD systems. Process flow diagrams and FGD systems economic data are appended.

20298 (PB—82-231267) Dual alkali acceptance test at Louisville Gas and Electric Company; Volume I. Acceptance test and appendices A-C. Final report Apr 79-Jul 80. Watson, D.; Martin, T.; Donnelly, J.; Zoueshtiagh, N. (Bechtel Corp., San Francisco, CA (USA)). Sep 1981. 109p. NTIS, PC A06/MF A01.

The report gives results of the completed acceptance test series run on the dual alkali system serving Louisville Gas and Electric Company's Cane Run Unit 6 boiler. This volume contains the process description and a discussion of the test results, operating history, and performance. Appendices A-C contain acceptance test daily summaries, monthly performance parameters, and Kenvirons' acceptance test reduced data.

20299 (PB—82-231275) Dual alkali acceptance test at Louisville Gas and Electric Company; Volume II. Appendices D-F. Final report Apr 79-Jul 80. Watson, D.; Martin, T.; Donnelly, J.; Zoueshtiagh, N. (Bechtel Corp., San Francisco, CA (USA)). Sep 1981. 407p. NTIS, PC A18/MF A01.

The report gives results of the completed acceptance test series run on the dual alkali system serving Louisville Gas and Electric Company's Cane Run Unit 6 boiler. This volume (Volume II) contains a discussion of the analytical and sampling methods, quality assurance, and the raw data gathered by Kenvirons.

20300 (PB—82-231283) Dual alkali acceptance test at Louisville Gas and Electric Company; Volume III. Appendices G-J. Final report Apr 79-Jul 80. Watson, D.; Martin, T.; Donnelly, J.; Zoueshtiagh, N. (Bechtel Corp., San Francisco, CA (USA)). Sep 1981. 375p. NTIS, PC A16/MF A01.

The report gives results of the completed acceptance test series run on the dual alkali system serving Louisville Gas and Electric Company's Cane Run Unit 6 boiler. This volume (Volume III) contains raw data gathered by Kenvirons, calculations, and computerized reduced data submitted to Bechtel by Kenvirons.

20301 (PB—82-234618) Sampling for high-molecular-weight organic compounds in power plant stack gases. Final report. Dickson, W.R.; Miller, H.C.; Barrett, W.J. (Southern Research Inst., Birmingham, AL (USA)). May 1982. 50p. NTIS, PC A03/MF A01.

The results of laboratory and field investigations of experimental sampling systems intended to collect high-molecular-weight organic compounds from flue gases in coal-fired power plants are presented. The most promising sampling device was a solid sorbent cartridge inserted directly into the flue gas stream and cooled to a temperature just above the dew point by a forced flow of external ambient air. Although certain sorbent materials were shown to be partially effective for the collection of vapors of polynuclear aromatic hydrocarbons at temperatures of 50 to 60C, no completely satisfactory sorbent was found. Ambersorb XE-340, a nonpolar carbonaceous sorbent, was the most satisfactory of several organic and inorganic sorbent materials tried, but its usefulness was limited by the presence of contaminants that could not be removed. The simplicity of the sampling system and the results obtained suggest that continuing efforts should be made to find a better sorbent material.

20302 (PB—82-237371) Studies of flue gas desulfurization at Louisville Gas and Electric's Paddy's Run Station: Volume I. Carbide and commercial lime testing. Final report Mar 75-Feb 1978. Hargrove, O.W. Jr; Behrens, G.P.; Corbett, W.E. (Radian Corp., Austin, TX (USA)). May 1982. 198p. NTIS, PC A09/MF A01.

The report gives results of tests to determine the technical factors accounting for the success of the flue gas desulfurization (FGD) system at Louisville Gas and Electric Co.'s Paddy's Run Unit 6. (Between its start-up in the Spring of 1973 and the Fall of 1976, the Unit 6 FGD system logged almost 4000 hours of operation without any major process or mechanical problem.) Test results indicate that carbide lime (a waste by-product of acetylene manufacture using calcium carbide), used at Unit 6, contains oxidation inhibitors that prevent gypsum scaling in the FGD scrubber. Commercial lime testing without these inhibitors resulted in gypsum scaling. However, adding magnesium (3000 ppm in the slurry liquor) reduced sulfite dissolution in the scrubber, thereby reducing sulfite oxidation and allowing scale-free operation. Increasing the chloride level increased sulfite oxidation; an increase in magnesium addition offset the effects of higher chloride levels. Lime systems can be operated successfully with low reaction tank residence times because of the rapid dissolution of lime. The size of the reaction tank and the lime addition point affect the crystal structure of the scrubber waste solids.

20303 (PB—82-237389) Studies of flue gas desulfurization at Lousiville Gas and Electric's Paddy's Run Station: Volume II. Review and analysis of commercial operations. Final report Mar 75-Feb 1978. Hargrove, O.W. Jr; Ottmers, D.M. Jr. (Radian Corp., Austin, TX (USA)). May 1982. 174p. NTIS, PC A08/MF A01.

The report gives results of tests to determine the technical factors accounting for the success of the flue gas desulfurization (FGD) system at Louisville Gas and Electric Co.'s Paddy's Run Unit 6. (Between its start-up in the Spring of 1973 and the Fall of 1976, the Unit 6 FGD system logged almost 4000 hours of operation without any major process or mechanical problem.) Test results indicate that carbide lime (a waste by-product of acetylene manufacture using calcium carbide), used at Unit 6, contains oxidation inhibitors that prevent gypsum scaling in the FGD scrubber. Commercial lime testing without these inhibitors resulted in gypsum scaling. However, adding magnesium (3000 ppm in the slurry liquor) reduced sulfite dissolution in the scrubber, thereby reducing sulfite oxidation and allowing scale-free operation. Increasing the chloride level increased sulfite oxidation; an increase in magnesium addition offset the effects of higher chloride levels. Lime systems can be operated successfully with low reaction tank residence times because of the rapid dissolution of lime. The size of the reaction tank and the lime addition point affect the crystal structure of the scrubber waste solids.

20304 (PB—82-240086) Impact of Nox selective catalytic reduction processes on flue gas cleaning systems. Final report Oct 80-Oct 81. Jones, G.D.; Glover, R.L.; Behrens, G.P.; Shirley, T.E. (Radian Corp., Austin, TX (USA)). Apr 1982. 103p. NTIS, PC A06/MF A01.

The report gives results of a study of the impact of the ammonia leaving a nitrogen oxide (NOx) selective catalytic reduction (SCR) process on downstream flue gas cleaning processes. (NOx emissions from electric utility boilers may be reduced 80-90% by the application of pollution control technology based on the SCR of NOx with ammonia; however, some unreacted ammonia may be emitted from the control system.) These processes include electrostatic precipitators (ESPs), baghouses, and flue gas desulfurization (FGD) systems. In normal operation, most ammonia leaving the SCR system will be removed, either as particulate salts by the particulate removal system or as free ammonia by the FGD system. Very little ammonia should be emitted at the stack. The operation of ESPs and FGD systems will, in most cases, be improved by the presence of ammonia in the flue gas. The effects of ammonia and ammonia salts on baghouse operation are not known. At normally expected emission levels, no adverse environmental impacts are projected; however, at high ammonia emission levels, the potential exists for problems with ammonia in the waste streams from fly ash and SO2 collection devices. Potential adverse environmental impacts exist in the ash and sludge ponds where collected ammonia may be concentrated and emitted as a gaseous pollutant.

20305 **(PB—82-249350) Environmental assessment of stationary source Nox control technologies. Final report Jun 76-Sep 79.** Waterland, L.R.; Lim, K.J.; Higginbotham, E.B.; Evans, R.M.; Mason, H.B. (Acurex Corp., Mountain View, CA (USA)). May 1982. 339p. NTIS, PC A15/MF A01.

The report summarizes results of a 3-year evaluation of combustion modification controls for emissions of NOx and other pollutants from stationary combustion sources. Results include field tests of gaseous, liquid, and solid effluents from seven stationary sources; estimates of environmental effects of using combustion modification control; evaluation of NOx control reduction effectiveness, capital and operating costs, and operational impact for several levels of control; projection of control technology needs to the year 2000 for several scenarios of energy growth and environmental regulations; and inventories of nationwide stationary source emissions for major pollutants and emission projections to the year 2000. Three utility boilers, two industrial boilers, a gas turbine, and a low-emission residential heating system were tested. The utility boiler tests on two coal-fired systems and one oil-fired boiler, showed NOx emission level reductions of 30-43% using various combustion modification techniques; however, the same tests showed that other emissions were essentially unchanged. Similarly, tests on the other types of equipment showed that modifications to reduce NOx left emissions of other species unchanged or lower. In some cases, where emissions were increased, the environmental effect was counter-balanced by the beneficial effects of NO reduction.

20306 **(PB—82-257650) Long-term benthic monitoring programs for the mesohaline Chesapeake Bay. Interim report.** Hiegel, M.H.; Fisher, K.; Johnson, G.F. (Martin Marietta Corp., Baltimore, MD (USA). Environmental Center). Apr 1982. 83p. NTIS, PC A05/MF A01.

This report presents a summary of data collected and an updated progress report for a long-term benthic study conducted to measure the long-term effects of power plant operations on benthic populations and to identify long-term trends and annual cycles in these populations. Benthic organisms and the physical/chemical characteristics of sediments and water were sampled between July 1981 and May 1982 in the mesohaline portion of the Chesapeake Bay and the Potomac estuary. The surveys were concentrated near the Morgantown and Calvert Cliffs, Maryland power plant. Salinities during 1981-1982 were high relative to long-term salinity records with the deviation from average salinities being larger in the Potomac than the mainstem of the Bay.

20307 **(PB—83-117804) EPA utility FGD survey, October-December 1981. Volume I. Categorical summaries of FGD systems. Volume II. Design and performance data for operational FGD system. Quarterly report.** Melia, M.T.; Bruck, N.G. (PEDCo-Environmental, Inc., Cincinnati, OH (USA)). Sep 1982. 1289p. NTIS, PC A99/MF E08.

The report is the first full compilation (not a supplement) since the October-December 1980 report (EPA-600/7-81-012a and -12b). Because the next three reports are to be supplements, this issue should be retained for reference throughout the year. The report, generated by a computerized data base system, presents a survey of operational and planned domestic utility flue gas desulfurization (FGD) systems. It summarizes information contributed by the utility industry, process suppliers, regulatory agencies, and consulting engineering firms. Domestic FGD systems are tabulated alphabetically by development status (operational, under construction, or in planning stages), utility company, process supplier, process, and waste disposal practice. It presents data on boiler design, FGD system design, fuel characteristics, and actual performance. Process flow diagrams and FGD system economic data are appended. Section 3 of the report, because of its length, appears in Volume II.

2003 Power Transmission And Distribution

REFER ALSO TO CITATION(S) 20268, 20824

20308 **(DOE/SF/00515—T2) Power-supply-operations group-training programs, ac/dc power systems and micellaneous information.** Harris, C.A. (Stanford Linear Accelerator Center, CA (USA)). 30 Jun 1978. Contract AC03-76SF00515. 68p. NTIS (US Sales Only). Order Number DE82014965.

This program introduces the technician to three phase a-c power and its relationship to rectifier power conversion systems. A brief introduction is given as to the engineering significance of various parameters such as, phase rotation, ac power relationships, harmonics, transformer voltage vectors, rectifier parameters, filters, water cooling, phase delayed triggers to SCR's, dielectric stress vs life and other related subjects. The significance of the details as they apply to various diagnostic problems that a technician may be called upon to solve is emphasized. Reference CAPE-2747.

20309 **(ORNL—5898) Advanced power-conversion concepts for HVDC transmission systems.** Jewell, W.T. (Oak Ridge National Lab., TN (USA)). Jan 1983. Contract W-7405-ENG-26. 33p. NTIS, PC A03/MF A01. Order Number DE83008141.

Increasing complexity of high-voltage direct current (HVDC) transmission systems places new demands on alternating current/direct current (ac/dc) power converters. The possibility of using advanced power conversion techniques, specifically force-commutated conversion, is discussed. Previous work on this concept and some studies and development of low-voltage advanced converters are reviewed, and recommendations are made for future work. Advanced converters have been successfully used to feed ac distribution systems at megawatt power levels, and results of previous studies of the use of such converters in HVDC systems have been favorable. However, these studies condidered only one type of advanced converter, and further work should consider the wide variety of available designs. Further work is justified by the increasing complexity of HVDC systems. Recommended further work includes computer simulation studies, a survey of the future availability of solid-state switching devices, a review of advanced converter designs, and finally, the actual design of an HVDC converter that uses advanced conversion concepts.

20310 **(ORNL/TM—8484) High-voltage-gradient zinc oxide varistors: fabrication and properties.** Lauf, R.J. (Oak Ridge National Lab., TN (USA)). Mar 1983. Contract W-7405-ENG-26. 22p. NTIS, PC A02/MF A01. Order Number DE83008137.

Zinc oxide varistors have many properties that make them attractive as surge arrestors or voltage limiters in high-voltage power transmission systems. The electrical characteristics are influenced by the ZnO grain size, and reducing the grain size would allow the entire device to be much smaller. The practical advantages of smaller arrestors are particularly important for underground transmission lines. Advanced ceramic processing techniques were used to fabricate ZnO varistors having grain sizes in the 3- to 4-μm range, compared to 7 to 13 μm in commercial devices. The fine-grained varistors exhibited high breakdown voltage gradients, compared to commercial materials. Processing steps included synthesis of highly active powders by sol-gel techniques and hot pressing in a reducing environment to achieve high density at temperatures below about 800°C. Heat treatment in air at temperatures up to 1000°C fully developed the nonohmic electrical properties.

20311 **(PB—82-206905) Characteristics of an equidistant firing system in 12-pulse converter bridges for HVDC.** Juslin, K.; Laiho, Y.; Vauhkonen, V. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland). Saehkoetekniikan Lab.). May 1981. 33p. NTIS, PC A03/MF A01.

This research paper deals with the construction of a simulation model for a twelve pulse HVDC transmission line. The realized equidistant pulse phase control system is suitable for the operation in weak or strongly unbalanced ac systems from the viewpoint of harmonic instability and suppression of abnormal harmonic currents. The phase of the firing pulses is proportional to an absolute level of the control voltage, and the operation with a constant control angle is possible. The synchronism with an ac system is guaranteed by a phase-locked loop, not by the main control loop. Thus quick and ideal response is obtained. The measurements have shown that this kind of grid control is stable also in many faulty conditions. Abnormal harmonic generation of the converter is very small compared with the traditional systems by utilizing this kind of grid control.

20312 **(PB—82-209776) Analysis of the calibration of metering CCVTS in a utility substation. Final report.** Hillhouse, D.L.; Leep, D.A. (National Bureau of Standards, Washington, DC (USA). Center for Building Technology). Oct 1981. 55p. (NBSIR—81-2360). NTIS, PC A04/MF A01.

This report presents the results of an investigation of unexpected variations in nine 500 kV metering CCVTs, tested for Gulf States Utilities at Baton Rouge, LA. These measurements were performed on three occasions - May 1979, March 1980, and December 1980.

20313 **(PB—82-215419) A simplified system for calibration of CCVTS in the substation. Final report.** Hillhouse, D.L.; Petersons, O.; Sze, W.C. (National Bureau of Standards, Washington, DC (USA)). May 1982. 61p. (NBS-TN—1155). NTIS, PC A04/MF A01.

Coupling capacitor voltage transformers (CCVTs) are widely used for the revenue metering of energy exchanged between utilities at EHV (345-500 kV) interties. These devices are installed permanently in substations, and must be calibrated there. Allowable error is plus or minus 0.3 percent and plus or minus 4.6 mrad (milliradians). This report describes a simplified, lighter, and less costly CCVT calibration system, newly developed and field tested by NBS. The principal elements of this system are a portable reference standard transformer and moderate voltage power supply (14.4 kV), a modular capacitive transfer standard divider, and a voltage comparator. Results obtained with this system agree with the prototype to within plus or minus 0.03 percent and plus or minus 0.1 mrad.

20314 **Adhesive coated electrical apparatus having sublimable protective covering and an assembly method.** Wootton, R.E. (to Dept. of Energy). US Patent 4,343,964. 10 Aug 1982. Filed date 19 Jan 1981. vp.

PAT-APPL-226330.

Electrical apparatus including an enclosure, an electrode disposed within the enclosure, and supports for insulatably supporting the electrode within the enclosure has a permanently sticky adhesive material which is disposed on the interior surface of the outer enclosure. A high-vapor-pressure sublimable material is disposed on the permanently sticky adhesive material, with the sublimable material capable of subliming away in the presence of a vacuum. The presence of the sublimable material enables the apparatus to be nonsticky during assembly and handling operations, while being rendered sticky upon commissioning of the apparatus.

20315 **(OA-tr—2543) Electric power for the island of Borkum.** Becker, T.; Fusen, H.; Moormann, G. Translated from *Elektrizitaetswirtschaft* ; **81**: No. 8, 241-246(13 Apr 1982). 22p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83900469.

In 1980, the power supply to the North Sea island of Borkum was upgraded by the connection of a 30 kv underwater cable. The entire operation is detailed including planning, the construction of the PE insulated cable, the production and testing of the cable, and cable laying.

21 NUCLEAR POWER PLANTS

REFER ALSO TO CITATION(S) 20254, 20268, 20625, 20627, 20818, 20819, 20820, 20821, 20823

20316 **(NUREG/CR—2952) Engineering expertise on shift in nuclear power plants: the foreign experience.** Melber, B.D.; Schreiber, R.E. (Battelle Human Affairs Research Center, Seattle, WA (USA); Pacific Northwest Lab., Richland, WA (USA)). Feb 1983. Contract AC06-76RL01830. 35p. (PNL—4468). NTIS, PC A03/MF A01 - GPO $4.50. Order Number DE83008250.

This report describes the practices of selected foreign countries with providing engineering expertise on shift in nuclear power plants. The extent to which engineering expertise is made available and the alternative models of providing such expertise are presented. The implications of foreign practices for US consideration of alternatives are discussed, with reference to the shift technical advisor (STA) position and to a proposed shift engineer position. The procedure used to obtain information on foreign practices was primarily a review of the literature, including publications, presentations, and government and utility reports. There are two approaches that are in use to make engineering expertise available on shift: (1) employing a graduate engineer in a line management operations position; and (2) creating a specific engineering position for the purpose of providing expertise to the operations staff.

20317 **(SAND—82-2852C) Tactical Improvement and Security Force Evaluation Program.** Chapman, L.D.; Adams, K.G.; Rountree, S.L.K.; Heider, J.A.; Wilde, R.L.; Baehr, D.G. (Sandia National Labs., Albuquerque, NM (USA)). 1983. Contract AC04-76DP00789. 6p. (CONF-830416—1). NTIS, PC A02/MF A01. Order Number DE83007409.

From American Nuclear Society workshop on power plant security; Savannah, GA, USA (24 Apr 1983).

Sandia National Laboratories has worked on the Tactical Improvement and Security Force Evaluation Program for the US Nuclear Regulatory Commission (NRC). This program demonstrates the feasibility of using the Engagement Simulation System (ESS) for security officer response training at licensee nuclear power plants. The ESS, which evolved from Xerox's Multiple Integrated Laser Engagement System (MILES), utilizes weapons with laser transmitters and body harnesses with laser sensors to simulate adversary engagement conditions. The information required by the licensee to utilize the ESS for security officer training is in the form of a Tactical Improvement Package (TIP) which contains two Instructor's Guides. Sandia National Laboratories has made an explanatory film which provides the highlights of the Tactical Improvement and Security Force Evaluation Program. It relates the observation of ESS familiarization exercises conducted at four nuclear power plants to the information given in the TIP documentation and explains the history of the program. It is the intent of the authors for this film to serve as the presentation medium for this paper.

2101 Power Reactors, Non-breeding, Light-water Moderated, Boiling Water Cooled

REFER ALSO TO CITATION(S) 20450, 20452, 20457, 20463, 20477, 20554, 20654, 20656, 20680, 20681, 20683, 20684, 20689, 20691, 20693, 20712, 20718, 20719, 20721, 20722, 20723, 20729, 20730, 20733, 21876

20318 **(ANL/NESC—246) FLOW-MODEL; multi-channel two-dimensional, two-phase flow.** Perry, G.W. (Argonne National Lab., IL (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048246.

Maxima of - 20 channels 100 axial nodes 100 axial 1 points.

FLOW-MODEL is a multi-channel, two-dimensional, two-phase flow model designed to compute the axial and radial coolant density and quality profiles, the axial pressure profile, and the weight flow distribution for an open matrix flow, boiling water reactor.IBM360;CDC CYBER73;CDC6600,7600; FORTRAN IV; OS/360 (IBM360), SCOPE (CDC6600,7600), NOS 1.3 (CDC

CYBER73); 240K bytes of memory are needed for the IBM360 version. The CDC CYBER73 version requires 47,000 (octal) words of memory on the CDC6600 and 35,000 (octal) words of memory on the CDC7600.

20319 **(ANL/NESC—328) NURLOC-1.0; loss-of-coolant thermal analysis.** Walters, C.T. (Battelle Columbus Labs., OH (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048328.

Two-dimensional analyses, either single pins or cylindrical shells, are performed.

NURLOC-1.0 performs core/pressure vessel thermal analysis for a nuclear reactor loss-of-coolant accident.CDC6400; FORTRAN IV; SCOPE; 65K or 32K memory with overlay.

20320 **(ANL/NESC—369) RELAP4/MOD6; transient thermal-hydraulic study.** Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Tolli, J.E. (EG and G Idaho, Inc., Idaho Falls (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048369.

Maxima of - 9 minor edit variables 20 time-step cards 20 trip control cards 100 junctions (flow paths) between volumes 5 bubble-parameter sets 5 time-dependent volume descriptions on cards 12 pumps 75 control volumes 10 check valve types 5 normalized leak-area-versus-time curves 20 fill system curves 50 heat slabs 20 heat slab geometries 7 heat slab materials 50 core sections 99 data sets for heat exchangers without conduction.

RELAP4 has been developed to describe the behavior of water-cooled nuclear reactors subjected to postulated transients, such as those resulting from loss-of-coolant, pump failure, or power excursions. The program calculates fluid conditions such as flow, pressure, mass inventory, and quality; thermal conditions such as surface temperatures, temperature profiles, and energy distributions; and heat fluxes in power generating and dissipating elements. The program also calculates reactor power, decay heat, and reactivity. In addition to describing transients in boiling-water and pressurized-water reactors, the program is sufficiently versatile to describe transients in experimental thermal-hydraulic systems. RELAP4/MOD6 was developed specifically to add a capability to the earlier RELAP codes for calculating PWR reflood phenomena.IBM360,370;CDC7600; FORTRAN IV (95%) and BAL (5%) (IBM360), FORTRAN IV (95%) and COMPASS (5%) (CDC7600); OS/360,370 (IBM360,370), SCOPE (CDC7600); 850K bytes (IBM360), 160,000 (octal) words of SCM and 200,000 (octal) words of LCM (CDC7600), 3 tape drives, and a CalComp plotter.

20321 **(ANL/NESC—461R) EPOCH; neutron age calculation of ENDF/B data.** Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Schmidt, E. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048461.

The maximum number of groups is 2000 and the maximum number of ENDF/B materials is 10 (or 5 in age calculations). The number of center-of-mass elastic scattering moments read from ENDF/B must be less than 7. The resonant cross sections for any material are ignored.

EPOCH solves for fine detail P1 flux spectra in simply-buckled media and is able to calculate neutron ages from the spectra. It obtains nuclear cross sections from the ENDF/B library, ignoring resonance files, and is most useful for higher energies where resonant reactions are weak or absent. The present version reads only ENDF/B Version 1 tapes.CDC6600; FORTRAN IV; SCOPE 3.1; 140K (octal) memory and 1720K (octal) extended core storage. The amount of extended core storage can be readily reduced for most problems.

20322 **(ANL/NESC—483) REPP; thermal-hydraulic water reactor design.** Hiatt, R.M.; Bromley, C. (Pacific Northwest Lab., Richland, WA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048483.

The REPP computer code provides a method for (1) evaluating fuel temperatures and critical heat flux margins for a fixed reactor core and fuel design, (2) determining the number of fuel pins required to maintain specified heat flux margins from burnout at a given reactor power level, (3) determining the diameter of a fuel pin to design within fuel centerline temperature limits at a specified reactor power level, (4) evaluating the sintering effect on fuel temperature, (5) calculating pressure drop and coolant properties for single-phase and two-phase flow for fuel operating at average reactor conditions and a theoretical hot-pin hot-channel condition, and (6) calculating pressure drop across several types of fuel pin spacers.UNIVAC1108; FORTRAN V; CSCX; 51K addressable core storage.

20323 **(ANL/NESC—512) THETA1B; fuel rod thermal response loss of coolant accidents.** Hocevar, C.J.; Wineinger, T.W. (EG and G Idaho, Inc., Idaho Falls (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048512.

Small time-steps are used, resulting in long running times.

THETA1B computes the thermal response characteristics of a nuclear fuel rod subjected to a loss-of-coolant accident environment.IBM360/75; FORTRAN IV; OS/360; 400K bytes of core memory are required.

20324 **(CONF-810234—2) Two-fluid model formulation and drag correlation for dispersed two-phase flow.** Ishii, M. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 12p. NTIS, PC A02/MF A01. Order Number DE83007778.

From Army Research office workshop on multiphase flow; Aberdeen Proving Ground, MD, USA (2 Feb 1981).

A two-phase flow model can be developed by applying a proper averaging method to a local instant formulation. In a macroscopic formulation based on the averagings, collective interactions of fluid particles and dynamics of the interfaces are modeled through the phase interaction terms. There are two fundamentally different formulations of the macroscopic two-phase flow model, namely, the two-fluid model and mixture model. The two-fluid model is formulated by considering each phase separately in terms of two sets of macroscopic conservation equations governing the balance of mass, momentum and energy of each phase. In the two-fluid model, two momentum equations describe the motions of phases. However, in the macroscopic field, motions of phases are not independent of each other, therefore, the interfacial momentum interaction terms should be specified in the model. Since these momentum interaction terms play the key role in the two-fluid model, they are studied in detail in this paper.

20325 **(CONF-820510—6) Fission reactors and materials.** Frost, B.R.T. (Argonne National Lab., IL (USA)). Dec 1981. Contract W-31-109-ENG-38. 11p. NTIS, PC A02/MF A01. Order Number DE83007595.

From Spring meeting for the Society for the Advancement of Materials and Process Engineering; San Diego, CA, USA (4 May 1982).

The American-designed boiling water reactor and pressurized water reactor dominate the designs currently in use and under construction worldwide. As in all energy systems, materials problems have appeared during service; these include stress-corrosion of stainless steel pipes and heat exchangers and questions regarding crack behavior in pressure vessels. To obtain the maximum potential energy from our limited uranium supplies is is essential to develop the fast breeder reactor. The materials in these reactors are subjected to higher temperatures and neutron fluxes but lower pressures than in the water reactors. The performance required of the fuel elements is more arduous in the breeder than in water reactors. Extensive materials programs are in progress in test reactors and in large test rigs to ensure that materials will be available to meet these conditions.

20326 (DOE/ET/34203—46) Oxygen suppression in boiling water reactors. Phase 2. Annual report 1981, December 2, 1980-December 31, 1981. Burley, E.L. (comp.). (General Electric Co., San Jose, CA (USA). Nuclear Engineering Div.). Jul 1982. Contract AC02-76ET34203. 129p. (NEDC—23856-6). NTIS, PC A07/MF A01. Order Number DE83007939.

A hydrogen addition test will be performed in the Dresden-2 reactor of Commonwealth Edison Company during 1982. Up to 2 ppM hydrogen will be added to and dissolved in the reactor feedwater to reverse the radiolysis reaction in the reactor core and suppress oxgen concentration in the primary coolant. At low oxygen levels the propensity of stressed and sensitized 304 stainless steel toward intergranular stress corrosion cracking is greatly reduced. The test will answer outstanding questions and uncertainties in the areas of water chemistry, equipment design and materials performance. Nine special sample facilities will be prepared in the primary coolant, main stream, feedwater/condensate, and offgas systems. Instrumentation will be available to measure hydrogen, oxygen, conductivity, pH, soluble and insoluble corrosion products, and electrochemical potentials. In addition, an autoclave in which confirming constant extension rate tests can be conducted in reactor water will be provided.

20327 (DOE/ET/34215—31) Fuel-cladding mechanical interaction in PCI-resistant LWR fuel designs during normal operation and power-ramping. Fuel-Performance Improvement Program. Barner, J.O.; Guenther, R.J.; Freshley, M.D. (Pacific Northwest Lab., Richland, WA (USA)). Feb 1983. Contract AC06-76RL01830. 59p. (PNL—4485). NTIS (US Sales Only), PC A04/MF A01. Order Number DE83007205.

The fuel-cladding mechanical interaction behavior of developmental fuel rods irradiated in the Halden Boiling Water Reactor (HBWR) was evaluated based primarily upon rod elongation measurements made during steady-state and power-ramping irradiation. For the nonpressurized reference rods containing solid pellets, there was a relationship between thermal feedback and fuel-cladding mechanical interaction (FCMI) during steady-state irradiation. During power-ramping, the general cladding stress distribution in fuel rods with annular fuel pellets was primarily axial while cladding stresses in rods with sphere-pac fuel was mostly in the hoop direction. The nonpressurized reference design with dished-pellet fuel had significant cladding stresses in both the axial and hoop directions during power-ramping. The work comprises part of the fuel Performance Improvement Program (FPIP) that is sponsored by the US Department of Energy. FPIP participants are Consumers Power Company (CPC), Exxon Nuclear Company (ENC), and the Pacific Northwest Laboratory operated for DOE by Battelle Memorial Institute.

20328 (EPRI-NP—2831) Portable linear accelerator development. Final report. Schonberg, R.G. (Schonberg Radiation Corp., Mountain View, CA (USA)). Jan 1983. 105p. NTIS, PC A06/MF A01. Order Number DE83901573.

The final report on Project RP 822-6 describes the MINAC 3 development from the recognition of need for a lightweight, portable high-energy device to the successful completion and field use of the MINAC. MINAC, which represents a substantial improvement in field radiographic capability and in technology, rapidly transitioned from proof-of-principle (1978 to 1980) to field-proven product (1980 to 1981). As a result, the decision has been made to develop this report as a users guide as well as a historic record of design, development, and testing program. The first section of this report has the following principal objectives: to describe the existing MINAC equipment capabilities and achievable modifications; to provide applications information for prospective users; and to provide technical information on high-energy radiography useful for familiarization and planning. The users guide section is followed by sections which describe the design basis, development, and application history of MINAC through the course of EPRI RP822 research projects 1 to 5, inclusively.

20329 (GRS—39) GARLIC-B. A digital code for real-time calculation of the transient behaviour of nodal and global core and plant parameters of BWR nuclear power plants. Ercan, Y.; Hoeld, A.; Lupas, O. (Gesellschaft fuer Reaktorsicherheit m.b.H. (GRS), Koeln (Germany, F.R.)). Apr 1982. 46p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE83750179.

A program description of the code GARLIC-B is given. The code is based on a nonlinear transient model for BWR nuclear power plants which consist of a 3D-core, a top plenum, steam removal and feed water systems and a downcomer with main coolant recirculation pumps. The core is subdivided into a number of superboxes and flow channels with different coolant mass flow rates. Subcooled boiling within these channels has an important reactivity feed back effect and has to be taken also into account. The code computes the local and global core and plant transient situation as dependent on both the inherent core dynamics and external control actions, i.e., disturbances such as motions of control rod banks, changes of mass flow rates of coolant, feed water and steam outlet. The case of a pressure-controlled reactor operation is also considered.

20330 (NEDO—24583-1) Mark I containment program structural-acceptance criteria: Plan Unique Analysis Application Guide. (General Electric Co., San Jose, CA (USA). Nuclear Engineering Div.). Oct 1979. 43p. General Electric Co., Nuclear Engineering Division, San Jose, CA 95125.

The purpose of the Plant Unique Analysis Application Guide (PUAAG) is to ensure that the structural acceptance criteria are applied consistently by those evaluating each of the specific containments for the utilities. The assignments included herein are considered to be conservative, but are subject to change as a result of additional efforts of the Mark I Containment Program. Revisions of these assignments are subject to NRC review.

20331 (NUREG—0943) Threaded-fastener experience in nuclear power plants. Koo, W.H. (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Reactor Regulation). Jan 1983. 30p. NTIS, PC A03/MF A01 - GPO $4.50. Order Number DE83901544.

This report identifies 44 incidents of threaded-fastener degradation and failure in nuclear power plants from October 1964 to March 1982. It provides an overview of some of the threaded-fastener problems that have occurred since 1964. Safety implications of these incidents are discussed, and short-term regulatory actions and ongoing long-term regulatory actions are described. Information included in this report represents the current NRC staff understanding of each issue.

20332 (NUREG/CP—0034-Vol.1, pp 36-54) **Current challenges in light water reactor physics.** Lee, R.R. (Management Analysis Co., San Diego, CA); Ozer, O.; Cobb, W.R. Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

This paper identifies several areas where improvements and continued development of reactor physics methods and tools will find important application in support of utilities with operating reactors. Increased use of analysis tools will be an important contributor in reaching desired levels of safety and performance for operating reactors. Methods developers must put more emphasis on the end usefulnes of code results to speed acceptance and use of analysis tools within utility organizations.

20333 (NUREG/CP—0034-Vol.1, pp 55-77) **Advances in LWR thermal hydraulics.** Jones, O.C. Jr. (Rensselaer Polytechnic Inst., Troy, NY). Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

Clearly the entire field of LWR thermal hydraulics encompasses the entire fields of multiphase flow and heat transfer - a technical review of which is impossible in this short a space. So rather than attempt this, the author has taken an overview perspective of thermal hydraulic nuclear safety methods as they have developed over the last decade - centered on the development of advanced computational systems and their associated physics. Discussions of both the drift flux model and the two-fluid model are given along with the accompanying formulative process descriptions required. The advances which have played a role in these models are delineated and further advances required identified. 67 references.

20334 (NUREG/CP—0034-Vol.1, pp 209-214) **Interaction of neutronics and thermal-hydraulics in the evaluation of BWR stability.** Park, J.K.; Park, G.C.; Becker, M.; Podowski, M.; Lahey, R.T. Jr. (Rensselaer Polytechnic Inst., Troy, NY). Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

Modeling has been performed for the evaluation of the interaction of neutronics and thermal-hydraulics in the analysis of density-wave oscillations. Application of the models show that the interaction is strong, and that stability margin varies considerably with sophistication of neutronics model.

20335 (NUREG/CP—0034-Vol.1, pp 216-219) **Importance of momentum dynamics in BWR neutronic stability.** Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

The predominant feedback mechanism to the power generation dynamics of a BWR is the coupling between neutron reactivity and coolant density in the core. In modern, large BWR's, two main paths contribute to the coolant density reactivity feedback: (1) a direct power-to-coolant density path wich involves the fuel heat transfer and coolant mass and energy dynamics; and (2) a coolant flow rate-to-coolant density path characterized by the coolant momentum dynamics of the entire flow closed loop formed by the core and recirculation system. In this paper, it is shown how the core's neutronic stability (i.e., reactivity-power) is affected by the coolant's momentum dynamics contribution to the density reactivity feedback.

20336 (NUREG/CP—0034-Vol.1, pp 220-235) **BWR core response to fluctuations in coolant flow and pressure, with implications on noise diagnosis and stability monitoring.** Blomstrand, J.H.; Andersson, S.A. (ASEA-ATOM, Vaesteraas, Sweden). Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

Reactor dynamic tests, utilizing sinuosidal oscillations in pressure and recirculation flow, have been conducted in operating BWRs in Sweden and Finland. Test data recorded, as well as recordings of process noise, have been analyzed in terms of dynamic core properties. The results obtained show good qualitative agreement with model predictions of BWR core dynamics. Model studies can often support interpretation of dynamic information obtained from operating plants. Comparisons between model studies, dynamic tests and process noise may also provide improved understanding of test results and noise patterns; in this way it can be demonstrated that some neutron flux noise is caused by noise in coolant flow and steam flow. From reactor test data nd noise recordings, core stability parameters have been evaluated by a number of methods. These have been found to provide essentially the same results. The cores investigated were found to be very stable under normal operating conditions. In special operating points, outside the normal operating range, higher decay ratios may occur. The experience indicates that for BWR cores, operated at decay ratios above quarter damping, the stability parameters may be identified from the oscillatory behavior of the autocorrelation in the time domain of the neutron flux noise.

20337 (NUREG/CP—0034-Vol.1, pp 236-253) **Neutronics analysis of BWR partial scrams with boron injection.** Chexal, B.; Layman, W.; Power, J.; Pickering, R.; Grow, R.; Simonson, C. Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

This article summarizes a reactor neutronics analysis for a transient where some number of control rods do not insert. The analysis is applicable to a typical BWR-4 plant. It focuses on the power distribution in the core and on reactor criticality both with and without standby liquid boron injection. The work is directed towards providing better guidance to the operator regarding boron injection during partial control rod insertion incidents in boiling water reactors.

20338 (NUREG/CP—0034-Vol.1, pp 271-285) **Recent BWR fuel management reactor physics advances.** Crowther, R.L.; Congdon, S.P.; Crawford, B.W.; Kang, C.M.; Martin, C.L.; Reese, A.P.; Savoia, P.J.; Specker, S.R.; Welchly, R. Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

Improvements in BWR fuel management have been under development to reduce uranium and separative work (SWU) requirements and reduce fuel cycle costs, while also maintaining maximal capacity factors and high fuel reliability. Improved reactor physics methods are playing an increasingly important role in making such advances feasible. The improved design, process computer and analysis methods both increase knowledge of the thermal margins which are available to implement fuel management advance, and improve the capability to reliably and efficiently analyze and design for fuel management advances. Gamma scan measurements of the power distributions of advanced fuel assembly and advanced reactor core designs, and improved in-core instruments also are important contributors to improving 3-d predictive methods and to increasing thermal margins. This paper is an overview of the recent advances in BWR reactor physics fuel management methods, coupled with fuel management and core design advances. The reactor physics measurements which are required to confirm the predictions of performance fo fuel management advances also are summarized.

20339 (NUREG/CP—0034-Vol.1, pp 348-363) **Application of nodal methods to light water reactors.** Finck, P.J.; Hoxie, C.L.; Khalil, H.S.; Parsons, D.K.; Henry, A.F. (Massachusetts Inst. of Tech., Cambridge). Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

Systematic methods for determining node-homogenized group parameters and reconstructing local fuel pin powers using only fine-mesh calculations for isolated fuel assemblies - in some cases extended assemblies or color sets - along with two-group nodal calculations for determining reactor eigenvalue and flux distribution are described. Numerical tests for small two dimensional benchmark problems yield maximum errors in local pin powers at beginning of life of ~ 5% for both PWR's and BWR's.

20340 (NUREG/CP—0034-Vol.1, pp 391-405) **Lattice homogenization theory for coarse mesh diffusion analysis.** Chiang, R.T. (General Electric Co., San Jose, CA). Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

A lattice homogenization theory is developed for coarse mesh diffusion analysis in a large heterogeneous system composed of diffusion analysis in a large heterogeneous system composed of two-dimensional, exactly periodic or near-periodic fuel bundles. The development systematically leads to the separation of the solution to the heterogeneous reactor diffusion equation into a local shape function (the fundamental unit-bundle diffusion theory eigenfunction) and a global shape function (the fundamental solution to the bundle-homogenized reactor diffusion equation). The eigenvalue of the homogenized reactor diffusion equation is shown to preserve the eigenvalue of the heterogeneous reactor diffusion equation. The bilinear-weighted homogenized diffusion coefficient and cross-sections are derived in terms of forward and adjoint solutions to the unit-bundle diffusion equation. Discontinuous interface conditions are used in determination of the solution to the homogenized diffusion equation for large systems composed of near-periodic bundles. Numerical results are given for several fictitious light-water slab reactors composed of exactly periodic or near-periodic fuel bundles.

20341 (NUREG/CP—0034-Vol.1, pp 468-478) **Investigation of the axial void propagation velocity profile in BWR fuel bundles.** Kosaly, G. (Univ. of Washington, Seattle); Fahley, J.M.; Behringer, K.; Crowe, R.D. Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

The paper describes the method of measuring axial void propagation velocity in the core of an operating BWR. Experimental data obtained from the noise signals of LPRM and TIP detectors are compared to calculated steam velocity and kinematic wave velocity profiles.

20342 (NUREG/CP—0034-Vol.1, pp 487-497) **Separate effects tests in support of BWR thermal/hydraulic monitoring.** Albrecht, R.W.; Crowe, R.D.; Dailey, D.J.; Khan, H.J.; Kotani, K.; Swoope, S.C. (Univ. of Washington, Seattle). Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

Miniature fission chambers, mounted on a flow section, were used in a small research reactor to characterize two-phase flow. A stochastic description of the structure, dynamics, and propagation is developed. The property of propagation, as measured by neutronic noise analysis, is addressed. The drift flux model is compared to experimental results.

20343 (NUREG/CP—0036, pp 107-120) **Stress corrosion cracking in boiling water reactor (BWR) piping.** Eason, E.D. (Failure Analysis Associates, Palo Alto, CA). Nov 1982. NTIS, PC A13/MF A01 - GPO.

From Workshop on nuclear power plant aging; Bethesda, MD, USA (4 Aug 1982).

Results are presented from recent Electric Power Research Institute projects on stress corrosion cracking in 304 stainless steel Boiling Water Reactor (BWR) piping. Repair rates have been calculated for stress corrosion cracking incidents grouped by piping systems, BWR generations, and individual plants, using non-parametric order statistics techniques. From these results, the original data groups are lumped into statistically-justified populations for further analysis. The rates for different plants or BWR generations are not found to be significantly different, but the rates for different piping systems are. Consequently, the number of repairs per plant per year is calculated separately for several piping systems with all plants lumped together. The repair rate is increasing with plant age in most systems, indicating a time-dependent wear-out phenomenon. The cost-effectiveness of countermeasures such as enhanced inspection, startup deaeration, material replacement, etc., is analyzed with a breakeven approach.

20344 (NUREG/CR—2703) **Investigation of special-purpose processors for real-time synthetic-aperture-focusing techniques for nondestructive evaluation of nuclear-reactor vessels and piping components.** Ganapathy, S.; Schmult, B.; Wu, W.S.; Hamano, N.; Bristor, D. (Michigan Univ., Ann Arbor (USA). Dept. of Electrical and Computer Engineering). Jan 1983. 91p. NTIS, PC A05/MF A01 - GPO $5.50. Order Number DE83901509.

Progress in the development of a special purpose system for use in a real-time in-service inspection system for reactor vessels and piping components is described in this report. An analysis of the synthetic aperture processing algorithm is presented and new methods of speedup are described. A number of special purpose processor architectures are presented and two of the more promising ones are described in detail and are compared and evaluated. Proposed specifications for an initial field inspection system are presented. A brief description of the capabilities of a laboratory prototype processor (to be fabricated) is given.

20345 (NUREG/CR—2805-Vol.2) **LWR Pressure-Vessel Surveillance Dosimetry-Improvement Program. Quarterly progress report, April 1982-June 1982.** Guthrie, G.L.; McElroy, W.N. (Hanford Engineering Development Lab., Richland, WA (USA)). Jan 1983. Contract AC06-76FF02170. 53p. (HEDL-TME—82-19). NTIS, PC A04/MF A01 - GPO $4.75. Order Number DE83007395.

The Light Water Reactor Pressure Vessel Surveillance Dosimetry Improvement Program (LWR-PV-SDIP) has been established by NRC to improve, test, verify, and standardize the physics-dosimetry-metallurgy, damage correlation, and the associated reactor analysis methods, procedures and data that are used to predict the integrated effect of neutron exposure to LWR pressure vessels and their support structures. Research activities by the Hanford Engineering Development Laboratory and the Oak Ridge National Laboratory are reviewed.

20346 (NUREG/CR—2805-Vol.3) **LWR Pressure-Vessel Surveillance Dosimetry Improvement Program. 1982 annual report, October 1, 1981- September 30, 1982.** McElroy, W.N.; Kam, F.B.K.; Grundl, J.A.; McGarry, E.D.; Fabry, A. (Hanford Engineering Development Lab., Richland, WA (USA)). Jan 1983. Contract AC06-76FF02170. 166p. (HEDL-TME—82-20). NTIS, PC A08/MF A01 - GPO $6.50. Order Number DE83007339.

This report describes progress made in the Light Water Reactor Pressure Vessel Surveillance Dosimetry Improvement Program (LWR-PV-SDIP) during FY 1982. The primary concern of this program is to improve, test, verify and standardize the physics-dosimetry-metallurgy and the associated reactor and damage analysis procedures and data used for predicting the integrated effects of neutron exposure to LWR pressure vessels and support structures. These procedures and data are being recommended in a new and updated set of ASTM standards being prepared, tested, and verified by program participants. These standards together with parts of the US Code of Federal Regulations and ASME codes are needed and used for the assessment and control of the condition of LWR pressure vessels and support structures during the 30 to 50 year lifetime of a nuclear power plant.

20347 (NUREG/CR—3108) **Extended-burnup calculations for operating-reactor reload reviews.** Wilson, W.B.; England, T.R.; LaBauve, R.J. (Los Alamos National Lab., NM (USA)). Feb 1983. Contract W-7405-ENG-36. 95p. (LA—9563-MS). NTIS, PC A05/MF A01 - GPO $5.50. Order Number DE83007381.

The core inventories of radionuclides presently used in evaluations of hypothetical reactor accidents are based on calculations intended to be conservative for common fuel enrichments and discharge exposures of about 25,000 megawatt-days per metric ton of uranium (MWd/tU). The objective of this work has been to provide a set of radionuclide inventories that bounds the inventories expected (without anticipated variations in fuel management) for various enrichments, reactor types, and burnup.

20348 (SAND—82-7056) **Peer-review study of the draft handbook for human-reliability analysis with emphasis on nuclear-power-plant applications, NUREG/CR-1278.** Brune, R.L.; Weinstein, M.; Fitzwater, M.E. (Human Performance Technologies, Inc., Thousand Oaks, CA (USA)). Jan 1983. Contract AC04-76DP00789. 231p. NTIS, PC A11/MF A01. Order Number DE83007377.

This report describes a peer review of the draft Handbook for Human Reliability Analysis with Emphasis on Nuclear Power Plant Applications, NUREG/CR-1278. The purpose of the study was to determine to what extent peers agree with the human behavior models and estimates of human error probabilities (HEPs) contained in the Handbook. Twenty-nine human factors experts participated in the study. Twenty of the participants were Americans; nine were from other countries. The peers performed human reliability analyses of a variety of human performance scenarios describing operator activities in nuclear power plant settings. They also answered questionnaires pertaining to the contents and application of the Handbook. An analysis of peer solutions to the human reliability analysis problems and peer responses to the questionnaire was performed. Recommendations regarding the format and contents of the Handbook were developed from the study findings.

20349 RELAP5 constitutive relations modeling. Ransom, V.H.; Chow, H.; Kiser, D.M.; Lin, J.C. (EG & G Idaho Inc., P.O. Box 1625, Idaho Falls, ID 83415). *Transactions of the American Nuclear Society;* **41**: 671-672(Jun 1982). (CONF-820609—).

From American Nuclear Society annual meeting; Los Angeles, CA, USA (6 Jun 1982).

20350 (ANL/NESC—331R) M0219;FLOT1; PWR flow transient analysis. Fuls, G.M. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048331.

The mathematical model, upon which the program is based, is limited to four loops with a maximum of three pumps per loop in parallel.

FLOT1 will predict the steady-state flow and the flow transient due to the subsequent loss of power to all pumps and terminate the transient at a specified time or it will predict the flow transient in which only some of the pumps are lost. This latter transient may be terminated by a maximum transient time or by check valve closures in all loops in which pumping power is lost. In the latter event, the program will predict the subsequent steady-state flow distribution.CDC6600; FORTRAN IV; SCOPE 2.0; The program is designed for card input with both printed and plotted output. The number of core locations required is 55,000 octal..

20351 (ANL/NESC—876) K-TIF; two-fluid PWR downcomer fluid dynamics. Amsden, A.A.; Harlow, F.H. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048876.

The material speeds are assumed to be much smaller than the sound speed at each point so that the microscopic material density for each phase is independent of position.

K-TIF was developed for the numerical solution of the time-varying dynamics of steam and water in a pressurized water reactor (PWR) downcomer. The model is designed to describe the complicated countercurrent flow under start up, steady state and transient flow conditions covering as wide a set of experimental configurations as possible.CDC7600; FORTRAN (LRLTRAN and CHAT compiler); LTSS, SCOPE; 31,000 (octal) words of small core memory (SCM) and 28,000 (octal) words of large core memory (LCM).

20352 (CONF-830318—1) System for automated diagnosis of reactor-coolant pumps. Gabler, H.C.; Stevens, D.M.; Morris, D.J.; Glass, S.W.; Sommerfield, G.A.; Harrison, D. (Toledo Edison Co., OH (USA); USDOE, Washington, DC). 1983. Contract AC02-79ET34019. 3p. NTIS (US Sales Only). Order Number DE83006906.

From 5. power plant dynamics control and testing symposium; Knoxville, TN, USA (21 Mar 1983).

The Reactor-Coolant Pump Monitoring and Diagnostic System will combine seal and rotating machinery analyses to provide continuous, comprehensive, and unattended watch over the four reactor coolant pumps at Davis-Besse. Initial demonstration of the system will provide machine protection, and investigate the opportunity for incipient failure detection. The longer range benefit will be a better understanding of the mechanisms behind seal deterioration which can be drawn upon to reduce or eliminate future seal failures.

20353 (DOE/ET/34015—3) Steam-Generator Dilute-Chemical-Cleaning Program: steam-generator chemical-cleaning project. Annual report for 1981. Simon, G.P.; Smoot, D.E.; Schneidmiller, D. (UNC Nuclear Industries, Inc., Richland, WA (USA)). Dec 1982. Contract AC02-79ET34015. 61p. NTIS, PC A04/MF A01. Order Number DE83008261.

The dilute chemical cleaning program evaluates the feasibility of using low-concentration, regenerable solvents to maintain the secondary side of PWR steam generators in a clean condition. The experimental work carried out during this report period identified an acceptable dilute cleaning solvent formulated with 0.1 wt % each of citric acid, gluconic acid and ascorbic acid. Corrosion rates for the major steam generator construction materials can be limited to <1 mil/day when cinnamonitrile is included in the formulation at a concentration of 0.3 wt % or greater. Regeneration of partially depleted solvent was demonstrated in a recirculating system using strong acid cation exchangers in the H^+ or NH_4^+ form. Solvent pH in the range of 3.4 to 3.8 was maintained during the cleaning operations with chemical additions. It was also demonstrated that mixed-bed resins in the H-OH form are capable of removing residual chemicals after cleaning and restoring coolant quality to a conductivity level of less than 10 μmhos.

20354 (DOE/ET/34019—2) Development of a reactor-coolant-pump monitoring and diagnostic system. Semi-annual progress report, December 1981-May 1982. Morris, D.J.; Gabler, H.C. (Babcock and Wilcox Co., Lynchburg, VA (USA)). Oct 1982. Contract AC02-79ET34019. 81p. (BAW—1746). NTIS, PC A05/MF A01. Order Number DE83007923.

Reactor coolant (RC) pump seal failures have resulted in excessive leakage of primary coolant into reactor containment buildings. In some cases, high levels of airborne activity and surface contamination following these failures have necessitated extensive cleanup efforts and personnel radiation exposure. Unpredictable pump seal performance has also caused forced outages and frequent maintenance. The quality of operating data has been insufficient to allow proper evaluation of theoretical RC pump seal failure mechanisms. The RC pump monitoring and diagnostic system being developed and installed at Toledo Edison's Davis-Besse Nuclear Power Station will examine the relationship between seal failures and three other variables. This report describes system software and hardware development, testing, and installation work performed during the period of December 1981 through May 1982. Also described herein is a parallel effort being conducted by a B & W/Byron Jackson/Utility group to improve pump seal performance.

20355 (EGG-M—19582) Microcomputer simulation of nonlinear two-phase pressurizer dynamics. Tylee, J.L. (EG and G Idaho, Inc., Idaho Falls (USA)). 1983. Contract AC07-76ID01570. 6p. (CONF-830126—1). NTIS, PC A02/MF A01. Order Number DE83006524.

From Conference on modeling and simulation on microcomputers; San Diego, CA, USA (27 Jan 1983).

The dynamics of a pressurized water reactor (PWR) pressurizer are simulated in BASIC using a Commodore PET 2100 Series microcomputer. The simulation, which operates at one-half real-time, models the two-phase interactions within the pressurizer and uses an iterative technique to compute pressure. The simulation performance is evaluated with data from a small test-reactor plant.

20356 (EPRI-NP—2791) Proceedings: support-structure corrosion in steam generators. Shoemaker, C.E.; Jones, D.A. (eds.). (Electric Power Research Inst., Palo Alto, CA (USA); Nevada Univ., Reno (USA). Mackay School of Mines). Jan 1983. 407p. (CONF-8205156—). NTIS, PC A18/MF A01. Order Number DE83901574.

From EPRI workshop on support-structure corrosion in steam generators; Boston, MA, USA (18 May 1982).

Objectives of the workshop were to define limits of water chemistry impurities for various support materials exposed to secondary water for a 40-year lifetime; to review factors affecting corrosion, hideout and return of salts in steam generator crevices; and to discuss additional candidate alloys and tests that would further define and optimize support design to minimize corrosion. The subject areas included: crevice corrosion rates of alloy steels compared to carbon steel; results from examination of support plate segments removed from steam generators; and review of models for corrosion and salt hideout in crevices. The data are intended to provide a basis for utilities to determine their particular design and material needs for steam generator support structures.

20357 (EPRI-NP—2791, pp 1.1-1.36) **Recent Westinghouse experience with tube support plate materials corrosion studies.** Wolfe, C.R. (Westinghouse Electric Corp., Pittsburgh, PA). Jan 1983. NTIS, PC A18/MF A01.

From EPRI workshop on support-structure corrosion in steam generators; Boston, MA, USA (18 May 1982).

The viewgraphs that are presented summarize some of the more significant results of recent tube support corrosion programs at Westinghouse.

20358 (EPRI-NP—2791, pp 2.1-2.30) **Corrosion of support materials.** Krupowicz, J.J. (Combustion Engineering, Inc., Windsor, CT). Jan 1983. NTIS, PC A18/MF A01.

From EPRI workshop on support-structure corrosion in steam generators; Boston, MA, USA (18 May 1982).

Information is presented concerning the corrosion of steam generator tube support materials of 1010 carbon steel, stainless steel-405, stainless steel-409, stainless steel-430, stainless steel-347, and SCR-3.

20359 (EPRI-NP—2791, pp 3.1-3.26) **Preliminary corrosion results on alternative support materials from two model steam generator tests.** Krupowicz, J.J. (Combustion Engineering, Inc., Windsor, CT). Jan 1983. NTIS, PC A18/MF A01.

From EPRI workshop on support-structure corrosion in steam generators; Boston, MA, USA (18 May 1982).

Results of corrosion tests on steam generator tube support materials are presented for stainless steel-347, stainless steel-405, stainless steel-409, SCR-3, and Inconel 600.

20360 (EPRI-NP—2791, pp 4.1-4.29) **Alloy steel corrosion kinetics and oxide morphologies in acid chloride environments.** Forrest, J.E.; Broomfield, J.P. (Central Electricity Research Labs., Leatherhead, England). Jan 1983. NTIS, PC A18/MF A01.

From EPRI workshop on support-structure corrosion in steam generators; Boston, MA, USA (18 May 1982).

The denting of PWR primary water tubes as a result of corrosive attack of the mild steel support plates has led to extensive research into the mechanism of corrosion and a search for palliatives to ease the problem. In the current design of steam generators the mild steel drilled hole tube support plate has been replaced by one of quatrefoil or trifoil shape made of ferritic stainless steel (12%Cr) to ensure that the plates are less vulnerable to attack in the event of adverse boiler water chemistry. The oxide volume is again approximately twice that of the metal consumed but the corrosion mechanism is different from that of the mild steel in that a duplex oxide is formed consisting of an inner chromium rich $(FeCr)_3O_4$ layer surmounted by an outer Fe_3O_4 layer of similar thickness. This study was initiated to investigate the mechanisms of oxide growth and the transition between protective and rapid linear oxidation in order to validate the use of chromium steels for resistance to acid chloride attack and to establish a confidence margin in terms of chromium content and environment.

20361 (EPRI-NP—2791, pp 5.1-5.28) **Measuring corrosion rates in crevices with a computer-controlled flow loop.** McKubre, M.C.H. (Stanford Research Inst., Menlo Park, CA). Jan 1983. NTIS, PC A18/MF A01.

From EPRI workshop on support-structure corrosion in steam generators; Boston, MA, USA (18 May 1982).

The corrosion rate produced by galvanic coupling within a crevice is studied using a computer controlled flow loop. The materials studied include: 1018 carbon steel, stainless steel-405, stainless steel-409, stainless steel-347, and Incoloy 800. A description of the test facilities and electronic equipment is included.

20362 (EPRI-NP—2791, pp 6.1-6.29) **Examinations of support plate samples from steam generators.** Pement, F.W. (Westinghouse Electric Corp., Pittsburgh, PA). Jan 1983. NTIS, PC A18/MF A01.

From EPRI workshop on support-structure corrosion in steam generators; Boston, MA, USA (18 May 1982).

Intersections between Inconel tubing and carbon steel tube support plates were removed from three plants which were undergoing active denting. Each plant had started with phosphate based secondary water treatment, had changed to all-volatile treatment and had experienced some condenser in-leakage of chloride containing cooling waters. All intersection samples contained annuli which were filled with deposits of secondary side additives, contaminants, and corrosion products. Microprobe area scans of the annular space showed zones or bands containing Fe, and in most cases, Ni, Cu, P, Ca, S, Si, Mg, and Zn within the annulus filling material. In some cases, Ni was concentrated near either the tube or the support plate interfaces or both. Chloride was an impurity throughout the material and was also found at the plate-to-annulus interface, sometimes in high relative concentrations. The microanalyses are consistent with a chloride-aided corrosion of the carbon steel support plate material.

20363 (EPRI-NP—2791, pp 7.1-7.23) **Summary of results, Millstone 2 tube support plate examination.** Fackelmann, J.M. (Northeast Utilities Co., Hartford, CT). Jan 1983. NTIS, PC A18/MF A01.

From EPRI workshop on support-structure corrosion in steam generators; Boston, MA, USA (18 May 1982).

Denting at Millstone 2 (MP-2) was caused by exposure to fault chemistry conditions during the first cycle. Comprehensive macro and micro analyses were performed on a sample removed from steam generator (SG) No. 2 to define causative factors. These data generally support an acid chloride mechanism, with a significant copper role. Reduction of chloride level to less than detectable (60 ppB) after the first cycle was not sufficient to stop the progression of denting, although a great improvement was noted. It is evident that complex synergistic factors are operative in the field, as typified by Millstone 2. This work defines some of the complex corrosion products that played a role in producing the local faulted chemistry condition, leading to denting.

20364 (EPRI-NP—2791, pp 8.1-8.19) **Sampling and analysis of lower steam generator support plate - Indian Point 2.** Rothstein, S. (Consolidated Edison Co. of New York, NY). Jan 1983. NTIS, PC A18/MF A01.

From EPRI workshop on support-structure corrosion in steam generators; Boston, MA, USA (18 May 1982).

In 1978, Con Edison developed what appeared to be an acceptable chemical cleaning procedure. However, before proceeding with the actual chemical cleaning of the Indian Point Unit 2 steam generators, it was necessary to qualify the procedure on a sample tube/support plate crevice taken from the steam generator. It was decided that a sample would be removed consisting of 22 tubes comprised of 11 tubes in the first row (which had never been serviced) and 11 tubes in the second row, all adjacent to a flow slot. Procedures for removing the samples are described. Examination of the corroded mild steel support plate is also described.

20365 (EPRI-NP—2791, pp 8.23-8.37) **Examination of a corroded mild steel support plate.** Bell, P.S.; Forrest, J.E.; Libaert, D.F.; Mann, G.M.W. (Central Electricity Research Labs., Leatherhead, England). Jan 1983. NTIS, PC A18/MF A01.

From EPRI workshop on support-structure corrosion in steam generators; Boston, MA, USA (18 May 1982).

The following discussion describes a metallographic examination of a portion of the corroded support plate section removed from Steam Generator No. 23 at Indian Point 2. Rapid corrosion of the mild steel in the annular crevices between tubes and support plate holes had caused denting. The denting caused the narrow ligaments between the flow holes and support holes to fracture. As a result, the support plate fragmented when removed from the steam generator. One of the fragments was used for the examination.

20366 (EPRI-NP—2791, pp 9.1-9.44) **Characterization of model boiler specimens.** Gibbon, D.L.; Varsanik, R.G. (Calgon Corp., Pittsburgh, PA). Jan 1983. NTIS, PC A18/MF A01.

From EPRI workshop on support-structure corrosion in steam generators; Boston, MA, USA (18 May 1982).

This paper describes the general results of an investigation of three crevice corrosion samples provided by Westinghouse from the S112-1 Model Boiler Program. These samples had all been formed under essentially the same initial chemical conditions, but two had been treated with inhibitors at the end of the experimental runs. The first received no neutralization during the model runs, the second was treated with $Ca(OH)_2$ and the third was treated with boric acid. The samples were prepared for examination in several different ways. The samples were characteristic of dented intersections and had the general conformation of a thin-walled inner Inconel cylinder within a thick-walled carbon steel cylinder. An original 12-mil inter-cylinder gap had been packed with powdered magnetite. This magnetite had been augmented by further growth of magnetite during the model runs, making the oxide layer considerably thicker than the original 12-mils in some areas of the samples. The cylinders were sectioned and polished perpendicular to their long axes and the resulting surfaces examined.

20367 (EPRI-NP—2791, pp 10.1-10.49) **Effect of oxygen and oxidizing ions on denting corrosion.** Mann, G.M.W. (Central Electricity Research Labs., Leatherhead, England). Jan 1983. NTIS, PC A18/MF A01.

From EPRI workshop on support-structure corrosion in steam generators; Boston, MA, USA (18 May 1982).

Information is presented concerning solute concentration in a porous layer; solute concentration in a packed crevice; corrosion of a packed carbon steel crevice in $NaCl-O_2$ solutions; and effect of copper on corrosion in $NaCl-O_2$ solutions.

20368 (EPRI-NP—2791, pp 11.1-11.37) **Modeling of salt concentrations in crevices.** Lindsay, W.T. Jr. (Westinghouse Electric Corp., Pittsburgh, PA). Jan 1983. NTIS, PC A18/MF A01.

From EPRI workshop on support-structure corrosion in steam generators; Boston, MA, USA (18 May 1982).

Test facilities and test results are described for the corrosive effects of NaCl solutions on steam generator materials of Inconel 600 and carbon steels.

20369 (EPRI-NP—2791, pp 12.1-12.34) **Impedance studies of the growth of porous magnetite films on carbon steel in high temperature aqueous systems.** Park, J.R.; Macdonald, D.D. (Ohio State Univ., Columbus). Jan 1983. NTIS, PC A18/MF A01.

From EPRI workshop on support-structure corrosion in steam generators; Boston, MA, USA (18 May 1982).

An AC impedance study is described for the corrosion of carbon steel in high temperature (200 and 250°C) chloride-containing (0.998m NaCl + 0.001m $FeCl_2 . 4H_2O$) solutions. The goals of this study were to develop a better understanding of the mechanism of corrosion and film growth, and to derive an electrical model for the interface which subsequently might be used to predict the properties of films formed in crevices in operating PWR steam generators. The objectives are being achieved by the use of wide frequency band-width AC impedance techniques to determine the interfacial transfer function as the corrosion processes evolve with time.

20370 **(EPRI-NP—2806) Monitoring techniques for pH, hydrogen, and redox potential in nuclear-reactor circuits.** MacDonald, D.D.; Scott, A.C.; Wentrcek, P.; McKubre, M.C.H. (SRI International, Menlo Park, CA (USA)). Jan 1983. 84p. NTIS, PC A05/MF A01. Order Number DE83901534.

The development and testing of monitoring instruments to measure the level of corrosivity of high-temperature water in steam power systems are discussed. Specifically, a pressure-balanced, external reference electrode for measuring pH and redox potential is addressed. In addition, the development and demonstration of a platinum redox potential probe and a palladium-dissolved hydrogen gas probe are discussed as well as the development and testing of a pH probe based on palladium.

20371 **(EPRI-NP—2841) Results of EDF/Framatome underclad crack-detection methods. Final report.** Sermadiras, P.; Launay, J.P. (Electricite de France, 93 - Saint-Denis. Groupe des Labs.; Framatome, 92 - Paris La Defense (France)). Jan 1983. 107p. NTIS, PC A06/MF A01. Order Number DE83901446.

In 1978 underclad defects were deteced, in FRANCE, in the base metal of reactor vessel nozzles and steam generator tube sheets. EDF and FRAMATOME then developed examination methods aimed at detecting these cracks in shop and on site: manual and automatic ultrasonic examination of vessel nozzles (70° inclined longitudinal waves), and automatic Eddy Current examination of steam generator tube sheets. Studies are still going on to improve indication characterization and determine crack height.

20372 **(HEDL-TC—2274) Fabrication data package for HEDL-RI dosimetry in the Maine Yankee Replacement Surveillance Capsule 263 and cavity positions.** Kellogg, L.S.; Ulseth, J.A.; Lippincott, E.P.; Oliver, B.; Farrar, H. (Hanford Engineering Development Lab., Richland, WA (USA)). Dec 1982. Contract AC06-76FF02170. 109p. NTIS, PC A06/MF A01. Order Number DE83008400.

This document provides a complete description of dosimetry fabricated for the Maine Yankee Surveillance Capsule Number 263 and three azimuthal positions in the reactor cavity. Surveillance Capsule 263 was originally scheduled for insertion in October 1982, but will be held in reserve for future use, pending establishment of an equilibrium low leakage core burnup distribution. The cavity dosimetry is scheduled for insertion in November 1982.

20373 (NUREG/CP—0034-Vol.1, pp 286-296) **Interaction between core analysis methodology and nuclear design: some PWR examples.** Rothleder, B.M. (Science Applications, Inc., McLean, VA); Eich, W.J. Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

The interaction between core analysis methodology and nuclear design is exemplified by PSEUDAX, a major improvement related to the Advanced Recycle methodology program (ARMP) computer code system, still undergoing development by the Electric Power Research Institute. The mechanism of this interaction is explored by relating several specific nulcear design changes to the demands placed by these changes on the ARMP system, and by examining the meeting of these demands, first within the standard ARMP methodology and then through augmentation of the standard methodology by development of PSEUDAX.

20374 (NUREG/CP—0034-Vol.1, pp 297-314) **Application of static and time-dependent generalized perturbation theory methods in LWR physics analyses.** White, J.R.; Williams, M.L. (Oak Ridge National Lab., TN). Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00. Contract W-7405-ENG-26.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

This paper examines te validity and potential usefulness of generalized perturbation theory (GPT) as a tool in the physics analysis of light water reactor (LWR) systems. Special emphasis is placed on the ability of the time-dependent methodology to quantitatively relate the end-of-cycle state of a realistic PWR model to variations made at earlier times in the cycle. Comparisons between static and time-dependent GPT results are made and the physics implications of the observed differences are briefly discussed. The paper also outlines several generic advantages and disadvantages of perturbation methods,and it is concluded that GPT method represent an attractive alternative to standard brute-force methods for many types of LWR physics analyses. however, there are some types of problems frequently encountered in LWR core calculations for which first-order perturbation theory breaks down, and these are also examined and briefly discussed.

20375 (NUREG/CP—0034-Vol.1, pp 315-332) **Development and validation of core physics methods for in-core fuel management.** Aragones, J.M. (Universidad Politecnica, Madrid, Spain); Ahnert, C.; Gomez-Santamaria, J.; Olavarria, I.R. Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

Under the objective of developing and experiencing a proper core physics calculating capability to perform the in-core fuel management, to evaluate the nuclear core design and startup tests and to support the reactor operation and licensing, a system of neutronic codes and related methods and procedures, has been developed and validated against both the nuclear design results, provided by the reactor vendor and the startup and operating measurements, from a PWR core of 900 MWe started-up in Spain in 1981.

20376 (NUREG/CP—0034-Vol.1, pp 333-347) **Uranium recycle in PWRs.** Darrouzet,M. (CEN/Cadarache, France); Simon, A.; Soldevila, M. Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

Uranium recycling allows a better use of the natural resources, but the accumulation of some uranium isotopes (232, 234 and 236) in the spent fuel results in neutronic and radioprotection problems: the parasitic absorption of U 234 and U 236 which requires an over enrichment of the fuel; and the activity of the spent fuel to be reenriched due to some daughters of U 232. Moreover, a choice has to be made between two reenrichment strategies: must reprocessed uranium be introduced into the natural uranium cycle, or in a specialized one. The first part of this paper is devoted to a brief analysis of these problems. In the second part, the neutronic characteristics are presented of a PWR core loaded with fuel made from reprocessed uranium. These results are compared to those related to a standard fuel loaded core; they were obtained by means of cell and core calculations. In the discussion, the importance of some phenomena (self shielding, spectral variation) is pointed out.

20377 (NUREG/CP—0034-Vol.1, pp 424-439) **Review of proposed instrumentation for measurement of inadequate core cooling in LWRs.** Bailey, P.G.; Merilo, M. (Electric Power Research Inst., Palo Alto, CA). Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

Recent events in the nuclear industry have resulted in an increase of attention and emphasis toward the development and use of instrumentation systems to measure the approach to inadequate core cooling conditions in light water reactors. A large number of instrumentation concepts and systems have been proposed for this purpose. Of the systems which have actually been constructed, few have been thoroughly tested. The various concepts and systems are reviewed and their status, capabilities, and limitations briefly discussed. Two instrumentation systems based upon the use of differential pressure measurements and heated junction thermocouples have been developed and partially tested by Westinghouse and Combustion Engineering, respectively. As the NRC has recently recommended the generic approval of these two systems, many utilities are expected to pursue the use of thee systems to satisfy NRC requirements.

20378 (NUREG/CP—0034-Vol.1, pp 479-486) **Use of conductance probe method to measure two phase flow pattens.** Huahun, G.; Chuanjing, T. (Xi'an Jiaotong Univ., China). Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

A set of double conductance probes is used to measure the flow patterns in two phase horizontal straight and helical flow. Both the visual and conductance probe methods agree moderately well.

20379 (NUREG/CP—0034-Vol.1, pp 498-505) **Accuracy of power peaking monitoring using fixed incore detector systems.** Rombough, C.T.; Guthrie, B.A.; Clark, R.E.; Warren, H.D. Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

A definitive sensitivity study has quantified the error associated with using a fixed incore detector system to monitor the peak pwoer ina nuclear reactor core. Results of this study show that by using a recently developed curve fit technique, the error is less than 2% (for a peak of 1.5 RPD) for 5 or more fixed detectors in the fuel assembly. This technique incorporates some innovative improvements which minimize the curve-fit error. Grids are realistically simulated in the fitted curves and extrapolation points are determined as a function of the measured signal at each end. With these improvements, afixed system can produce an accurate representation of the axial flux shape within the assembly on a continuous basis.

20380 (NUREG/CP—0036, pp 176-189) **Methods for predicting strain in dented steam generator tubes from profilometry data.** Derbalian, G.; Johnston, P.R. (Failure Analysis Associates, Palo Alto, CA). Nov 1982. NTIS, PC A13/MF A01 - GPO.

From Workshop on nuclear power plant aging; Bethesda, MD, USA (4 Aug 1982).

Steam generator tubes become dented due to the growth of oxide between the tube and its support structure. When the denting becomes severe, the tube must be plugged to prevent the possibility of primary water leakage. A number of factors, including tube strain, determine the optimal time for plugging. Tube strains cannot be measured directly, and thus, tube strain must be predicted from profilometry measurements. The prediction of tube strain requires two steps: definition of tube shape from radial displacements measured by a probe, and determination of strain from the defined tube shape. Procedures for both of these steps are presented and compared. Recommendations for the use of these methods and future probe developments are given.

20381 (NUREG/CP—0036, pp 245-255) **Statistical performance analysis of salt water cooled pressurized water reactors.** Feldman, B. (Nuclear Technology Maintainability Research, Somerville, MA). Nov 1982. NTIS, PC A13/MF A01 - GPO.

From Workshop on nuclear power plant aging; Bethesda, MD, USA (4 Aug 1982).

Pressurized water reactors (PWRs) using salt or brackish cooling water are found to have significant long-term decreases in capacity factors and increases in forced outage rates (FORs) due to equipment failures and maintenance needs. Larger units have significantly lower capacity factors and higher FORs. The significance and magnitude of this correlation increases with unit age. Post-Three Mile Island effects are controlled for.

20382 **(NUREG/CR—2993) Examination of failed studs from No. 2 steam generator at the Maine Yankee Nuclear Power Station.** Czajkowski, C. (Brookhaven National Lab., Upton, NY (USA)). Feb 1983. Contract AC02-76CH00016. 32p. (BNL-NUREG—51594). NTIS, PC A03/MF A01 - GPO $3.75. Order Number DE83008254.

Three studs removed from service on the primary manway cover from steam generator No. 2 of the Maine Yankee station were sent to Brookhaven National Laboratory (BNL) for examination. The examination consisted of visual/dye penetrant examination, optical metallography and Scanning Electron Microscopy/Energy Dispersive Spectroscopy (SEM/EDS) evaluation. One bolt was through cracked and its fracture face was generally transgranular in nature with numerous secondary intergranular cracks. The report concludes that the environmenally assisted cracking of the stud was due to the interaction of the various lubricants used with steam leaks associated with this manway cover.

20383 **(TES/TR—4599-1) Continued investigation of the failure of Midland Unit 1 RPV anchor studs: data report.** (Teledyne Engineering Services, Waltham, MA (USA)). 11 Feb 1981. 61p. Teledyne Engineering Services, 303 Bear Hill Road, Waltham, MA 02154.

Teledyne Engineering Services (TES), under contract to Bechtel Associates Professional Corporation, had conducted an investigation of the preservice failure of three reactor vessel anchor studs at the Consumers Power Company, Midland Plant, Unit 1. The results of that investigation, and interpretation of these results were presented in TES reports TR-3887-1, TR-3887-2, and TR-3887-1, Addendum 1. Subsequently, TES, under contract with Consumpers Power Company (CPCO) has conducted further testing. The primary purpose of this testing was to identify the cause of the high hardness in the Midland Unit studs. Secondary objectives included trying to learn more about the distribution of hardness in the failed stud (number 35) and determine the Charpy transition temperatures for number 3 stud material. This report presents the results of the further testing, and where appropriate, presents results from the previous reports. No attempt is made at interpretation of these results.

20384 (TES/TR—4599-2) Continued investigation of the failure of Midland Unit 1 RPV anchor studs analysis report. (Teledyne Engineering Services, Waltham, MA (USA)). 11 Feb 1981. 27p. Teledyne Engineering Services, 303 Bear Hill Rd., Waltham, MA 02154.

Teledyne Engineering Services (TES) under contract to Bechtel Associates Professional Corporation studied the preservice failure of three Reactor Vessel Anchor Studs in Consumers Power Company's (CPCO) Midland Unit 1. The results of this failure analysis were presented in TES reports TR-3887-1, TR-3887-1 Addendum 1, and TR-3887-2. While the investigation summarized in those reports clearly shows the cause of failure was stress corrosion in studs that were harder than expected for specific material, what was lacking was an explanation of how the studs came to be so hard. Subsequently, TES, under contract with CPCO has conducted further testing, the primary goal of which was to explain the cause of the high hardness. Secondary goals were to measure hardness distributions along the length of the studs and determine why some studs exhibited hardness gradients while others did not. The results of this further effort were presented in TR-4599-1, Further Investigations of High Hardness in Midland Unit 1 RPV Anchor Studs. This report provides a more detailed discussion and interpretation of the results presented in TR-4599-1 to the extent that these results relate to the cause for high hardness.

20385 (UCID—19470) Technical evaluation report on the proposed technical specification change on the surveillance requirements for the response-spectrum recorder at Arkansas Nuclear One, Unit 2. (Docket No. 50-368). Selan, J.C. (Lawrence Livermore National Lab., CA (USA)). 1 Feb 1983. Contract W-7405-ENG-48. 6p. NTIS, PC A02/MF A01. Order Number DE83007318.

This report documents the technical evaluation of the proposed Technical Specification surveillance requirements for the response-spectrum recorder at Arkansas Nuclear One, Unit 2. The evaluation is to determine if the proposed change in surveillance frequency will still maintain insurance that the seismic instrument will be adequately surveillanced to determine any performance degradation. The proposed change in surveillance frequency will insure that the response-spectrum recorder will adequately be tested and calibrated to detect system performance degradation.

20386 (DP-tr—39) Determination of isotopic and gravimetric content of uranium and plutonium by mass spectrometry in nitric acid extraction solutions. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA)). Sep 1982. Contract AC09-76SR00001. Translation source information not available . 17p. NTIS, PC A02/MF A01. Order Number DE83008578.

This technique is for measuring the isotopic content and concentrations of uranium and plutonium in P.W.R. type spent fuel extraction solutions.

REFER ALSO TO CITATION(S) 19800, 19801, 20450, 20457, 20463, 20479, 20480, 20481, 20482, 20483, 20484, 20485, 20486, 20487, 20488, 20489, 20490, 20623, 20667, 20688, 20694

20390 (ANL/NESC—117) FEVER; one-dimensional, few-group diffusion depletion program. Wang, C.L. (Institute of Nuclear Energy Research, Lung-Tan (Taiwan)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048117.

Maxima of - 150 mesh points 20 spatial regions 25 isotopes or aggregates in each region 4 groups It is assumed that the shape of the flux spectrum and the relative amplitude of the flux between zones does not change over the burnup time-step.

FEVER was developed to evaluate the effects of fuel depletion and control rod withdrawal upon the power distribution of the HTGR. The program performs one-dimensional, few-group depletion calculations. Options are available to adjust control poisons in various regions of the reactor, according to a specified sequence, to represent self-shielding of lumped poisons, and to calculate maximum k-effective at operating temperature and k-effective at shutdown temperature and cold shut-down k-effective at shutdown temperature for each time-step. The xenon-override problem can also be investigated.CDC CYBER73,175;CDC7600; FORTRAN IV; NOS/BE 1.2, 1.3 (CDC CYBER73), SCOPE 2.1 (CDC7600); 76,000 (octal) words of memory are required for execution.

20391 (ANL/NESC—261) GADOSE;DOSET; HTGR accident analysis dose calculations. Sedgley, D.B. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048261.

The problem is restricted to 5 time solutions and 5 dose-distance solutions. There is no limit on the number of decay chains but each chain is limited to 6 isotopes. DOSET accepts up to 8 discrete fission-product activity additions as a function of time .

The GADOSE program calculates radioactivity and doses resulting from instantaneous accidental release of activity while the companion program DOSET includes the effects of a time-dependent accidental fission product release for the HTGR type of plant. Given an initial fission product inventory released into a reactor vessel or containment volume, the quantity of each isotope is calculated at a number of times at a number of locations (in the containment, containment recirculating cleanup filters, leak collector, plant exhaust filters and in the atmosphere at a number of distances from the plant). Each decay chain is calculated separately considering buildup and decay of each isotope. Radiological doses are calculated for any three body organs and the whole body based on meteorological and physiological input parameters. Fallout and rainout are included.UNIVAC1108; FORTRAN IV; EXEC2; 32K memory.

20392 **(DOE/SF/02034—T80) Economic ground rules for the HTGR program for 1983.** (Gas-Cooled Reactor Associates, La Jolla, CA (USA)). Jan 1983. Contract AC03-78SF02034. 12p. NTIS, PC A02/MF A01. Order Number DE83007129.

Assumptions used for economic analyses within the HTGR program are discussed under the following main headings: basic assumptions; financial structure and factors; fuel and electricity cost projections; operations and maintenance costs; indirect rates, escalation, and interest during construction; availability; and uncertainty.

20393 **(Juel—1793) Development of a three-dimensional computer code for reconstructing power distributions by means of side reflector instrumentation and determination of the capabilities and limitations of this method.** Knob, P.J. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung). Jul 1982. 123p. (In German). NTIS (US Sales Only), PC A06/MF A01. Order Number DE83750185.

Diss. submitted to Technische Hochschule Aachen (Germany, F.R.).

This work is concerned with the detection of flux disturbances in pebble bed high temperature reactors by means of flux measurements in the side reflector. Included among the disturbances studied are xenon oscillations, rod group insertions, and individual rod insertions. Using the three-dimensional diffusion code CITATION, core calculations for both a very small reactor (KAHTER) and a large reactor (PNP-3000) were carried out to determine the neutron fluxes at the detector positions. These flux values were then used in flux mapping codes for reconstructing the flux distribution in the core. As an extension of the already existing two-dimensional MOFA code, which maps azimuthal disturbances, a new three-dimensional flux mapping code ZELT was developed for handling axial disturbances as well. It was found that both flux mapping programs give satisfactory results for small and large pebble bed reactors alike.

20394 **(Juel-Conf—43) Chemistry of the high-temperature reactor.** Nieder, R. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.)). Nov 1981. 131p. (In German). (CONF-8111130—). NTIS (US Sales Only), PC A07/MF A01. Order Number DE83750180.

From Seminar of the KTG on chemistry and nuclear waste disposal; Juelich, F.R. Germany (5 Nov 1981).

Main topics: Graphite corrosion, helium contaminations, fission- and activation products, tritium balance, experience during reactor operation, nuclear waste disposal.

20395 (Juel-Conf—43, pp 5-18) **Development trends of the high-temperature reactor.** Schulten, R. Nov 1981. (In German). NTIS (US Sales Only), PC A07/MF A01.

From Seminar of the KTG on chemistry and nuclear waste disposal; Juelich, F.R. Germany (5 Nov 1981).

In the long-term applications of the HTR-type reactor for the upgrading of coal and other processes to use nuclear process heat, possibilities arise to apply these methods on an industrial scale. From the point of view of engineering, it is possible to introduce big industrial HTR-type reactors of 1000 Msub(wel); small HTR-type reactors are already used on an industrial scale in the heat market.

20396 (Juel-Conf—43, pp 19-29) **Basic aspects of HTR chemistry.** Nieder, R. Nov 1981. (In German). NTIS (US Sales Only), PC A07/MF A01.

From Seminar of the KTG on chemistry and nuclear waste disposal; Juelich, F.R. Germany (5 Nov 1981).

Coolant chemistry describes the reactions of the trace impurities of helium with the core graphite and the metallic internals as well as the reactions of the impurities with each other. Graphite corrosion in particular has special importance in practice. Further, the formation of inflammable gas mixtures must be prevented.

20397 (Juel-Conf—43, pp 53-76) **Helium impurities in a PNP-primary coolant circuit.** Reif, M. Nov 1981. (In German). NTIS (US Sales Only), PC A07/MF A01.

From Seminar of the KTG on chemistry and nuclear waste disposal; Juelich, F.R. Germany (5 Nov 1981).

The concentration of impurities to be expected have been defined in consideration of recent findings concerning the rates of infiltration and formation and the reaction mechanisms of the impurity components in the circuit. The data obtained correspond with the requirements on the metallic high-temperature components as well as with the requirements of limited graphite corrosion.

20398 (Juel-Conf—43, pp 77-84) **Behaviour of fission products in fuel elements of the AVR-core.** Hilgedieck; Wahl, J. Nov 1981. (In German). NTIS (US Sales Only), PC A07/MF A01.

From Seminar of the KTG on chemistry and nuclear waste disposal; Juelich, F.R. Germany (5 Nov 1981).

The fuel elements of the THTR-1-type-, THTR-2-type-, and CFB-2-type reactor have an extraordinary retention capacity for all fission products. Pressed-carbide fuel elements, however, at a temperature above 300°C release considerable Sr- and Eu-activities as a result of diffusion through intact PyC-layers. For GLE-1 and GFB-1 fuel elements a considerable release of cesium has been observed which is caused by defective coated particles.

20399 (Juel-Conf—43, pp 85-94) **Behaviour of fission- and activation products in the cooling circuit.** Malinowski, J.; Wahl, J.; Nieder, R. Nov 1981. (In German). NTIS (US Sales Only), PC A07/MF A01.

From Seminar of the KTG on chemistry and nuclear waste disposal; Juelich, F.R. Germany (5 Nov 1981).

The concentration of the noble gases in the primary circuit is low. It is not much influenced by the helium purification plant. Concerning the concentrations of solid fission products in helium, even lower values have been found. The graphite in the core is a sink for the solid fission products. Only krypton 85 and xenon 133 are released into the environment.

20400 (Juel-Conf—43, pp 95-106) **Tritium-balance in the HTR-type reactor.** Roellig, K. Nov 1981. (In German). NTIS (US Sales Only), PC A07/MF A01.

From Seminar of the KTG on chemistry and nuclear waste disposal; Juelich, F.R. Germany (5 Nov 1981).

In a 2250 MWsub(th)-HTR-type reactor 16,000 Ci of tritium are produced per full load year; a major part of it is retained in the fuel elements. More than 99% of the released tritium comes into the gas purification plant where it is burnt catalytically. Tritium sinks of the primary coolant circuit are sorption in the graphite and the permeation through heat-exchanging components.

20401 (Juel-Conf—43, pp 107-122) **Operating experience in HTR-type reactor chemistry.** Forsyth, N.; Nieder, R. Nov 1981. (In German). NTIS (US Sales Only), PC A07/MF A01.

From Seminar of the KTG on chemistry and nuclear waste disposal; Juelich, F.R. Germany (5 Nov 1981).

Operating experience of the Dragon-, Fort St. Vrain and Peach-Bottom reactors as well as with the AVR-reactor have proved that the 'coated particles' are suitable. Helium impurities, water ingress on a large scale, and small oil infiltrations only cause outages. High CH_4 concentrations do not occur. The He-3 concentration of the natural helium leads only to a rather low tritium contamination.

20402 **(Juel-Spez—150) Program module simulating a gas-heated steam generator with steam condensation in the primary flow channel.** Meister, G. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Nukleare Sicherheitsforschung). May 1982. 45p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE83750192.

A program module, written as a FORTRAN subroutine, is described which simulated the behaviour of a countercurrent steam generator heated on the primary side by a mixture of a noncondensable gas and water steam. The module simulates possible steam condensation in the primary channel. The routine which has been optimized with regard to computing time requirements can be used, for instance, as a module in computer programs simulating water ingress accidents in high temperature reactors.

20403 **(NUREG/CR—2929) Feasibility of monitoring the strength of HTGR core support graphite: Part III.** Morgan, W.C.; Davis, T.J.; Thomas, M.T. (Pacific Northwest Lab., Richland, WA (USA)). Feb 1983. Contract AC06-76RL01830. 49p. (PNL—4449). NTIS, PC A03/MF A01 - GPO $4.75. Order Number DE83007941.

Methods are being developed to monitor, in-situ, the strength changes of graphite core-support components in a High-Temperature Gas-Cooled Reactor (HTGR). The results reported herein pertain to the development of techniques for monitoring the core-support blocks; the PGX graphite used in these studies is the grade used for the core-support blocks of the Fort St. Vrain HTGR, and is coarser-grained than the grades used in our previous investigations. The through-transmission ultrasonic velocity technique, developed for monitoring strength of the core-support posts, is not suitable for use on the core-support blocks. Eddy-current and ultrasonic backscattering techniques have been shown to be capable of measuring the density-depth profile in oxidized PGX and, combined with a correlation of strength versus density, could yield an estimate of the strength-depth profile of in-service HTGR core support blocks. Correlations of strength versus density and other properties, and progress on the development of the eddy-current and ultrasonic backscattering techniques are reported.

20404 **(ORNL/TM—8141) Survey analysis of radiation levels in the HTGR lower regions.** Slater, C.O.; Cramer, S.N. (Oak Ridge National Lab., TN (USA)). Feb 1982. Contract W-7405-ENG-26. 49p. NTIS, PC A03. Order Number DE82011305.

A survey analysis of radiation levels within the General Atomic conceptual 900-MW(e) [~ 2000-MW(t)] steam-cycle High-Temperature Gas-Cooled Reactor (HTGR) was performed. Primary emphasis was placed on calculating thermal neutron flux levels in the HTGR lower regions after giving due considerations to (1) neutron streaming through the large coolant holes in the bottom reflectors and support blocks and (2) thermal neutron streaming among boron pins within the graphite reflector blocks. The final aim was to determine the effect of this composite neutron streaming on the thermal neutron flux in the cover plates for the sidewall insulation. A design limit thermal neutron fluence of 10^{17} cm^{-2} was placed on the cover plates. Calculated results show this limit being exceeded by a factor of 10.5. However, large uncertainties in the calculations indicate a need for a definitive comparison of calculated and experimental results for a prototypic geometry. Other radiation levels were calculated to be well within the dsign limits.

2104 Power Reactors, Non-breeding, Otherwise Moderated Or Unmoderated

20405 **(CONF-810130—3) CANDU nuclear power plants: safety, licensing, and environmental considerations.** van Erp, J.B. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 26p. NTIS, PC A03/MF A01. Order Number DE83007772.

From American Association for the Advancement of Science symposium; Toronto, Ontario, Canada (8 Jan 1981).

CANDU nuclear power plants have a number of safety-related and environmental characteristics, which differ substantially from those of light-water-reactor (LWR) plants. Among the principal of these CANDU characteristics are: (1) the presence of a large low-temperature heat sink dispersed throughout the core region, (2) the absence of thick-walled, highly radioactive primary system components, and (3) the possibility of replacing vital core internals, including pressure tubes. The paper examines these and other characteristics and concludes that (a) the CANDU reactor can be expected to have a quite favorable overall probabilistic risk profile, (b) the environmental impact associated with CANDU reactors is expected to be favorably affected by the possibility of reusing the same site and civil engineering structures for successive generations of power plants through refurbishing and decommissioning of old plants. It is expected that introduction of CANDU reactors into a country, having a licensing process which has been strongly influenced by LWR technology, will not present any serious licensing problems.

20406 **Possibility of multiple temperature maxima in geologic repositories for spent fuel from nuclear reactors.** Beyerlein, S.W.; Claiborne, H.C. (Chemical Technology Division, Oak Ridge National Laboratory, Oak Ridge, Tennessee 37830). *Journal of Heat Transfer;* **104**: No. 1, 180-217(Feb 1982). Contract W-7405-ENG-26.

Heat transfer studies for CANDU spent fuel repositories showed that two temperature maxima at the source could occur: one at ~60 and another one at ~13,000 yrs. Spent fuel from pressurized water reactors (PWRs) did not exhibit this phenomenon. Because CANDU spent fuels display a monotonically decreasing heat generation rate, it is not immediately obvious why such behavior occurs. This paper demonstrates that the "double-peak" phenomenon is due to the presence of the right mixture of short and long-lived nuclides in the fuel and that the second peak does not occur for repository sizes less than ~1 km^2. For larger repositories, radial and surface heat transfer reduces the magnitude of the second peak.

20407 **(ANL/NESC—372) RAPFU; fuel cycle parameters for fast breeders.** Greebler, P.; Cowan, C. (General Electric Co., San Jose, CA (USA). Advanced Products Operation). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048372.

Four plutonium recycle schemes are available. The most complicated of these uses two core isotopic zones plus a zone containing the blanket zones. The other three use only a single core isotopic zone and allow a selection to be made from three alternate mixtures in the plutonium discharged from the core and blanket regions and recycled back into the core regions. Up to 100 regions of different composition may be used, and the regions within any zone of fixed plutonium input isotopic composition do not have to be connected.

RAPFU calculates equilibrium fuel cycle isotopics in fast breeder reactors. The recycled plutonium is permitted to have different isotopic compositions in two different core zones, and several recycle schemes are available as options. Output data includes the initial, average, and discharged fuel isotopic concentrations for each region of the core zones and the blankets, breeding ratio, doubling time, and (optionally) fuel costs calculated using simplified relationships.GE635; FORTRAN IV.

20408 **(ANL/NESC—454) PHENIX; 2-dimensional diffusion burnup refueling history.** Hirons, T.J. (Lawrence Livermore National Lab., CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048454.

Maximum of - 50 energy groups Variable dimensioning is used with nearly all subscripted variables stored in a single 27,000 word array.

PHENIX is a two-dimensional, multigroup, diffusion-burnup-refueling code for use with fast reactors. The code is designed primarily for fuel-cycle analysis of fast reactors and can be used to calculate the detailed burnup and refueling history of fast breeder reactor concepts having any generalized fractional batch reloading scheme. Either ordinary keff calculations or searches on material concentration or region dimensions can be performed at any time during the burnup history. The complete fuel cycle history can be calculated in one run, or the individual burnup intervals can be treated separately. The refueling option of the code accounts for the spatial flux shifts over the reactor lifetime in the calculation of fuel discharge.CDC6600; FORTRAN IV; SCOPE 3.2; 65K memory, 1 random-access storage device (disk), and 2 magnetic tape units. If cross sections are input from cards, only one tape unit is required. The other tape unit is used for flux guesses or dumps (if desired), and to store burnup data needed for the refueling portion of the program.

20409 (ANL/NESC—458) **VELVET2; turbulent flow in LMFBR rod bundle.** Bender, D.J.; Magee, P.M. (General Electric Co., Sunnyvale, CA (USA). Breeder Reactor Development Operation). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048458.

Maxima of - 10 radial divisions in the fuel 5 radial divisions in the clad 10 radial divisions in the coolant between the outer edge of the buffer layer and one-half the pitch 10 circumferential divisions; Source deck (3486 cards) Sample problem (51 cards) Reference report, GEAP-10052, and Subroutine Descriptions.

VELVET2 solves the coupled, heat-transfer equations in the fuel, gap, cladding, and coolant for a triangular-spaced, close-packed, fuel rod bundle with liquid metal coolant. The model includes temperature-dependent material properties, turbulent velocity distribution in the coolant, and contributions to coolant heat transfer by turbulent mixing.GE635; FORTRAN IV; GECOS; 32K memory.

20410 (ANL/NESC—480) **FUMBLE; fast reactor fuel burnup & management.** Greebler, P.; Cowan, C.L. (General Electric Co., Sunnyvale, CA (USA). Breeder Reactor Development Operation). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048480.

FUMBLE computes the fuel burnup in reactor operations. This includes the evaluation of reactivity effects, breeding (or depletion) and inventories of fuel, and fuel costs for changing economic conditions and supplied fuel compositions throughout the reactor lifetime (or for as many refueling operating intervals as desired). Considerable flexibility is allowed in the specifications of reactor refueling, including fuel compositions for the startup reactor, recycle schemes and fissile makeup compositions for subsequent core loadings, amounts of fuel to be replaced in different positions of the reactor at any refueling, and shuffling of fuel from one part of the reactor to another or temporarily storing fuel discharged from the reactor for later additional burnup. The refueling specifications may be changed from one refueling operating interval to another, as well as operating interval time, power rating, and load factor. Fuel costs may be evaluated for several different sets of cost input data (different economic assumptions) and may be based on net costs accrued and energy produced by spent fuel batches and/or on net costs incurred for all fuel held and energy produced by the entire reactor for each operating interval.GE635; FORTRAN IV; GECOS-III; Minimum computer memory is 48K on the GE635. Two tapes and one auxiliary which may be required for some cases.

20411 (ANL/NESC—495) **SYN; 2-dimensional synthesis multigroup diffusion and 1-group depletion.** Kelley, M.D. (General Electric Co., Sunnyvale, CA (USA). Breeder Reactor Development Operation). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048495.

SYN contains two major segments, BISYN and BICYCL. The BISYN segment solves the two-dimensional multigroup neutron diffusion theory equations in r,z or x,y geometry using a noniterative synthesis method. This approach is designed to greatly reduce the computer cost of running two-dimensional multigroup problems at the risk of some loss in accuracy of the detailed flux distribution. This segment also contains a perturbation and effective delayed neutron fraction calculation. The BICYCL segment uses output from BISYN to solve the one-group neutron depletion equations. BICYCL allows the user to search on makeup or recycle isotopic compositions for a first cycle of a first core or for equilibrium concentrations. It also has provisions for fuel shuffling and the option to cycle back to BISYN in order to update the fluxes, one-group cross sections, etc.GE635; FORTRAN IV and GMAP; GECOS III; 51K of fast memory, 2 tape drives and 821,760 words of peripheral storage.

20412 (ANL/NESC—501) **ENDRUN2; multigroup constants from ENDF/B data.** Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Turner, J.E. (General Electric Co., San Jose, CA (USA). Nuclear Energy Div.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048501.

ENDRUN2 is used to calculate multigroup constants from energy-dependent, microscopic cross sections, resonance parameters, and inelastic level data input in the evaluated nuclear data file (ENDF/B) formats. Data is processed for one material at a time and the output multigroup file includes both infinitely-dilute group cross sections and self-shielding, Bondarenko-type f-factors so that the resulting generalized file is independent of reactor composition. The multigroup data may be output on punched cards, a standard library tape, or plotted over any energy range.GE635; FORTRAN IV except for use of RWSBT and NPOST in the GE compressed binary input and output routines. FORTRAN versions of these routines are available, also.; GECOS III; The code requires 52K memory, including a 10K overlap with loading routines. Up to 5 tapes and 7 auxiliary units (disks in the authors' environment) may be required, but the number of tapes may be reduced by use of permanent disk files with the card reader as the input unit.

20413 (ANL/NESC—868R) **PECS3; probabilistic evaluation cladding life.** Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy, J.H.; Krommenhock, F.J. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048868.

Maxima of - 200 hour time-step 30 rod groups 10 burnup increments per rod group 100 bins per damage fraction histogram 100 bins per optional graph 80 bins per time-to-failure histogram Minimum of - 25 hour time-step The user can generate a regression equation predicting a selected response as a function of up to 19 selected independent variables. .

PECS3 is designed to calculate the probability distributions for various lifetime criteria for sealed plenum FBR fuel pins. The PECS model is capable of predicting cladding stresses and strains and accumulated damage due to fission gas pressure and fuel-cladding mechanical interaction. The position of failure may be located by analyzing a single pin at more than one axial location. Whole-core analyses may be performed by modeling up to 30 pin groups simultaneously. The damage rule and failure criteria used are selectable by the user for each analysis.CDC7600; FORTRAN IV; SCOPE 2.1; 53,000 (octal) words of small core memory and 65,000 (octal) words of large core memory are necessary for execution.

20414 (ANL/NESC—885R) **SWAAM1; LMFBR sodium-water reaction analysis.** Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy, J.H.; Valentin, R.A. (Argonne National Lab., IL (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048885.

From 8 to 50 elements can be used to represent the single-membrane disk.

SWAAM1 is designed for analysis of the major consequences of large-scale sodium-water reactions in the secondary system of an LMFBR. For a typical system analysis, SWAAM1 treats rapid-transient effects of the order of 1 second or less of real time. The program computes coupled transient events in the shell-side sodium, the tube-side water/steam systems, and the reaction-bubble zone resulting from tube failures.IBM370,3033; FORTRAN IV; OS/370 (IBM370), OS/3033 (IBM3033); 950K bytes of memory are required for execution.

20415 (ANL/NESC—904R) SUPERENERGY2; steady-state LMFBR core analysis. Basehore, K.L. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048904.

SUPERENERGY2 is applicable only to LMFBR assemblies in the steady-state forced convection flow regime.

SUPERENERGY2 was written to perform steady-state, thermal-hydraulic design and performance analyses on multiple LMFBR assemblies. The code automatically generates the geometry and nodes for any number of single- or double-ducted assembly types based on a few critical dimensions. Radial node options are either a standard fine-mesh subchannel layout based on the number of fuel pins or a lumped representation of one to eight rings formed at the user's request. Assemblies may be coupled for interassembly heat transfer effects, using either a conduction or flow solution in the interassembly gap. Generalized boundary conditions can be applied to the noncoupled bundle faces, and a duct wall gamma heating option is available. The code contains default sodium and stainless steel property correlations; mixing parameter flowsplit, and heat transfer correlations; all can be overriden by input data. The calculated bundle temperature profiles are printed in map form at specified locations for ease of use. SUPERENERGY2 can compute problems ranging from a single bundle operating condition parametric study to a large core sector problem determining the effect of interassembly heat transfer on the duct temperature profile for core restraint analysis.CDC7600,CYBER175; FORTRAN IV; SCOPE 2.1, NOS 1.3; Storage requirements vary with problem size. For the given dimensions 53K words of small core memory (SCM) and 66K of large core memory (LCM) are required. The program can also be executed entirely in SCM. If this is the case 155,000 (octal) words of memory are required. The auxiliary program CONVERT requires 21,000 (octal) words of memory for execution.

20416 (ARSD-SP—029) Doppler and sodium void worth effect on the progression of an HCDA LOF event in CRBRP heterogeneous core. Switick, D.M.; Rhow, S.K.; McElroy, J.L. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). 1982. Contract AM03-76SF00893. 7p. (CONF-821103—85). NTIS, PC A02/MF A01. Order Number DE83005223.

From American Nuclear Society winter meeting; Washington, DC, USA (14 Nov 1982).

The CRBRP has adopted a heterogeneous core design where some blanket assemblies (referred to as the internal blanket assemblies) are interspersed with driver fuel assemblies. the heterogeneous core has a low sodium void worth relative to a homogeneous core which was previously considered in the design. Furthermore, the heterogeneous core has a significant share of the Doppler and sodium void worth distributed in the internal blanket assemblies. This paper discusses the impact of such heterogeneous core characteristics on the progression of a hypothetical, unprotected (without scram) LOF event.

20417 (CNEN-RT/ING—82-5) Analysis of characteristic curves of the PC.1 and PC.2 centrifugal pumps of the CPC-1 system. Manca, O. (Comitato Nazionale per l'Energia Nucleare, Rome (Italy)). Jan 1982. 18p. (In Italian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83900867.

An analysis is made of characteristic curves relative to single function of pumps and to a parallel function as obtained from test data. Graphic data are given for water pumps and pumps transporting sodium. 4 references, 7 diagrams.

20418 (CONF-820465—2) Seventeen years of LMFBR experience: Experimental Breeder Reactor II (EBR-II). Perry, W.H.; Lentz, G.L.; Richardson, W.J.; Wolz, G.C. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 17p. NTIS, PC A02/MF A01. Order Number DE83007671.

From American Power conference on nuclear regulation-future directions; Chicago, IL, USA (26 Apr 1982).

Operating experience at EBR-II over the past 17 years has shown that a sodium-cooled pool-type reactor can be safely and efficiently operated and maintained. The reactor has performed predictably and benignly during normal operation and during both unplanned and planned plant upsets. The duplex-tube evaporators and superheaters have never experienced a sodium/water leak, and the rest of the steam-generating system has operated without incident. There has been no noticeable degradation of the heat transfer efficiency of the evaporators and superheaters, except for the one superheater replaced in 1981. There has been no need to perform any chemical cleaning of steam-system components.

20419 (CONF-820628—21) Kinetics of radiation-induced segregation in ternary alloys. Lam, N.Q.; Kumar, A.; Wiedersich, H. (Argonne National Lab., IL (USA); Missouri Univ., Rolla (USA). Dept. of Nuclear Engineering). 1982. Contract W-31-109-ENG-38. 24p. NTIS, PC A02/MF A01. Order Number DE83007741.

From 11. international symposium on effects of radiation on materials, American Society for Testing and Materials; Scottsdale, AZ, USA (28 Jun 1982).

Model calculations of radiation-induced segregation in ternary alloys have been performed, using a simple theory. The theoretical model describes the coupling between the fluxes of radiation-induced defects and alloying elements in an alloy A-B-C by partitioning the defect fluxes into those occurring via A-, B-, and C-atoms, and the atom fluxes into those taking place via vacancies and interstitials. The defect and atom fluxes can be expressed in terms of concentrations and concentration gradients of all the species present. With reasonable simplifications, the radiation-induced segregation problem can be cast into a system of four coupled partial-differential equations, which can be solved numerically for appropriate initial and boundary conditions. Model calculations have been performed for ternary solid solutions intended to be representative of Fe-Cr-Ni and Ni-Al-Si alloys under various irradiation conditions. The dependence of segregation on both the alloy properties and the irradiation variables, e.g., temperature and displacement rate, was calculated. The sample calculations are in good qualitative agreement with the general trends of radiation-induced segregation observed experimentally.

20420 (CONF-821103—84) Intrinsic reactivity feedback characteristics for safety analysis of heterogeneous and homogeneous LMFBR core designs. Doncals, R.A.; Lake, J.A. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). 1982. Contract AC15-76CL50003. 3p. NTIS, PC A02/MF A01. Order Number DE83007257.

From American Nuclear Society winter meeting; Washington, DC, USA (14 Nov 1982).

This paper presents a comparison of the intrinsic reactivity feedback characteristics of homogeneous and heterogeneous LMFBR designs. The comparisons are shown for a 1000 MWth LMFBR core design. However, the applicability of the conclusions drawn from these comparisons are generic to larger LMFBRs. Consistent sodium void worth distributions have been calculated for heterogeneous and homogeneous 1000 MWth LMFBR core designs. The basic calculations were performed with three dimensional models using ENDF/B-III cross section data and first order perturbation theory.

20421 (CONF-821119—12) Diversion analysis and safeguards measures for liquid-metal fast-breeder reactors. Paper IAEA-SM-260/6. Persiani, P.J.; Ermakov, S.V. (Argonne National Lab., IL (USA); International Atomic Energy Agency, Vienna (Austria)). 1982. Contract W-31-109-ENG-38. 19p. NTIS, PC A02. Order Number DE83007734.

From International symposium on recent advances in nuclear materials safeguards; Nienna, Australia (8 Nov 1982).

The objective of the study is to perform a diversion analysis and an assessment of the available safeguards methods and systems for verifying inventory and flow of nuclear material in accessible and inaccessible areas of liquid-metal fast breeder reactor, LMFBR, systems. The study focuses primarily on the assembly-handling operations, assembly storage facilities, and reactor operations facilities relating to experimental, demonstration and prototypal reactor plants. The safeguards systems and methods presented are considered to be feasible for development and implementation within the resource limitation of the IAEA and are considered to be consistent with the objectives, requirements, and constraints of the IAEA documents INFCIRC/153 and INFCIRC/66-Rev-2.

20422 (DOE/ET/37227—5) **Surface radiation properties of ThO_2 and other reactor materials.** Chan, S.H.; Ma, H.H. (Wisconsin Univ., Milwaukee (USA). Dept. of Mechanical Engineering). Dec 1979. Contract AC02-76ET37227. 106p. NTIS, PC A06. Order Number DE82013559.

This technical report summarizes the results obtained on surface radiation properties of ThO_2 and other related reactor materials. Specifically, the present study provides surface radiation properties of three nuclear reactor materials; thorium dioxide, sodium and steel (99 Fe + 1 C). First, based on transmission spectra and Kramers-Kronig analysis, the complex refractive index, which is fundamental to surface radiation property calculations, of ThO_2 is presented over a wide spectral range. Then depending on the contacting media, three types of the surface are considered. They are the interfaces between ThO_2 and Sodium, ThO_2 and Steel (99 Fe + 1 C) as well as ThO_2 and a gas. For each interface, the spectral interface reflectance from one side of the medium to the other side is evaluated for all wavelengths.

20423 (DOE/ET/37240—94) **Coolant mixing in LMFBR rod bundles and outlet plenum mixing transients. Progress report, September 1, 1981-November 30, 1981.** Todreas, N.E. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Nuclear Engineering). Jan 1982. Contract AC02-76ET37240. 39p. NTIS, PC A03/MF A01. Order Number DE83007498.

Information is presented concerning coolant mixing in bundle geometry for wrapped and base rods and models for mixed convection subchannel velocity fields in rod bundles.

20424 (DOE/ET/37240—97TR) **Wire-wrapped rod-bundle heat-transfer analysis for LMFBR.** Wong, C.N.C.; Todreas, N.E. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Nuclear Engineering). Jul 1982. Contract AC02-76ET37240. 259p. NTIS, PC A12/MF A01. Order Number DE83007502.

Helical wire wraps are widely used in the LMFBR fuel and blanket assemblies to provide coolant mixing and maintain proper spacing between fuel pins. The presence of the helical wire, however, may possibly induce heat transfer problems, such as the uncertainty of the maximum clad temperature as a result of the contact between the wires and the pins. In this study, the detailed transient three dimensional velocity and temperature distributions for the coolant around the pin will be determined by solving the governing momentum and energy equation numerically. A computer code HEATRAN has been developed to perform this calculation. Before the computer code HEATRAN is applied to the wire wrapped rod bundle problem, it is used to analyze a wide range of fluid and heat transfer problem to verify its capabilities.

20425 (DOE/ET/37240—99) **Coolant mixing in LMFBR rod bundles and outlet-plenum mixing transients. Progress report, March 1, 1982-May 31, 1982.** Todreas, N.E. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Nuclear Engineering). Dec 1982. Contract AC02-76ET37240. 74p. NTIS, PC A04/MF A01. Order Number DE83007497.

Information is presented concerning fluid mixing in bundle geometry of wrapped and base rods and criteria for the onset of mixed convection in vertical rod bundles.

20426 (GAO/EMD—82-123) **Questions regarding Clinch River Breeder Reactor project funding and costs.** (General Accounting Office, Washington, DC (USA)). 1982. 5p. General Accounting Office, P.O. Box 6015, Gaithersburg, MD.

Additional information is presented concerning the funding and costs related to the Clinch River Breeder Reactor.

20427 (GAO/EMD—82-128) **Information on the cost of plutonium needed to operate the Clinch River Breeder Reactor for its 5-year demonstration.** (General Accounting Office, Washington, DC (USA). Energy and Minerals Div.). 17 Sep 1982. 6p. General Accounting Office, P.O. Box 6015, Gaithersburg, MD.

Requested information is presented concerning the background on the CRBR Project and its plutonium requirements, and analysis of sources and cost of acquiring plutonium for CRBR fuel.

20428 (GAO/EMD—82-131) **Interim report on GAO's review of the total cost estimate for the Clinch River Breeder Reactor project .** (General Accounting Office, Washington, DC (USA). Energy and Minerals Div.). 23 Sep 1982. 14p. General Accounting Office, P.O. Box 6015, Gaithersburg, MD 20760.

The following sctions discuss (1) the process used by the DOE to estimate CRBR project costs; (2) the inflation allowance used in DOE's cost estimate, which could overstate CRBR costs; (3) the cost of plutonium, revenue projections, and contingency allowances, which may understate the total cost estimate; and (4) several items which are not included in the cost estimate but which, in our view, either will or could result in cost to the Government.

20429 (LA—9630-PR) **Examination of fast-reactor fuels and FBR analytical quality-assurance standards and methods. Progress report, July 1-September 30, 1982.** Maraman, W.J. (comp.). (Los Alamos National Lab., NM (USA)). Jan 1983. Contract W-7405-ENG-36. 10p. NTIS, PC A02/MF A01. Order Number DE83008360.

This is the thirty-second quarterly report of the Examination of Fast Reactor Fuels and Fast Breeder Reactor (FBR) Analytical Quality-Assurance Standards and Methods at the Los Alamos National Laboratory. Information is presented concerning equipment development; analytical chemistry; requests from DRRT; and quality assurance.

20430 (NUREG/CP—0034-Vol.1, pp 1-19) **Physics assessments of LMFBR integral parameters.** Lineberry, M.J.; McFarlane, H.F.; Collins, P.J. (Argonne National Lab., Idaho Falls, ID). Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

Recent progress in assessing the status of measurement and analysis of key fast reactor integral parameters is reviews. The relationship between the parametrs (^{238}U capture, fission rates, sodium-void reactivity Doppler reactivity coefficient, small sample reactivity, and criticality) and typical design and safety parameters in LMFBRs is explained. Major discrepancies between calculations with ENDF/B-Version IV data and the criticl experiments are examined, and recent progress in resolution of some long-standing discrepancies is presented.

20431 (NUREG/CP—0034-Vol.1, pp 20-35) **Sodium-cooled fast reactor thermal-hydraulics.** Todreas, N.E. (Massachusetts Inst. of Tech., Cambridge). Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

The thermal-hydraulics of LMFBR core performance under nominal and operational transient conditions are reviewed. Two predominant flow regimes are identified - forced convection and mixed convection. It is concluded that forced convection behavior is relatively well-predicted although improvements in the prediction of temperatures of irradiated ducts and of severly distorted bundles are needed. Mixed convection behavior has not yet been well studied. Methods to predict the onset of mixed convection, turbulence and recirculation are needed.

20432 (NUREG/CP—0034-Vol.1, pp 78-92) **Sodium-void reactivity in LMFBRs: a physics assessment.** Beck, C.L.; Lineberry, M.J.; McFarlane, H.F.; Olsen, D.N. (Argonne National Lab., Idaho Falls, ID). Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

An extensive recalculation of sodium-void measurements from the US critical experiment program has been completed. Three-dimensional diffusion-perturbation methods and ENDF/B-Version IV data in 28 groups were used throughout this study. The results of the calculations establish the degree of confidence in the prediction of sodium-void worths in typical LMFBR environments, and further demonstrate the usefulness of a two-componet fitting process for biasing calculations in order to produce better predictions of void worths. Measurements in ninety-five zones wre analyzed, resulting in a mean C/E (calculation/experiment) ratio of 1.12 +- 0.20 before fitting, and 0.99 +- 0.09 after fitting. Bias factors for both leakage and non-leakage components were in the range 0.85 to 0.92 for a variety of design parameter variations, i.e. a number of different subsets of the data base. These results may be used to extrapolate from the critical assembly data to general LMFBR application and to estimate the uncertainty of the predicted values.

20433 (NUREG/CP—0034-Vol.1, pp 93-107) **Calculated and measured reactivities in the U9 critical assemblies.** Schaefer, R.W.; Bucher, R.G. (Argonne National Lab., IL). Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

A set of three benchmark fast critical assemblies, designated U9, had a 9% enriched uranium core composition and three degrees of cell heterogeneity. An extensive series of reactivity experiments was performed in U9, which was aimed at diagnosing the bias between measurement and calculation. Both the measurement and calculation techniques include substantial modifications of the standard ANL methods. The experiments clearly show a trend of increasing calculational error with increasing cell heterogeneity using conventional analysis, and the effectiveness of an adjoint correction in removing this trend. The ratio of calculated to measured worth (C/E) for small material samples near the core center is near unity for most samples. Perturbations of the normal core environment, caused by the measurement technique, are shown to affect sample worth C/E's by only about 1%. An alternative determination of fuel worth, largely independent of the small sample approach, also has a C/E near unity. These U9 results are a major contribution to a database for reevaluating the longstanding central worth discrepancy.

20434 (NUREG/CP—0034-Vol.1, pp 118-132) **Extrapolation of small sample Doppler reactivity measurements.** Kaiser, R.E.; Harper, H.A.; Beck, C.L.; Carpenter, S.G. (Argonne National Lab., Idaho Falls, ID). Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

An application of ^{238}U small sample Doppler measurements to the confirmation of LMFBR design calculations is proposed. The method uses the Doppler measurements in conjunction with $^{238}\mathrm{U}(n,\gamma)$ data to predict the radial behavior of the Doppler reactivity C/E, and includes a description of azimuthal variations by using the measured values to normalize a calculated map. The result is a spatial map which can be used, along with data from the SEFOR experiments, to test design level calculations of Doppler reactivity.

20435 (NUREG/CP—0034-Vol.1, pp 133-147) **Assessment of physical characteristics of heterogeneous configurations with variable fertile volume.** Scholtyssek, W. (Kernforschungszentrum, Karlsruhe, Germany); Daguzan, G.; Humbert, G.; Martini, M.; Ruelle, B.; Kappler, F.; Norvez, G. Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

The RACINE program is presented. This program is made in the framework of the collaboration of CEA-ENEA-DEBENE and is devoted to the study of the physics aspects of heterogeneous cores on the basis of a parametric approach (fertile amount, fertile ring position, thickness etc). Experimental results are presented, together with the analysis performed both with CEA and DEBENE methods.

20436 (NUREG/CP—0034-Vol.1, pp 177-193) **Validation of alternative methods and data for a benchmark fast reactor depletion calculation.** Toppel, B.J.; Adams, C.H.; Lawrence, R.D.; Henryson, H. II; Derstine, K.L. (Argonne National Lab., IL). Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

Alternative neutronics models, data processing procedurs, and data bases have been used to examine two 383.5 day burn cycles for a 1000 MWe heterogeneous LMFBR design developed by the Large Core Code Evaluation Working Group (LCCEWG). the diffusion theory neutronics methods used are finite difference, nodal, and spatial flux synthesis. Four, eight, and twenty-group multigroup corss sections based on ENDF/B-IV and ENDF/B-V data bases are compared. The effect of parked control rods as compared with rods moving during the burn cycles is examined. Various performance parameters are compared including burnup reactivity swings, rod worths, fuel burnup, power splits, and sodium void reactivity effects. The sensitivity of the results to choices in the modeling process are discussed.

20437 (NUREG/CP—0034-Vol.1, pp 194-208) **Determination of the core power distribution in the Clinch River Breeder Reactor.** Lake, J.A.; Varner, S.K.; Rittenberger, R.V. (Westinhouse Electric Corp., Madison, PA). Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

The fuel and blanket assembly layout in the CRBRP heterogeneous core is designed to produce a radially flat power distribution which maximizes the total core power with respect to peak linear power limits. The core power distribution is the basis for the demonstration of power-to-melt margins, the determination of flow orificing requirements, and the prediction of temperature and irradiation conditions which are the driving functions behind the fuel and blanket lifetime evaluations. The few-group, diffusion-theory based design methdology and the ENDF/B cross section data are challenged by the unique characteristics and sensitivities of the heterogeneous CRBRP core arrangement. Consequently, an extensive critical experiments program has been performed at ZPPR to assess design bias factors and uncertainties in key integral physics parameters. These parameters include the reactor critical eigenvalue, control rod worth characteristics, isotopic fission and capture rate distributions and gamma heating as they are influenced by fuel/blanket interfaces, core burnup, blanket plutonium accumulation, etc., and core safety characteristics like the sodium void worth distribution. The results of the analyses of these experiments reflect deficiencies in cross section data, cross section processing and/or reactor calculational methodology approximations.

20438 (NUREG/CP—0034-Vol.1, pp 254-270) **Analysis of neutronic space-time effects in large LMFBR's with thermal-hydraulic feedback using FX2-TH nuclear reactor kinetics code and mode expansion of the neutron flux shape function.** Yarlagadda, B.S. (Argonne National Lab., IL). Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

For a delayed critical transient in an LMFBR, the dependence of the local flux tilt on the degree of heterogeneity in the core configuration was examined. Using a mode expansion of te neutron flux shape function, decoupling the resulting mode kinetics equations and utilizing the prompt jump approximation, an expression for the i th harmonic local flux tilt was developed. According to this expression, the i th harmonic local flux tilt tau/sub i/(r Vector, t) is inversely proportional to the sum of the eigenvalue separation between the i th harmonic and the fundamental mode and the delayed neutron fraction and is directly proportional to a time dependent factor T/sub i/(t) and a space dependent factor G/sub i/(r Vector). The modified eigenvalue separation and G/sub i/(r Vector) are known when the eigenvalues and eigenfunctions of the unperturbed reactor are available. Thus if t/sub i/(t), which depends upon the perturbation, varies little in comparison with the modified eigenvalue separation from one core configuration to another, a simple measure of the i th harmonic local flux tilt is feasible. This flatness criterion for t/sub i/(t) has been investigated by inserting 2 cents/sec ramp reactivity in three core configurations. During the transient, the shape function was calculated with the FX2-Th code and tau/sub i/(r Vector,t) and T/sub i/(t) were extracted using mode expansion of the shape function. The results of this analysis are presented.

20439 (NUREG/CP—0034-Vol.1, pp 406-423) **Validation studies of the ENDF/MC^2-2/SDX.** McKnight, R.D.; Hwang, R.N.; Stenberg, C.G.; Blomquist, R.N. (Argonne National Lab., IL). Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

An extensive validation study of the ENDF/MC^2-2/SDX cell homogenization path has been made. The validation procedure has relied on the availability of rigorous Monte Carlo results obtained with the VIM code. The current study has investigated three ZPR benchmark assemblies with rather diverse characteristics. The calculations have included homogeneous zero-leakage cells, critically-buckled heterogeneous cells, and full as-built critical assemblies. This study has identified and eliminated several limitations and inconsistencies in these anlaytical methods and their application. The deterministic methods and Monte Carlo have been shown to agree very well (i.e., generally within 1 σ uncertainties) for zero-buckled homogeneous and heterogeneous cell calculations. For the high-buckling cases, ther was a bias on leakage-related parameters for both the homogeneous and heterogeneous cell calculations. This bias - less leakage with MC^2-2/SDC relative to VIM - was consistent with the results observed in the full assembly calculations. MC^2-2/SDX eigenvalues for the three ZPR assemblies were 0.5 to 0.7% σ k high relative to VIM. Principal cross sections and neutron spectrum in the full assembly calculations were in good agreement between these methods.

20440 **Corrosion-resistant fuel cladding allow for liquid metal fast breeder reactors.** Brehm, W.F.; Colburn, R.P. (to Dept. of Energy). US Patent 4,362,696. 7 Dec 1982. Filed date 21 May 1979. vp.

PAT-APPL-041273.

An aluminide coating for a fuel cladding tube for LMFBRS (liquid metal fast breeder reactors) such as those using liquid sodium as a heat transfer agent. The coating comprises a mixture of nickelaluminum intermetallic phases and presents good corrosion resistance to liquid sodium at temperatures up to 700° C while additionally presenting a barrier to outward diffusion of 54mn.

20441 **HEDL shielded materials facility remote examination of breeder reactor fuel pins.** Daubert, R.L.; Berger, J.D.; Weber, J.W. (Westinghouse Hanford Company, P.O. Box 1970, Richland, WA 99352). *Transactions of the American Nuclear Society;* **41**: 640-641(Jun 1982). (CONF-820609—).

From American Nuclear Society annual meeting; Los Angeles, CA, USA (6 Jun 1982).

20442 **Sensitivities and uncertainties of a large LMFBR using the adjusted cross-section library ORACLE-1.** Marable, J.H.; Biswas, D.; Cowan, C.L.; Kalifelz, J.M.; Weisbin, C.R.; White, J.R. (Oak Ridge National Laboratory, Oak Ridge, TN 37830). *Transactions of the American Nuclear Society;* **41**: 578-579(Jun 1982). (CONF-820609—).

From American Nuclear Society annual meeting; Los Angeles, CA, USA (6 Jun 1982).

20443 **LMFBR core design for low capital cost and low sodium void.** Fischer, G.J. (Brookhaven National Laboratory, Upton, NY 11973). *Transactions of the American Nuclear Society;* **41**: 136-137(Jun 1982). (CONF-820609—).

From American Nuclear Society annual meeting; Los Angeles, CA, USA (6 Jun 1982).

20444 **Examination of bimetallic Inconel 600/316 stainless steel sodium-heated steam generator.** DeVan, J.H.; Goodwin, G.M.; Leslie, B.C.; Slaughter, G.M. (Oak Ridge National Laboratory, Oak Ridge, TN 37830). *Transactions of the American Nuclear Society;* **41**: 299-300(Jun 1982). (CONF-820609—).

From American Nuclear Society annual meeting; Los Angeles, CA, USA (6 Jun 1982).

20445 **Combination pipe-rupture mitigator and in-vessel core catcher.** Tilbrook, R.W.; Markowski, F.J. US Patent A 6-356,569. 9 Mar 1982. 17p. Contract AC15-76CL02395.

A device is described which mitigates against the effects of a failed coolant loop in a nuclear reactor by restricting the outflow of coolant from the reactor through the failed loop and by retaining any particulated debris from a molten core which may result from coolant loss or other cause. The device reduces the reverse pressure drop through the failed loop by limiting the access of coolant in the reactor to the inlet of the failed loop. The device also spreads any particulated core debris over a large area to promote cooling.

2106 Power Reactors, Auxiliary, Mobile, Package, And Transportable

20446 (AD-A—115232/1) **Electron dose attenuation kernels for slab and spherical geometries. Final report.** Jordan, T.M. (Experimental and Mathematical Physics Consultants, Santa Monica, CA (USA)). Nov 1981. 120p. NTIS, PC A06/MF A01.

Dose attenuation kernels are given for fission spectrum electrons in aluminum shields with slab and spherical geometries. Sectoring methods used for satellites and space vehicles are discussed and several mathematical relationships are summarized. Dose attenuation data for monoenergetic electrons are presented for several shield materials and geometrics.

20447 (LA—9598-PR) **Space reactors. Progress report, October 1981-March 1982.** Ranken, W.A. (comp.). (Los Alamos National Lab., NM (USA)). Jan 1983. Contract W-7405-ENG-36. 79p. NTIS, PC A05/MF A01. Order Number DE83008278.

Progress in design studies and technology for the SP-100 Project - successor to the Space Power Advanced Reactor (SPAR) Project - is reported for the period October 1, 1981 to March 31, 1982. The basis for selecting a high-temperature, UO_2-fueled, heat-pipe-cooled reactor with a thermoelectric conversion system as the 100-kW/sub e/ reference design has been reviewed. Although no change has been made in the general concept, design studies have been done to investigate various reactor/conversion system coupling methods and core design modifications. Thermal and mechanical finite element modeling and three-dimensional Monte Carlo analysis of a core with individual finned fuel elements are reported. Studies of unrestrained fuel irradiation data are discussed that are relevant both to the core modeling work and to the design and fabrication of the first in-pile irradiation test, which is also reported. Work on lithium-filled core heat pipe development is described, including the attainment of 15.6 kW/sub t/ operation at 1525 K for a 2-m-long heat pipe with a 15.7-mm outside diameter. The successful operation of a 5.5-m-long, lightweight potassium/titanium heat pipe at 760 K is described, and test results of a thermoelectric module with GaP-modified SiGe thermoelectric elements are presented.

20448 (LA-UR—83-449) **Space nuclear power and man's extraterrestrial civilization.** Angelo, J.J.; Buden, D. (Los Alamos National Lab., NM (USA); Florida Inst. of Tech., Melbourne (USA)). 1983. Contract W-7405-ENG-36. 24p. (CONF-830421—1). NTIS, PC A02/MF A01. Order Number DE83007561.

From 20. space congress; Cocoa Beach, FL, USA (26 Apr 1983).

This paper examines leading space nuclear power technology candidates. Particular emphasis is given the heat-pipe reactor technology currently under development at the Los Alamos National Laboratory. This program is aimed at developing a 10-100 kWe, 7-year lifetime space nuclear power plant. As the demand for space-based power reaches megawatt levels, other nuclear reactor designs including: solid core, fluidized bed, and gaseous core, are considered.

2107 Regulation And Licensing

REFER ALSO TO CITATION(S) 20405, 20695, 20696

20449 **(CONF-820619—2) Importance of loss-of-benefits considerations in nuclear regulatory decision-making.** Buehring, W.A.; Peerenboom, J.P. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 13p. NTIS, PC A02/MF A01. Order Number DE83007613.

From 9. annual engineering conference on reliability; Hershey, PA, USA (16 Jun 1982).

This paper identifies and discusses some of the important consequences of nuclear power plant unavailability, and quantifies a number of technical measures of loss of benefits that may help the Nuclear Regulatory Commission make decisions involving nuclear power plant licensing and operation. The loss-of-benefits analysis presented here is based on the results of a series of case studies developed by Argonne National Laboratory in cooperation with four electric utilities on hypothetical nuclear plant shutdowns.

20450 **(NUREG—0020-Vol.6-No.10) Licensed operating reactors. Status summary report.** (Nuclear Regulatory Commission, Washington, DC (USA). Office of Resource Management). Oct 1982. 408p. NTIS, PC A18/MF A01 - GPO. Order Number DE83901522.

The US Nuclear Regulatory Commission's monthly LICENSED OPERATING REACTORS Status Summary Report provides data on the operation of nuclear units as timely and accurately as possible. This report is divided into three sections: the first contains monthly highlights and statistics for commercial operating units, and errata from previously reported data; the second is a compilation of detailed information on each unit, provided by NRC Regional Offices, IE Headquarters and the Utilities; and the third section is an appendix for miscellaneous information such as spent fuel storage capability, reactor years of experience and non-power reactors in the United States.

20451 **(NUREG—0304-V7-N1) Regulatory and technical reports: compilation for first quarter 1982, January-March.** Savolainen, A. (Nuclear Regulatory Commission, Washington, DC (USA)). May 1982. 144p. NTIS, PC A07/MF A01.

This compilation consists of bibliographic data and abstracts for the formal regulatory and technical reports issued by the U.S. Nuclear Regulatory Commission (NRC) Staff and its contractors. It is NRC's intention to publish this compilation quarterly and to cumulate it annually.

20452 **(NUREG—0485-Vol.5-No.1) Systematic evaluation program. Status summary report.** (Nuclear Regulatory Commission, Washington, DC (USA). Office of Resource Management). 31 Jan 1983. 64p. NTIS, PC A04/MF A01 - GPO. Order Number DE83901535.

Status summaries concerning legal aspects of the reactors are presented for Dresden-1 reactor, Dresden-2 reactor, Big Rock Point reactor, Ginna-1 reactor, Connecticut Yankee reactor, LACBWR reactor, Millstone-1 reactor, Oyster Creek-1 reactor, Palisades-1 reactor, San Onofore-1 reactor, and Rowe Yankee reactor.

20453 **(NUREG—0540-N2) Title list of documents made publicly available: documents from October through December 1978 for Dockets 50-334 through STN 50-597.** (Nuclear Regulatory Commission, Washington, DC (USA)). Jun 1982. 406p. NTIS, PC A18/MF A01.

This document contains a description of information received and generated by the U.S. NRC. This special edition contains Docket 50 material from 1978 that has not appeared in previous editions of the Title List. The documents in this supplement are indexed by personal author, corporate source, and report number.

20454 **(NUREG—0540-Vol.4-No.11) Title list of documents made publicly available.** (Nuclear Regulatory Commission, Washington, DC (USA). Office of Administration). Feb 1983. 669p. NTIS, PC A99/MF A01 - GPO. Order Number DE83901541.

The Title List of Documents Made Publicly Available is a monthly publication. It contains descriptions of the information received and generated by the US Nuclear Regulatory Commission (NRC). This information includes (1) docketed material associated with civilian nuclear power plants and other uses of radioactive materials and (2) nondocketed material received and generated by NRC pertinent to its role as a regulatory agency. As used here, docketed does not refer to Court dockets; it refers to the system by which NRC maintains its regulatory records. This series of documents is indexed by a Personal Author Index, a Corporate Source Index, and a Report Number Index.

20455 **(NUREG—0566-Vol.2-No.4) Standards development status summary report. Quarterly report covering two periods July-December 1982.** (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Regulatory Research). 1982. 1982p. NTIS, PC A09/MF A01 - GPO. Order Number DE83901520.

This report gives in summary form, the current schedule plans for development of regulations, guides, reports, petitions and environmental statements. Approved schedules are identified by a T (target) date below each milestone description on the computerized network. Schedule estimates that have not yet been approved by res management are also included and are identified by an E (estimate) dated below the approved target date. E dates do not represent approved changes and are printed for information purposes only.

20456 **(NUREG—0748-V2-N3) Operating reactors licensing actions summary.** (Nuclear Regulatory Commission, Washington, DC (USA). Office of Management and Program Analysis). Apr 1982. 368p. NTIS, PC A16/MF A01.

The Operating Reactors Licensing Actions Summary is designed to provide the management of the Nuclear Regulatory Commission (NRC) with an overview of licensing actions dealing with operating power and nonpower reactors.

20457 **(NUREG—0748-Vol.2-No.12) Operating reactors licensing actions summary.** (Nuclear Regulatory Commission, Washington, DC (USA). Office of Resource Management). Jan 1983. 290p. NTIS, PC A13/MF A01 - GPO. Order Number DE83901271.

The operating reactors licensing actions summary is designed to provide the management of the Nuclear Regulatory Commission (NRC) with an overview of licensing actions dealing with operating power and nonpower reactors. These reports utilize data collected from the Division of Licensing in the Office of Nuclear Reactor Regulation and are prepared by the Office of Management and Program Analysis. This summary report is published primarily for internal NRC use in managing the operating reactors licensing actions program. Its content will change based on NRC management informational requirements.

20458 **(NUREG—0748-Vol.3-No.1) Operating reactors licensing actions summary.** (Nuclear Regulatory Commission, Washington, DC (USA). Office of Resource Management). Feb 1983. 293p. NTIS, PC A13/MF A01 - GPO. Order Number DE83901513.

The operating reactors licensing actions summary is designed to provide the management of the Nuclear Regulatory Commission (NRC) with an overview of licensing actions dealing with operating power and nonpower reactors. These reports utilize data collected from the division of licensing in the Office of Nuclear Reactor Regulation and are prepared by the Office of Management and Program Analysis. This summary report is published primarily for internal NRC use in managing the operating reactors licensing actions program. Its content will change based on NRC management informational requirements.

20459 (NUREG—0750-V14-IND-1) **Indexes to Nuclear Regulatory Commission Issuances, July-September 1981.** (Nuclear Regulatory Commission, Washington, DC (USA)). 1981. 65p. NTIS, PC A04/MF A01.

Digests and indexes for issuances of the Commission (CLI), the Atomic Safety and Licensing Appeal Panel (ALAB), the Atomic Safety and Licensing Board Panel (LBP), the Administrative Law Judge (ALJ), the Directors' Decisions (DD), and the Denials of Petitions of Rulemaking are presented in this document. These digests and indexes are intended to serve as a guide to the issuances.

20460 (NUREG—0750-V15-N1) **Nuclear Regulatory Commission Issuances, January 1982.** (Nuclear Regulatory Commission, Washington, DC (USA)). 1982. 234p. NTIS, PC A11/MF A01.

This report includes the issuances received during the specified period from the Commission (CLI), the Atomic Safety and Licensing Appeal Boards (ALAB), the Atomic Safety and Licensing Boards (LBP), the Administrative Law Judge (ALJ), the Director's Decisions (DD), and the Denials of Petitions for Rulemaking (DPRM).

20461 (NUREG—0750-V15-N2) **Nuclear Regulatory Commission Issuances, February 1982.** (Nuclear Regulatory Commission, Washington, DC (USA)). 1982. 143p. NTIS, PC A07/MF A01.

This report includes the issuances received during the specified period from the Commission (CLI), the Atomic Safety and Licensing Appeal Boards (ALAB), the Atomic Safety and Licensing Boards (LBP), the Administrative Law Judge (ALJ), the Directors' Decisions (DD), and the Denials of Petitions for Rulemaking (DPRM).

20462 (NUREG—0849) **Standard review plan for the review and evaluation of emergency plans for research and test reactors. Technical report.** Bates, E.F.; Grimes, B.K.; Ramos, S.L. (Nuclear Regulatory Commission, Washington, DC (USA). Office of Inspection and Enforcement). May 1982. 36p. NTIS, PC A03/MF A01.

This document provides a Standard Review Plan for the guidance of the NRC staff to assure that complete and uniform reviews are made of research and test reactor emergency plans. The report is organized under ten planning standards which correspond to the guidance criteria in Draft II of ANSI/ANS 15.16 as endorsed by Revision 1 to Regulatory Guide 2.6. The applicability of the items under each planning standard is indicated by subdivisions of the steady state thermal power levels at which the reactors are licensed to operate. Standard emergency classes and example action levels for research and test reactors which should initiate these classes are given in an Appendix.

20463 (NUREG/CR—2000-Vol.2-No.1) **Licensee Event Report (LER) compilation for month of January 1983.** (Oak Ridge National Lab., TN (USA)). Feb 1983. Contract W-7405-ENG-26. 116p. (ORNL/NSIC—200-Vol.2-No.1). NTIS, PC A06/MF A01 - GPO. Order Number DE83007893.

This monthly report contains Licensee Event Report (LER) operational information that was processed into the LER data file of the Nuclear Safety Information Center (NSIC) during the one month period identified on the cover of the document. The LERs, from which this information is derived, are submitted to the Nuclear Regulatory Commission (NRC) by nuclear power plant licensees in accordance with federal regulations. Procedures for LER reporting are described in detail in NRC Regulatory Guide 1.16 and NUREG-0161, Instructions for Preparation of Data Entry Sheets for Licensee Event Reports. The LER summaries in this report are arranged alphabetically by facility name and then chronologically by event date for each facility. Component, system, and keyword indexes follow the summaries.

20464 (ORNL/SUB—7846/4) **Study of a conceptual nuclear energy center at Green River, Utah: institutional and licensing issues.** Heilman, C.B.; Herman, A.A. Jr.; Vito, D.J. (Gilbert Associates, Inc., Reading, PA (USA)). Apr 1982. Contract W-7405-ENG-26. 85p. (GAI—05-1155-000). NTIS, PC A05/MF A01. Order Number DE83006837.

This document constitutes a segment of a feasibility study investigating the ramification of construcing a nuclear energy center in an arid western region. In this phase of the study, the institutional and licensing issues impacting a NEC were analyzed. The most prominent issue facing such a concept is the ownership form of NEC. In addition, legislation and regulation also have a substantial impact regardless of the ownership format.

2108 Economics

REFER ALSO TO CITATION(S) 20410, 20817

20465 (AD-A—118807/7) **Uncertainty in estimating power-plant closure costs: A review of 'Economic impact of closing Zion nuclear facility,' a report by the Comptroller General of the United States.** Stucker, J.P. (RAND Corp., Santa Monica, CA (USA)). Mar 1982. 43p. NTIS, PC A03/MF A01.

Comparing GAO's estimates of the costs that could result from the closure of Zion and Indian Point reveals the large range of uncertainty currently associated with such estimates and suggests a number of areas requiring further study. Better and more detailed information on alternative generating costs, decommissioning costs, incremental financing costs, and secondary costs in general needs to be developed and documented. And the groups or institutions who will ultimately bear these costs need to be identified. Uncertainties in all these areas must be reduced, and common costing methods and assumptions adopted, before intelligent decisions can be made regarding the future of any of the nuclear generating facilities (either operational or under construction) that are currently being questioned.

20466 (ANL/NESC—146) **NPRFCCP; fuel cycle costs performance data.** Tyson, F.D. (United Engineers and Constructors, Philadelphia, PA (USA). Technical Computer Services). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048146.

Nuclear fuel cycle costs in dollars per year ($/yr), and in mills per kilowatt-hour (mills/kwhr) are computed and tabulated for each region of a multiregion reactor core, on the basis of AEC-leased nuclear fuel material and of privately-owned nuclear fuel material. Fuel cycle costs are computed separately for each region or zone, for core designs of any configuration or combination of material depletion or enriched uranium fuel or other special nuclear material. Printed output of the program includes (a) detailed fuel cycle costs for each zone in tabular form, for AEC-leased and privately-owned nuclear fuel material, respectively, (b) a summary tabulation of nuclear fuel costs for all regions of the complete core, including fixed charges on working capital required for core fabrication and for nuclear fuel material, (c) a summary tabulation of certain computed performance and economic data, viz., average residence time, annual fuel throughput, unit electrical energy yield, annual power generation, and core fabrication costs, and (d) a tabulation of all input data for all regions. The printing of data described in (a) and (d) above is optional with program use.CDC6600;IBM360,370/195; FORTRAN IV; SCOPE 3.3 (CDC6600), OS/360,370 (IBM360,370).

20467 (ANL/NESC—221) **RELOAD FEVER; one-dimensional, few-group diffusion depletion.** Wang, C.L. (Institute of Nuclear Energy Research, Lung-Tan (Taiwan)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048221.

Maxima of - 4 energy groups 100 mesh points 20 diffusion regions 32 subregions 35 nuclides per subregion 60 cross section sets; Source deck (4724 cards) Sample problem (231 cards) Sample problem output (46 selected pages, complete on 1 microfiche) Reference report, GA-6612.

RELOAD FEVER performs a few-group, one-dimensional depletion calculation which allows fuel in various stages of irradiation to be homogenized into the same region for purposes of the diffusion calculation but follows the depletion of each of the subregions separately. The calculation may be interrupted periodically for refueling one or more regions. Recycling is optional, and an unlimited number of refuelings may be performed. A control poison search is available, and concentration-dependent self-shielding factors may be applied to one lumped poison.CDC CYBER73,175; FORTRAN IV; NOS/BE 1.2, 1.3; 67,000 (octal) words of memory are required for execution.

20468 (ANL/NESC—224) **WAMPUM; fuel cycle costs performance study.** Tyson, F.D. (United Engineers and Constructors, Philadelphia, PA (USA). Technical Computer Services). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048224.

This program calculates fuel cycle costs on a detailed basis, using results of nuclear depletion calculations and certain specified economics assumptions. The purpose is to provide a measure of performance for comparing or optimizing fuel cycles and associated reactor core and fuel element characteristics.CDC6600; FORTRAN IV; SCOPE 3.3.

20469 (ANL/NESC—226) **OPUS; power plant performance and price study.** Gratteau, J.E. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048226.

Power levels from 100 to 1000 megawatts are acceptable. A maximum of 100 turbogenerator arrangements can be included. Systems up to 100 nodes leading to no more than 749 equations can be studied .

The code generates a flow network equivalent to a gas-cooled nuclear power plant of specified electrical output (in the range of 100 to 1000 MW) according to input data and programmed rules, proceeds to evaluate the plant performance and price of the turbogenerator set (according to General Electric price data), and prints as a result a coded list of all plant components and a detailed performance map.UNIVAC1108; FORTRAN IV; EXEC2; 32K machine with 5 tapes besides input and output tapes.

20470 (ANL/NESC—302) **GAFFE; equilibrium fuel cycle calculation.** Jaye, S. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048302.

Maxima of - 18 energy groups 50 total nuclides 3 nuclides with full transfer matrix.

A zero-dimensional calculation of feed fuel requirements is performed to produce a specified end of cycle multiplication factor for the equilibrium fuel cycle, given feed composition, length of cycle and reactor power. It is alternately possible to compute cycle length or feed enrichment. The code is a survey tool which assumes periodic refueling and permits complete or partial recycling of materials. The segregated fuel concept can be handled within the framework of the calculation.UNIVAC1108; FORTRAN IV; EXEC2, GAX27; 65K memory and 2 tapes (I/O).

20471 (ANL/NESC—340) **POWERCO; nuclear station electricity costs.** Tyson, F.D. (United Engineers and Constructors, Philadelphia, PA (USA). Technical Computer Services). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048340.

Maximum of - 180 time periods.

POWERCO calculates the cost of electricity produced by nuclear power stations, assuming all cash expenses such as investment and fuel costs, operating expenses, and taxes are known. The power cost is held constant throughout the project life.CDC6600; FORTRAN IV; SCOPE 3.3.

20472 (ANL/NESC—354) **CINCAS; nuclear fuel cycle cost and economics.** McLain, S.; Fulford, P.J. (Purdue Univ., Lafayette, IN (USA); Michigan Univ., Ann Arbor (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048354.

Government ownership or leasing of fuel is not allowed, and Th233 fuels are not covered, nor has consideration been given to breeder reactors. The in-core time spanned by all batches of a case must be no more than 40 years.

CINCAS is a nuclear fuel cycle cost code which may be used for either engineering economy predictions of fuel cycle costs or for accounting forecasting of such costs. Features of CINCAS include - (1) monthly calculation of dollar costs and mass inventory on a batch and case basis for each month of a period which is usually defined as (but not restricted to) beginning with the delivery of fuel to the reactor site and ending with the withdrawal of fuel from the reactor. (2) a general formula for the unit price of enriched uranium which allows for variable feed and tails enrichments, costs of feed, chemical conversion, separative work, and losses in conversion and fabrication.IBM360;CDC6600; FORTRAN IV; OS/360 and SCOPE.

20473 (ANL/NESC—441) **PWCOST; reactor fuel cycle cost calculation.** Lee, D.H. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048441.

Maxima of - 24 core regions 100 segments 2 fuel particle types 100 reloads before equilibrium is established 100 times for core reload.

PWCOST is used to calculate nuclear reactor fuel cycle costs. Input for all components of the fuel cycle are time-dependent. Working capital charge rates may be specified separately for in-core and out-of-core time periods.UNIVAC1108; FORTRAN IV; EXEC2; 65K core and 1 tape.

20474 (ANL/NESC—498) **CONCEPT5;CONCEPT3; power plant conceptual cost estimate.** Hudson, C.R.II; Bowers, H.I. (Oak Ridge National Lab., TN (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048498.

The CONCEPT computer code system was developed to provide conceptual capital cost estimates for nuclear-fueled and fossil-fired power plants. Cost estimates can be made as a function of plant type, size, location, and date of initial operation. The output includes a detailed breakdown of the estimate into direct and indirect costs similar to the accounting system described in document NUS-531. Cost models are provided in CONCEPT5, the fifth generation in the development of the CONCEPT package, for single- and multi-unit pressurized water reactors, boiling water reactors, and coal-fired plants with and without flue gas desulfurization equipment. The CONCEPT5 models are updated models of those available in CONCEPT3 and, in addition, this edition contains historical factory equipment cost data for the generation of cost indices and escalation rates; indirect costs are calculated as a function of unit size rather than a function of direct costs; and an indirect cost account for owner's costs and an improved time-dependent escalation feature are included. The CONCEPT3 models and cost data are outdated; the package is being retained in the library since it is the only UNIVAC1108 machine version of CONCEPT available and could prove helpful in converting the latest IBM release.IBM360,370;UNIVAC1108; FORTRAN IV (H) (98%) and Assembly language (2%) (IBM360); FORTRAN IV (UNIVAC1108); OS/360 (IBM360) and EXEC8 (UNIVAC1108); Less than 270K bytes, four scratch files, two support files, and the standard I/O units are required for CONCEPT5; 150K bytes, one scratch disk or tape, two support tapes, and the standard I/O units are needed for CONCEPT3.

20475 **(ANL/NESC—540) PACTOLUS;CLOTHO; nuclear power plant cost code.** Haffner, D.R. (Hanford Engineering Development Lab., Richland, WA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048540.

Maxima of - 40 annual time periods into which all costs and mass flows are accumulated 20 isotopic mass flows charged into and discharged from the reactor model.

PACTOLUS is a code for computing nuclear power costs using the discounted cash flow method. The cash flows are generated from input unit costs, time schedules and burnup data. CLOTHO calculates and communicates to PACTOLUS mass flow data to match a specified load factor history.UNIVAC1108; FORTRAN V; CSCX; 65K memory with drum storage of input data to speed up processing.

20476 **(ANL/NESC—855) REFCO8; discounted cash flow fuel cycle cost.** Salmon, R. (Oak Ridge National Lab., TN (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048855.

REFCO8 is designed to calculate nuclear fuel cycle cost by the discounted cash flow method for any given capital structure and interest rates. REFCO uses continuous discounting so that each expenditure or income is discounted from the time of occurrence, and fuel cycle costs are calculated for each batch of fuel both individually and cumulatively through each batch. Tax deductible fuel expense can be calculated on a batchwise basis in keeping with industry practice. REFCO8 also has provision for parametic studies of the effect of price escalation, and can be used to calculate the equilibrium fuel cycle cost of a reactor by supplying input data for a single equilibrium batch.IBM360,370; FORTRAN IV; OS/360 (IBM360), OS/370 (IBM370); The program requires approximately 155K bytes of memory for execution.

20477 **(CONF-8208117—1) Loss of benefits resulting from mandated nuclear plant shutdowns.** Peerenboom, J.P.; Buehring, W.A. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 20p. NTIS, PC A02/MF A01. Order Number DE83007737.

From Conference on generation planning: modeling and decisionmaking; Chattanooga, TN, USA (10 Aug 1982).

This paper identifies and discusses some of the important consequences of nuclear power plant unavailability, and quantifies a number of technical measures of loss of benefits that result from regulatory actions such as licensing delays and mandated nuclear plant outages. The loss of benefits that accompany such regulatory actions include increased costs of systems generation, increased demand for nonnuclear and often scarce fuels, and reduced system reliability. This paper is based on a series of case studies, supplemented by sensitivity studies, on hypothetical nuclear plant shutdowns. These studies were developed by Argonne in cooperation with four electric utilities.

20478 **(NUREG/CR—2704) U.S. reactor spent-fuel storage capabilities. Technical report.** Lee, W.J.; Hoffman, C.C.; Caviness, C.K. (Nuclear Assurance Corp., Atlanta, GA (USA)). Jun 1982. 76p. NTIS, PC A05/MF A01.

This report describes the spent-fuel storage situation at reactors in the United States. The focus of the report is on the reactors that are developing a spent-fuel storage problem and the alternatives the utilities are utilizing and planning to use to minimize the problem. The alternatives the utilities are using and/or considering are described in the report and include: High-density storage racks; Double-tiered storage racks; Rod consolidation; Dry storage systems; Fuel transshipments; and At-reactor storage pools. All of these alternatives are not available to every reactor and utility that is faced with a spent-fuel storage problem. Generally, utilities are reracking or are planning to rerack those spent-fuel pools that can be reracked with higher-density racks or double-tiered racks. Where reracking is not feasible, then fuel transshipments are being performed or considered. Since none of these other alternatives have been fully approved and licensed, these alternatives are all being evaluated.

2109 Process Heat Reactors

REFER ALSO TO CITATION(S) 20395, 20397, 20400, 20688

20479 **(BGI/GCRA—83-001) Monolithic HTGR - reformer design and cost summary: thermochemical pipeline application.** (Bechtel Group, Inc., San Francisco, CA (USA)). Dec 1982. Contract AC03-78SF02034. 59p. NTIS, PC A04/MF A01. Order Number DE83007130.

This summary report updates conceptual designs and cost estimates for monolithic High Temperature Gas-Cooled Reactor (HTGR) plants used as a source of process heat. The GFY 82 studies summarized in this report address design improvements and cost reductions for High Temperature Process Heat Systems selected in GFY 81. The GFY 81 studies consisted primarily of evaluating various configurations for a single (monolithic) HTGR rated at 1170 MWt used as part of a Thermochemical Pipeline (TCP) System. In the TCP concept, a helium-heated reformer produces syngas which can be transported up to 100 miles via pipeline to a methanation plant, where it is converted to methane. This exothermic process generates high-temperature steam for nearby process steam users. The methane is then returned to the nuclear plant site for conversion to syngas in the reformers. The work performed in GFY 82 on the monolithic HTGR-R plants is described. The results of the cost improvement studies are reviewed. A cost evaluation of the HTGR-R plants incorporating the GFY 82 changes is included. Recommendations for follow-on work on the HTGR-R monolithic plants are provided.

20480 **(BGI/GCRA—83-002) Modular HTGR systems design and cost summary.** (Bechtel Group, Inc., San Francisco, CA (USA)). Dec 1982. Contract AC03-78SF02034. 104p. NTIS, PC A06/MF A01. Order Number DE83007137.

This summary report describes conceptual designs and cost estimates for High Temperature Gas-Cooled Reactor (HTGR) plants based on the modular reactor concept as a source of process steam. Studies suggest that a modular reactor system (MRS) composed of a number of small, standardized, HTGR modules (which collectively meet the process heat users' requirements) might have some advantages relative to a single, large (monolithic) HTGR designed for the same capacity. This summarizes the designs of these MRS systems. The overall plant descriptions, arrangements, and layouts of the MRS-R and MRS-SC/C concepts are summarized. This inlcudes descriptions of the reactor core design and internals, major components, and balance of plant (BOP) design. Initial availability estimates as well as licensing and safety assessments of these MRS concepts are presented. Estimates of the plant capital, fuel cycle, operating and maintenance costs, and construction schedule are summarized. The technical issues which need be addressed for the development of the MRS concepts are highlighted. A discussion of the anticipated follow-on effort to these studies is presented.

20481 **(DOE/SF/02034—T81) FY1983 HTGR summary level program plan.** (Gas-Cooled Reactor Associates, La Jolla, CA (USA)). 1 Feb 1983. Contract AC03-78SF02034. 105p. NTIS, PC A06/MF A01. Order Number DE83007138.

The major focus and priority of the FY1983 HTGR Program is the development of the HTGR-SC/C Lead Project through one of the candidate lead utilities. Accordingly, high priority will be given to work described in WBS 04 for site and user specific studies toward the development of the Lead Project. Asessment of advanced HTGR systems will continue during FY1983 in accordance with the High Temperature Process Heat (HTPH) Concept Evaluation Plan. Within the context of that plan, the assessment of the monolithic HTPH concepts has been essentially completed in FY1982 and FY1983 activities and will be limited to documentation only. the major advanced HTGR systems efforts in FY1983 will be focused on the further definition of the Modular Reactor Systems concepts in both the reforming (MRS-R) and

Steam Cycle/Cogeneration 9MRS-SC/C) configurations in WBS 41. The effort will concentrate upon key technical issues and trade studies oriented to reduction in expected cost and schedule duration. With regard to the latter, the most significant will be trade study addressing the degree of modularization of reactor plant structures. particular attention will be given to the confinement building which currently defines the critical path for construction.

20482 **(GA/PC—000007) HTGR steam-cycle/cogeneration technology development plan for Nuclear Steam Supply System. Volume III. Technology development plan.** (General Atomic Co., San Diego, CA (USA)). Jul 1982. Contract AT03-76ET35300;AT03-76ET35301. 418p. NTIS, PC A18/MF A01. Order Number DE83008103.

The program described in this document includes all work currently foreseen by the program participants as needed to provide the basic technology and design data required on a priority basis to complete and verify the design of the HTGT - steam cycle/cogeneration (SC/C) plant operating on the low-enriched uranium/thorium (LEU/Th) cycle in a time frame consistent with specific HTGR plant applications. The program includes fuel materials and fuel process development, all nuclear steam supply system (NSSS) component testing and design verification, plant technology development, materials design data development, and technology transfer from other programs required to support the design of the nuclear heat source (NHS)

20483 **(GA/PC—000008) HTGR Steam Cycle/Cogeneration Design Development Plan for Nuclear Steam Supply System. Volume II. Design development plan.** (General Atomic Co., San Diego, CA (USA)). Jul 1982. Contract AT03-76SF70046. 377p. NTIS, PC A17/MF A01. Order Number DE83008102.

The Design Development Program plan described in this document is a part of the overall program being undertaken by the Department of Energy (DOE), utilities, and industry to realize national benefits from the deployment of the high-temperature gas-cooled reactor (HTGR) utilized as the nuclear steam supply system (NSSS) for a 2240-MW(t) HTGR - steam cycle/cogeneration (HTGR-SC/C) plant. This document covers the work associated with the design of the NSSS of the HTGR-SC/C. Information is presented concerning the work breakdown structure, document tree, and design phase definitions used by GA in defining and breaking down the work to be accomplished; the constraints and assumptions which are the basis for this plan; the priority technical issues associated with the HTGR-SC/C and the plan for resolving these issues; the design data needs (DDN's) which serve as the link between the Design Development Program plan and the Technology Development Program plan; the design work to be accomplished to bring the HTGR-SC/C to reality; the project management and support effort required to plan, organize, direct, and control the program; and the program costs and schedules.

20484 **(GA/PC—000040) HTGR steam-cycle/cogeneration lead plant design and cost report. Volume II. Nuclear Steam Supply System.** (General Atomic Co., San Diego, CA (USA)). Jul 1982. Contract AC03-78SF02034. 308p. NTIS, PC A14/MF A01. Order Number DE83008100.

This document is Volume II of the three-volume HTGR-SC/C Design and Cost Report, which is, in turn, a part of the Lead Plant Project Decision Package. Itprovides a design description and estimated cost of the nuclear steam supply system (NSSS) for the 2240-MW(t) high-temperature gas-cooled reactor steam cycle/cogeneration (HTGR-SC/C plant. The NSSS is designed to supply high-temperature, high-pressure steam for cogeneration of electric power and process plant usage. It encompasses the reactor heat source, the primary and auxil;iary heat removal systems, the steam generation portion of the secondary coolant system, and related controls, instrumentation, and support equipment.

20485 **(GCRA—82-010-Vol.1) High-temperature gas-cooled reactor steam-cycle/cogeneration lead plant design and cost report. Volume I: summary.** (Gas-Cooled Reactor Associates, La Jolla, CA (USA)). Jul 1982. Contract AC03-78SF02034. 95p. NTIS, PC A05/MF A01. Order Number DE83008021.

Two Lead Plant options have been developed that use a 2240 MWt HTGR Nuclear Steam Supply System: an electric generation plant that produces a net output of 855 MWe, and a cogeneration plant that produces a variable output of process steam and electricity. This document is Volume I of the Lead Plant Design and Cost Report which prvides the current design and cost status of the 2240 MWt high temperature gas-cooled reactor steam cycle/cogeneration (HTGR-SC/C) Lead Plant. A summary status is presented for the Lead Plant conceptual design and costs. The two Lead Plant options are described. A summary of the engineering, capital and operating costs is presented. The costs for an equilibrium plant (nth plant-of-a-kind) of the same configuration as the Lead Plant are also given. The HTGR-SC/C plant costs are then compared with costs for equivalent sized PWR and coal plants. The PWR and coal plant costs were developed using the same basis and methods as used for the HTGR-SC/C estimates. The Lead Plant design and construction schedules are summarized.

20486 **(GCRA—82-011) High-temperature gas-cooled reactor steam cycle/cogeneration. Design and technology development plan for Nuclear Steam Supply System. Volume I: Summary.** (Gas-Cooled Reactor Associates, La Jolla, CA (USA)). Jul 1982. Contract AC03-78SF02034. 97p. NTIS, PC A05/MF A01. Order Number DE83008101.

The HTGR-SC/C Lead Project is proposed as a joint Industry/Government venture for the development and construction of an HTGR-SC/C Lead Plant. The Design and Technology Development Plan is presented in three volumes of which this document is Volume I, Summary. Section 2 of this document presents the basis for the remaining development work in terms of the evolution in requirements imposed by the User, Regulator and Vendor institutions since the Fort St. Vrain demonstration plant was committed. Development costs amounting to an estimated $483M are discussed in context with the effort to: design and document the NSSS of a commercial HTGR-SC/C system; verify component and system performance through hardware tests; and extend the base of technology for fuel, materials and analytical methods to establish industry capability and standards to design the system. Section 3 summarizes the detailed requirements, workscope, cost and schedule information in Volume II, The Design Development Plan; and in Volume III, The Technology Development Plan.

20487 **(GCRA—82-012) High Temperature Gas-Cooled Reactor Steam Cycle/Cogeneration Lead Project Decision Package: executive summary.** (Gas-Cooled Reactor Associates, La Jolla, CA (USA)). Jul 1982. Contract AC03-78SF02034. 24p. NTIS, PC A02/MF A01. Order Number DE83008104.

The Lead Project Decision Package is a series of documents that support the bases for a 2240 MW(t) High-Temperature Gas-Cooled Reactor Steam Cycle/Cogeneration (HTGR-SC/C) Lead Project. In particular, the Design and Cost Report and the Design and Technology Development Plan constitute the technical and economic data base for such a Project. As such, the information contained in these documents represents the collective views and efforts of the HTGR Program participants that has been developed primarily through contracts with the Department of Energy. The Lead Project Strategy Plan was prepared by Gas-Cooled Reactor Associates with cooperation from the industrial Program Participants as a proposed strategy for deploying such a Project, including proposed cost and risk sharing arrangements between the private and public sectors. The objective of the Lead Project Decision Package is to establish a framework and data base for the considerations of and the negotiations between the prospective participants in the Land Project.

20488 **(GCRA—82-014) High-temperature gas-cooled reactor steam-cycle/cogeneration lead project: national incentives.** (Gas-Cooled Reactor Associates, La Jolla, CA (USA)). Jul 1982. Contract AC03-78SF02034. 15p. NTIS, PC A02/MF A01. Order Number DE83007986.

In order to secure the HTGR as a commercial option, a National Program is required that is based on equitable cost and risk sharing arrangements between the private and public sectors and focused on a specific project. Through a comprehensive evaluation of project candidates, the four-loop, 2240 MW(t) HTGR-Steam Cycle/Cogeneration (SC/C) system has been established as the primary candidate as a Lead Project. This document reviews the National Incentives as posed by the Utility/User industry through Gas-Cooled Reactor Associates (GCRA) for commercializing the HTGR through the Steam Cycle/Cogeneration Lead Project. Following this introduction, subsequent brief summaries will review: HTGR features and evolution potential; US energy growth trends and implications; cogeneration opportunities and economics; safety and investment protection; environment, operations and maintenance considerations; and fuel cycle considerations.

20489 (GCRA—82-015) Industrial process-heat market assessment: an update. (Gas-Cooled Reactor Associates, La Jolla, CA (USA)). Sep 1982. Contract AC03-78SF02034. 148p. NTIS, PC A07/MF A01. Order Number DE83007993.

This report is designed to be a reference resource and is an update of the report, same subject, issued by GCRA in December 1981. It gives a broad perspective of the potential HTGR market for industrial process heat and is intended to serve as a briefing document for those wishing to obtain background information or to serve as a starting point from which more detailed and refined studies may be undertaken. This report presents a qualitative and quantitative description of the industrial process heat market in the US, provides a summary discussion of cogeneration experience to date, and outlines the existing institutional and financial framework for cogeneration. The report presents the latest developments in regulatory and legislative activities which are associated with that technology. Finally, the report presents a brief discussion of an advanced process heat distribution system, coupled with an HTGR configuration which has been under study during the current fiscal year by one of the program participants.

20490 (GCRA/UEC—82-010) High-temperature gas-cooled reactor steam-cycle/cogeneration, lead plant design and cost report. Volume III. Balance of plant. (United Engineers and Constructors, Inc., Philadelphia, PA (USA)). Jul 1982. Contract AC03-78SF02034. 665p. NTIS, PC A99/MF A01. Order Number DE83008265.

The purpose of this volume is to describe the balance of plant (BOP) design, cost and schedule for the 2240 MW(t) HTGR-SC/C Cogeneration and Electric Generation Plants. Summary plant descriptions for the cogeneration and electrical plants are provided. The differences between the two plants are discussed. The capital costs and engineering and construction milestone schedules respectively for both the lead or first-of-a-kind and the equilibrium or Nth-of-a-kind plants are described. A presentation of the assumptions and basis for these costs and schedules is included. Costs for comparable PWR and coal plants are provided for comparison with the HTGR costs.

22 NUCLEAR REACTOR TECHNOLOGY

2201 Theory And Calculation

20491 (ANL/NESC—43R) CURFIT; curve fitting experimental data points. Warrington, J.A. (Knolls Atomic Power Lab., Schenectady, NY (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048043.

CURFIT is a composite program for fitting experimental data points with different types of common analytic curves. There are at present five fits available: (1) polynomial y = summation over i of a(i)*(x**(i)) (2) exponential y = a*exp(bx) (3) cosine y = a*cos(b(x+c)) (4) series of cubics y = a(j)+b(j)*x+c(j)*(x**2)+d(j)*(x**3) (5) Fourier seriesCDC6600; FORTRAN IV and ASCENT; SCOPE 2.0.

20492 (ANL/NESC—121) AIREK3; space-independent kinetics with feedback. Grosskopf, O.G.P. (South African Atomic Energy Board, Pretoria). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048121.

AIREK3 finds the numerical solution to the space-independent reactor kinetics equations based on the method developed by E. R. Cohen. Input and output are simplified and the power, inverse period, feedbacks, and precursors are displayed graphically.IBM360; FORTRAN IV; OS/360.

20493 (ANL/NESC—136) HERESY3; two-dimensional heterogeneous reactor calculation. Finch, D.R. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048136.

Maxima of - 50 flux/geometry symmetry positions 20 physically different assemblies 9 resonance levels 5000 rod coordinate positions.

HERESY3 solves the two-dimensional, few-group, static reactor eigenvalue problem using the heterogeneous (source-sink or Feinburg-Galanin) formalism. The solution yields the reactor k-effective and absorption reaction rates for each rod normalized to the most absorptive rod in the thermal level. Epithermal fissions are allowed at each resonance level, and lattice-averaged values of thermal utilization, resonance escape probability, thermal and resonance eta values, and the fast fission factor are calculated. Kernels in the calculation are based on age-diffusion theory. Both finite reactor lattices and infinitely repeating reactor supercells may be calculated. Rod parameters may be calculated by several internal options, and a direct interface is provided to a HAMMER system (NESC Abstract 277) lattice library tape to obtain cell parameters. Criticality searches are provided on thermal utilization, thermal eta, and axial leakage buckling.IBM360; FORTRAN IV and BAL; OS/360; 45K single-precision words of high speed core plus 50K single-precision words of disk (or drum) storage.

20494 (ANL/NESC—167) FLARE; three-dimensional reactivity and power distribution. Delp, D.L Fisher, D.L. (General Electric Co., San Jose, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048167.

Because of the independent representation of the control rods, a three-dimensional calculational scheme was employed. This three-dimensional geometry combined with computer size limitations restricted the calculations to a relatively coarse mesh. The present version of the code will handle a maximum array of 14 x 14 x 12 nodes with either mirror or diagonal symmetry .

FLARE is an inexpensive calculational method to determine core reactivity and core power distribution. A scoping calculation of this type is valuable in appraising the physics characteristics of planned test modes of operation so that detailed analysis can be reserved for those core calculations of greater interest from either a technician or safety standpoint.GE635;IBM360;CDC7600; FORTRAN IV; GECOS (GE635), OS/360 (IBM360), and SCOPE (CDC7600); 39K and 3 tapes in addition to the system units are used on the GE635, 400K and 5 tapes or disks are required on the IBM360. 80,000 (octal) words of small core memory and 12,000 (octal) words of large core memory are needed for the CDC7600 version.

20495 (ANL/NESC—168) INVERSE KINETICS;r102; space-independent inverse kinetics calculations. Kaganove, J.J. (Argonne National Lab., IL (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048168.

Maxima of - 50 delay groups 1000 data points 99 data blocks (A data block is a sequence of input points characterized by a fixed time-interval between points, a smoothing option, and a number of repetitions of the smoothing option.).

Given the space-independent, one energy group reactor kinetics equations and the initial conditions, this program determines the time variation of reactivity required to produce the given input of flux-time data.IBM360; FORTRAN IV; OS/360.

20496 **(ANL/NESC—174) FORE2; fast reactor excursion calculations.** Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Butz, H.R. (General Electric Co., Sunnyvale, CA (USA). Advanced Products Operation). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048174.

Reactor excursions which can be calculated are restricted to those transients in which the reactor is not substantially destroyed. As a general rule, changes in reactor geometry and composition during an excursion are limited to those cases in which the reactivity effects of the changes may be considered as small perturbations of the initial system. Thus, accidents involving large-scale disassembly and bulk meltdown of a core are not covered by FORE2. FORE2 is valid only while the core retains its initial geometry .

FORE2 is a coupled thermal hydraulics-point kinetics digital computer code designed to calculate significant reactor parameters under steady-state conditions, or as functions of time during transients. The transients may result from a programmed reactivity insertion or a power change. Variable inlet coolant flow rate and temperature are considered. The code calculates the reactor power, the individual reactivity feedbacks, and the temperature of coolant, cladding, fuel, structure, and additional material for up to seven axial positions in three channel types which represent radial zones of the reactor. The heat of fusion, accompanying fuel melting, the liquid metal voiding reactivity, and the spatial and the time variation of the fuel cladding gap coefficient due to changes in gap size are considered.GE635;IBM360; FORTRAN IV; GECOS (GE635), OS/360 (IBM360); 3 files and 40K memory (GE635).

20497 **(ANL/NESC—184) BRT1; thermal spectrum cross section calculations.** Bennett, C.L.; Purcell, W.L. (Pacific Northwest Lab., Richland, WA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048184.

BRT1, like the original THERMOS code developed by H. Honeck of Brookhaven National Laboratory, computes the scalar thermal neutron spectrum as a function of position in a lattice by solving the integral transport equation with isotropic scattering. One-dimensional slab or cylindrical geometry may be used. As output the code supplies flux-averaged values of sigma a, sigma f, nu sigma f, sigma s, and d for the cell composition and the values of sigma a, sigma f, nu sigma f, sigma s, and sigma tr for the isotopic constituents.UNIVAC1108; FORTRAN V; CSCX; 64K memory, input, output, program, library, and punch units plus 3 scratch units or equivalent drum storage.

20498 **(ANL/NESC—196) CURIE; fission product inventory decay history.** Klickman, A.E.; Froehle, P.H. (Argonne National Lab., IL (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048196.

Maxima of - 20 decay times 10 elements for which fission product histories are printed.

CURIE calculates the fission product inventory decay history for fuel that has been in operation for a specified duration. The inventory decay history is provided for specified nuclides and elements, as well as the total fission products.IBM370; FORTRAN IV; OS/370; 250K bytes of storage are required.

20499 **(ANL/NESC—249) LASER; spectrum calculations with burnup cylindrical lattice.** Carson, C.E. (Tennessee Valley Authority, Chattanooga (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048249.

This version of LASER is restricted to one-dimensional, cylindrical geometry. The maximum number of space points is 14, with a maximum of 5 space points in the fuel region. The code is restricted to 4 mixtures (moderator, non-absorbing heavy scatter, cladding, fuel). The moderator can be either light water (Nelkin or free gas scattering kernel), or heavy water (Nelkin scattering kernel). The cladding material can be stainless steel, aluminum or zircalloy-2. The fuel can be a metal oxide or cermet. The epithermal and fast energy ranges include 50 energy groups. The thermal range includes 35 energy groups. Only the U235 chain (through U236) and the U238 chain (through Pu242) are available in the code. The fission products are separated into Xe135, the directly-produced Sm149, and all other fission products lumped into one pseudo fission product. The cross sections for the lumped fission products are represented by polynomials in the burnup. The spatial distribution of U238 resonance captures within the fuel rods is given as input.

LASER is based on modified versions of the slowing-down program MUFT and the thermalization transport theory program THERMOS, and performs a calculation of the neutron spectrum in a uniform lattice made up of cylindrical rods, cladding, and surrounding moderator. The thermal cutoff in LASER is 1.855 eV. The program performs a burnup calculation for the lattice. The spatial distribution of burnup within the fuel rods is explicitly calculated. The program will, at option, account for all non-linearities and mutual connections in the system of burnup equations. This calculation accounts for the variation of the neutron flux in space and energy during each time-step. A buckling, and a boron poison, criticality search are provided as options. Output includes edits in the energy range 0 to 0.625 eV.IBM360,370; FORTRAN IV; OS/360; 150K with library tape and 2 scratch units.

20500 **(ANL/NESC—255) R101; space-independent kinetics kex options.** Kaganove, J.J. (Argonne National Lab., IL (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048255.

R101 solves the space-independent, one-energy group reactor kinetics equations to determine the time variation of neutron density given specified initial conditions. Any of four programmed representations of excess reactivity can be selected.IBM360; FORTRAN IV; OS/360; 240K bytes of storage.

20501 **(ANL/NESC—273) THREDES; one-dimensional few group diffusion design system.** Blaine, R.A. (Atomics International, Canoga Park, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048273.

Maxima of - BAM - 10 regions 100 space points 20 isotopes per region FORM - 18 different isotopes FOG - 4 groups 238 space points KINDLE - 2 groups .

THREDES is a scientific applications programming system. Incorporated in this system are the necessary modules to perform parametric design studies of thermal reactors including the thermal cell homogenization (BAM), the fast spectrum calculation (FORM - NESC Abstract 51), reactor diffusion theory (FOG - NESC Abstract 28), and zero-dimensional burnup (KINDLE) calculations. These modules can be used in conjunction with one another or individually.IBM360; FORTRAN IV; OS/360; 256K bytes.

20502 **(ANL/NESC—277) HAMMER;LITHE;HELP; critical analysis system.** Honeck, H.C. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048277.

Cell calculations - maxima of 30 thermal groups 54 epithermal groups 20 space points 20 regions 18 isotopes 10 mixtures 3 thermal upscattering mixtures 200 resonances per group no overlap or interference single level only Reactor calculations - maxima of 40 regions 40 mixtures 250 space points 4 groups.

HAMMER performs infinite lattice, one-dimensional cell multigroup calculations, followed (optionally) by one-dimensional, few-group, multiregion reactor calculations with neutron balance edits.IBM360; FORTRAN IV and BAL; OS/360; 512K bytes and 10 sequential data sets.

20503 **(ANL/NESC—279) LEOPARD;SPOTS; sjectrum calculation with depletion.** Barry, R.F. (Westinghouse Electric Corp., Pittsburgh, PA (USA). Atomic Power Div.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048279.

LEOPARD works with nuclides commonly used in water reactors. Thorium and U238 fuel chains are allowed.

LEOPARD is a unit cell homogenization and spectrum generation (MUFT-SOFOCATE type) program with a fuel depletion option.IBM360;UNIVAC1108; FORTRAN IV(H) (IBM360) and FORTRAN V (UNIVAC1108); OS/360 (IBM360) and EXEC2 (UNIVAC1108); 50K (decimal) memory.

20504 **(ANL/NESC—290) GASA (GA Stability Analysis); stability analysis for reactor kinetic equations.** Baxter, A. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048290.

GASA determines the stability of any physical system whose motion is describable by a set of first-order linear differential equations. In particular GASA evaluates the stability of a reactor described by the linear reactor kinetics equations with temperature feedback, against perturbations about any operating power level. The program will also calculate and plot the transfer function between any state variable of the system and a given external forcing function (such as an external reactivity perturbation) or another state variable of the system.UNIVAC1108; FORTRAN IV; EXEC2; 64K memory.

20505 **(ANL/NESC—303) BLOOST6; combined kinetics two-dimensional heat transfer.** Merrill, M.H. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048303.

Two-dimensional heat transfer routines are limited to r-z geometry, 36 regions, 19 materials, 15 radial mesh points, 20 axial mesh points, 6 radial region boundaries, 10 axial region boundaries, and inner and outer axial coolants. Kinetics equations allow 6 delayed groups and 2 temperature coefficients. Two types of fuel particles are permitted.

BLOOST6 combines a reactor space-independent kinetics code with a two-dimensional heat transfer code, and a time-dependent spherical geometry heat transfer routine for fuel particles. The code is applicable to problems for which the space-independent form of the reactor kinetics equation is applicable.UNIVAC1108; FORTRAN IV and Assembly language; EXEC2, GAX27; 64K memory with 2 tapes (I/O).

20506 **(ANL/NESC—304) PERT4; two-dimensional perturbation in xy, rz, and r-theta geometry.** Little, W.W. (Pacific Northwest Lab., Richland, WA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048304.

PERT4 will handle up to 26 energy groups with a 50 x 50 spatial mesh.

PERT4 computes reactivity coefficient traverses in x-y, r-z, or r-theta geometry using the first-order perturbation equations in the diffusion approximation. Flux and adjoint input can be taken directly from 2-D calculations or synthesized from radial and axial 1-D calculations. The code can also be used to compute activity traverses for any cross section of any material, the neutron generation time, and the effective delayed neutron fraction.UNIVAC1108; FORTRAN IV; 65K memory.

20507 **(ANL/NESC—307) HWOCR-SAFE; two-dimensional Monte Carlo cell calculation.** Levitt, L.B.; Lewis, R.C. (Atomics International, Canoga Park, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048307.

The HWOCR-SAFE program is a two-dimensional cell code in which the cell is assumed to be rectangular. Up to 20 material regions (zones) can be specified where one of the zones is completely described by the cell boundaries. All other zones are assigned concentric cylinders which lie within a cylinder described as outer wall boundary, or within the right circular cylindrical rods which are inserted in the innermost cylinder designated as the inner wall boundary. Up to 40 rods may be inserted, and 6 types of rod may be specified.

HWOCR-SAFE is a Monte Carlo thermal reactor analysis program designed for use with proposed HWOCR lattice configurations. It is a benchmark tool to check multigroup diffusion and transport calculations and to evaluate the effect of their use of geometric approximations.IBM360; FORTRAN IV (H) and BAL; OS/360.

20508 **(ANL/NESC—309) TSN; spatially-dependent reactor kinetics.** Rhoades, W.A. (Atomics International, Canoga Park, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048309.

The time-dependent neutron transport equation is solved. Energy deposition is allowed to cause variation in the neutron cross sections for the core region, in the core density, and in core height. The result is a kinetics calculation including spatial dependence both in feedback effects and in neutron density. The results are summarized in a manner similar to point-kinetics codes, and spatial distributions are also given. Graphical summaries of the significant variables and spatial distributions are given. In the IBM360 version, either the neutron yield from fission or the thickness of a specified zone can be changed as an independent function of time as specified by the user. This provides two ways of allowing explicit reactivity variation with time.IBM360; FORTRAN IV; OS/360; IBM360 Model 50H or larger.

20509 **(ANL/NESC—311) BURNUP; heavy element isotopic burnup analysis.** Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; McLaughlin, T.V. (General Electric Co., Pleasanton, CA (USA). Vallecitos Nucleonics Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048311.

A maximum of 50 samples can be run in any one case. Although a single sample can be processed, the averaging procedures for nuclear constants are most effective when 5 to 50 samples from the same fuel load are pooled in a single case .

BURNUP correlates heavy element isotopic analysis with fission product neodymium, uranium, and plutonium concentrations in an irradiated uranium fuel for calculation of burnup (atom per cent fission and MWD/MT). Reactor parameters, including effective neutron absorption cross sections for all uranium and plutonium isotopes, capture-to-fission ratios for U235, Pu239, and Pu241, a two-group description of the neutron spectrum, the average neutron temperature, the reactor fast fission factor, and the distribution of the sources of fission among the fissionable nuclides are computed from the experimental data obtained from the mass spectrometric analysis of uranium, plutonium, and neodymium.GE635; FORTRAN IV; GECOS; 32K memory and an on-line printer.

20510 **(ANL/NESC—313) CINDER;M0102; point depletion fission product.** England, T.R. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048313.

The program is limited to 500 total nuclides formed in up to 240 chains of 20 or fewer nuclides each. Up to 10 nuclides may act as fission product sources, contributing to power, and as many as 99 time-steps of arbitrary length are permitted. All stable nuclides must have a cross section if zero power time-increments are anticipated.

CINDER is a four-group, one-point depletion and fission product program based on the evaluation of a general analytical solution of nuclides coupled in any linear sequence of radioactive decays and neutron absorptions in a specified neutron flux spectrum. The desired depletion and fission product chains and all physical data are specified by the problem originator. The program computes individual nuclide number densities, activities, nine energy-group disintegration rates, and macroscopic and barns/fission poisons at each time-step as well as selected summaries of these data.CDC6600;IBM360; FORTRAN IV (CDC6600), FORTRAN IV and BAL (IBM360).

20511 (ANL/NESC—316) **GAFGAR;p3t;PROC;TAPCOP; spectra and group-averaged cross section calculation.** Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Wagner, R.M. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048316.

The maximum of 1740 fine groups in the GAF section may be subdivided into 10 or less sets of fine groups having a constant lethargy width. The GAR section requires a uniform spacing between the maximum of 14,700 discrete velocities. The maximum number of nuclides in a problem is 20, and the maximum total number of broad groups (output for nuclear design calculations) is 99 with a maximum of 20 broad groups in the GAR section.

The problem is to obtain very detailed neutron flux and current distributions as functions of energy considering explicitly the possible overlap effects between resonances of a resonance absorber and of mixtures of resonance absorbers and to use these distributions to prepare group-averaged cross sections and transfer arrays for use in fast reactor analyses.UNIVAC1108; FORTRAN IV; EXEC2, GAX33A; 52K of available fast memory and 5 magnetic tape units plus 5 scratch files (drum files are used on the UNIVAC1108) totaling about 600K in capacity.

20512 (ANL/NESC—317) **GAPOTKIN; space-independent reactor kinetics.** Koch, P.K. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048317.

GAPOTKIN will handle up to 20 time zones and will allow for 50 power-dependent or energy-dependent reactivity coefficients per time zone if tables are used. General data are stored for up to 500 time-steps and time delay data are stored for 10,000 time-steps.

GAPOTKIN is a point-kinetics code that solves the space-independent kinetics equations for a very general form of the reactivity function.UNIVAC1108; FORTRAN IV; EXEC2, GAX29; GAPOTKIN requires 4100 storage locations. The data storage requirement is roughly 33,000 locations. Two I/O devices are required for reading and printing and one additional I/O device is necessary if the program is loaded from tape.

20513 (ANL/NESC—326) **AIROS2A; simulation of reactor dynamics.** Nickols, A.N. (Atomics International, Canoga Park, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048326.

Maxima of - 15 delayed neutron precursor groups 400 feedback variables 90 feedback variables printed out Any number of channels and nodes per channel within the limitation above are allowed.; Sourceence reports.

AIROS2A solves the space-independent reactor kinetics equations and provides for the determination of reactivity by solving in addition the discretized equations that represent the spatial heat and mass transfer model for several fuel channels. In addition, variation of the film coefficient with flow is accounted for along with the provision for flow decay and afterglow heating. Scrams can be initiated by delayed signals from instruments that sense any quantity calculated, e.g., power, inverse period or temperature. Generalized feedback equations are used to provide flexibility in the models that represent multichannel heat transfer including conduction and convection, energy, pressure and other phenomenon such as fuel melting, coolant boiling and voiding burn-out. The reactivity equation is also generalized. The reactivity feedback coefficients can be constant or vary as the square root or reciprocal of temperature. Furthermore, any feedback variable can be used to initiate a reactivity scram, each with a unique delay time. An input generator computes the conduction and convection coefficients for an n x m nodal, multichannel system using built-in tables of specific heat, density, conductivity and viscosity for the common fuel, structure and coolant materials, and performs an initial temperature calculation. The film coefficients may be specified or calculated using Lyon's equation or the Dittus-Boelter equation.IBM360; FORTRAN IV (95%) and Assembly language (5%); OS/360; 256K byte IBM360 and an SC-4020 graphical display device.

20514 (ANL/NESC—345) **GAND; GAFGAR cross-section library preparation.** Archibald, R.J.; Mathews, D.R. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048345.

Maxima of - 20 ENDF/B materials processed in a single problem 35 resonance levels on either side of the incident neutron energy.

GAND prepares the cross sections needed for detailed computations of neutron energy spectra in fast reactors from a file of basic nuclear data in the ENDF/B format.UNIVAC1108; FORTRAN IV; EXEC2, GAX35; 52K memory and 4 to 8 magnetic tape units plus 5 scratch files (drum files are used on the UNIVAC1108) totaling about 1310K in capacity.

20515 (ANL/NESC—356) **ZPR-III Assembly 48 GAFGAR ENDF/B Data Tapes; ZPR-III assembly 48 GAFGAR ENDF/B data tapes.** Baxter, A. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048356.

The two GAF tapes have 1038 fine groups starting at a lethargy of -0.4 with a deltau spacing at 0.01 for 960 groups to a lethargy of 9.2 followed by 78 groups with a spacing of 0.1 deltau to a lethargy of 17.0. The GAR tape has 14,457 points starting at 1.237663 times 106 m/s (8.007 keV) with a constant deltav of 85.0 m/s to 8.903 times 103 m/s (0.414 eV).

A benchmark study of ZPR-III Assembly 48 using ENDF/B cross sections was undertaken to identify possible cross section discrepancies in the microscopic ENDF/B data. This work was done for the CSEWG testing subcommittee as part of their Phase I data testing. This package contains the cross section data generated for this study in the form of the ultra-fine group cross sections of the materials of ZPR-III Assembly 48 in the format of the GGA GAF/GAR program data tapes.UNIVAC1108; Variable-length binary records.

20516 (ANL/NESC—363) **BLAST; reactor kinetics temperature distribution study.** Grosskopf, O.G.P. (South African Atomic Energy Board, Pretoria). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048363.

BLAST has been developed to study accident conditions in critical and subcritical thermal multiplying systems. The program computes the time behavior of the thermal neutron density and the system temperature following a step-change in reactivity. The integrated thermal neutron density is also computed, from which the total number of fissions during an excursion may be obtained.IBM360; FORTRAN IV; OS/360; 128K bytes of storage.

20517 (ANL/NESC—392) **RAFFLE; first flight collision probabilities for multiple-cell geometries.** Hermann, O.W.; Carlsmith, R.S. (Oak Ridge National Lab., TN (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048392.

Maxima of - 20 regions 10 different types of rods (differing in either geometry or materials) 50 rods per region 20 subregions per rod 12 regions with rods (only the first 12 regions counting from the cell center) 8 materials.

RAFFLE calculates neutron first-flight collision probabilities for a wide variety of three-dimensional cell geometry configurations. The outer boundaries of the cell cross section may be circular, square, or hexagonal. The cell may contain annular regions and/or clusters of rods.IBM360,370/195; FORTRAN IV and BAL; OS/360,370.

20518 (ANL/NESC—394R) JITER; fluctuation experiment analysis. Natelson, M.; Harris, D.R. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048394.

The kinetics model may have as many as 4 energy groups and up to 6 groups of delayed neutrons. Half the reactor core can be described with up to 300 spatial mesh points and as many as 5 different materials distributed in at most 50 spatial regions. A total of 10 modes can be used in the expansions.

JITER computes the following quantities measured in reactor fluctuation experiments - the dispersion parameter y, the modified coefficient of correlation MCC, the frequency dependent part of the power spectral density PSD, and the cross power spectral density CPSD.CDC6600; FORTRAN IV; 120,000 (octal) memory locations.

20519 (ANL/NESC—400) SAS1A; fast reactor power and flow transients. Heames, T.J. (Argonne National Lab., IL (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048400.

Maxima of - 20 axial heat transfer nodes in a fuel pin, in the upper blanket, and in the lower blanket 6 delay groups 60 regions used to describe the core 200 axial segments in the coolant channel 15 radial temperatures in the fuel.

SAS1A is used for the analysis of fast reactor power and flow transients. The program consists of four driver programs each called by the main program. These drivers handle the areas of (1) input/output, with diagnostics, (2) steady-state initialization, to define the core operating conditions before the initiation of the transient, (3) the transient portion, and (4) the disassembly (weak explosion) analysis.CDC6600;IBM360/75; FORTRAN IV; SCOPE (CDC6600) and OS/360 (IBM360); 410K bytes on the IBM360/75 (without overlays) and approximately 300K bytes on the IBM360/75 (with overlays).

20520 (ANL/NESC--415) CEXE;INCEXE; one-group, three-dimensional xyz xenon oscillation. Kern, R. (Combustion Engineering, Inc., Windsor, CT (USA). Computer Services Section). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048415.

Maximum reactor core size representation is restricted to a nodal configuration of 19 x 19 x 10 in the x, y, z directions, respectively.

CEXE solves the three-dimensional xyz time-dependent xenon spatial oscillation problem using a modified one energy group theory and a nodal representation.IBM360; FORTRAN IV; OS/360; 256K bytes, 6 IBM2314 disk drives, and 3 IBM2400 tape drives.

20521 (ANL/NESC—420) GROUSE; space-dependent cross section generation. Henderson, W.B. (Westinghouse Electric Corp., Pittsburgh, PA (USA). PWR Systems Div.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048420.

Maxima of - 99 groups 40 core zones 20 parametric values of core absorption cross section 3 parametric values of scattering cross section 25 isotopes 2600 fine energy lattice points The core can contain a mixture of isotopes if the isotopic composition is not a function of position.

GROUSE computes effective multigroup cross sections as a function of position in the core of a reactor or the absorber region of a fuel or control element. The flux weighting uses synthesized fluxes generated in fine energy detail from parametric flux traverses supplied as input as a function of the core absorption and scatter cross sections.GE625,635; FORTRAN IV; GECOS; 38K memory, 6 tapes or disk.

20522 (ANL/NESC—423) DOS; neutron flux-dosimeter activity relation. Henderson, W.B. (Westinghouse Electric Corp., Pittsburgh, PA (USA). PWR Systems Div.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048423.

DOS computes the local neutron flux per reference reactor power level which will produce the measured activity of a dosimeter. Alternatively, if the flux value is supplied, the corresponding dosimeter activity will be calculated.GE625,635; FORTRAN IV; GECOS III; 25K memory.

20523 (ANL/NESC—425R) REDUX; reactor fluctuation experiment analysis. Harris, D.R.; Natelson, M. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048425.

REDUX is used for the reduction of data from reactor fluctuation experiments. From input count samples recorded by one or two counting channels, the program computes unbiased sample estimates of moments and functions of moments of the count distributions, including the dispersion parameter y and the modified coefficient of correlation MCC. Standard error estimates are computed for y and MCC.CDC6600; FORTRAN IV; SCOPE; 64,000 (octal) locations.

20524 (ANL/NESC—427) FARED; one-dimensional fast reactor design & survey study. Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Livolsi, A.Z. [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048427.

Maxima of - 100 microgroups 30 multigroups 15 downscattering groups 150 mesh points 149 mesh intervals 149 mesh intervals per zone 50 unique nuclides 20 zones 20 blocks 100 zone materials 40 cells 30 nuclides per block 20 zones per block 2 cells per block 30 nuclides in a chain 500 resonance peaks per nuclide 15 nuclides per cell composition 30 nuclides per block composition 7 resonance nuclides per block 3000 storage locations for bulk material data.

FARED contains an internal cross section averaging routine which is responsible for preparing broad group cross section sets for various material regions of the reactor. The cross section averaging is performed in program REGA, which computes a B1 flux and current in up to 20 reactor block compositions for use as weighting functions in the cross section collapsing calculation. A homogeneous or heterogeneous resolved and unresolved resonance treatment is provided to compute effective microgroup resonance cross sections for the block mixture or up to 2 cell types per block. Real and adjoint flux distributions are calculated for one-dimensional slab, cylindrical, or spherical geometries. The real fluxes are normalized to yield desired total reactor power. Criticality searches may be performed on the reactor dimension, transverse buckling or zone compositions. Enrichment searches may be performed to yield desired ratios of maximum (or average) power densities in several zones. Zonewise depletion is calculated either for a given time period or until specified criticality, burnup or nuclide concentrations are satisfied. Flexible fuel management is available permitting specified material units to be moved into, out of or shuffled within the reactor. A wide variety of edits may be performed, including perturbation and kinetic parameters calculations.CDC6600; FOR-

TRAN IV and COMPASS; SCOPE 3; 45,000 (decimal) core storage and 16 tape drives or distinct disk files plus I/O.

20525 (ANL/NESC—455) DAC1; SN perturbation code using DTF4 fluxes. Carmichael, B.M. (Lawrence Livermore National Lab., CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048455.

The FORTRAN IV programming techniques such as variable dimensioning used in DTF4 are retained in DAC1. Consequently, any combination of problem parameters may be used which will fit in the over-all available storage. Generally, the problems that fit for DTF4 can also be accommodated by DAC1.

DAC1 uses angular fluxes from the DTF4 SN code to calculate reactivity perturbations, effective delayed neutron fractions, and generation times in reactors. The reference reactor specifications are input to DAC1 by a direct reading of the DTF4 input deck. Consequently, the only additional input needed are the perturbation specifications.CDC6600; FORTRAN IV; SCOPE 3; 2 disk or tape files are required if angular fluxes are used.

20526 (ANL/NESC—456) DBUFIT1; least squares transmutation analysis. Matsen, R.P. (Pacific Northwest Lab., Richland, WA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048456.

The data from as many as 150 samples may be analyzed at one time.

DBUFIT1 is designed to extract integral cross section information from isotopic burnup data. This information is obtained by fitting burnup equations to the isotopic data using least-squares fitting techniques. Burnup equations for the following transmutation chains have been programmed - Pu239 to Pu242, U238 to Pu242, Pu242 to Cm244 and U235 to Pu238.UNIVAC1108; FORTRAN V; CSCX Operating System; Core memory requirements are 40,000 (octal) locations for instructions and almost 50,000 (octal) locations for data storage. A CalComp plotter is necessary if plotted results are desired.

20527 (ANL/NESC—457) GSSLRN1B; least squares photopeak spectra code. Seybold, G.D. (Pacific Northwest Lab., Richland, WA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048457.

Maxima of - 2048 channels from a multichannel analyzer per case 200 fitted peaks per case 250 channels per interval of fit 10 peaks per interval of fit 49 parameters per interval of fit These limits are based upon analysis of photopeaks described by symmetric Gaussian analytical form.

GSSLRN1B is utilized for evaluations and statistical determination of photopeaks in photon spectra. The code performs evaluations of photopeak spectra using as input the digitized, pulse-height distribution which is output from a large multichannel analyzer. Photopeaks are located, functions fit to each real peak, and the relative intensity of each fitted peak above the background continuum is calculated. The code is easily adaptable for analysis of any spectra which can be adequately defined by peaks represented in analytic form.UNIVAC1108; FORTRAN V with Assembler language used for two minor routines; CSCX Operating System; 65K core, 131,000 (octal) locations of scratch drum, two tapes, CalComp 763 plotter for plotting options.

20528 (ANL/NESC—463) 3DDT; 3-dimensional multigroup diffusion xyz or r-theta-z. Vigil, J.C. (Lawrence Livermore National Lab., CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048463.

3DDT is a three-dimensional (x-y-z or r-theta-z) multigroup, diffusion theory code for use in fast-reactor analysis. The code can be used to compute keff or to perform criticality searches on reactor composition, time absorption, and reactor dimensions by either the regular or the adjoint flux equations. Material burnup and fission-product buildup can be computed for specified time intervals, and criticality searches can be performed during burnup to compensate for fuel depletion and fission product growth.CDC6600; FORTRAN IV; SCOPE 3.2; CDC6600 computer with 65K words central memory, 500K ECS, 6,000K disk (four tape files are simulated on the disk), two magnetic tape units, and the usual input/output devices.

20529 (ANL/NESC—465) RESEND;ADLER; ENDF/B resonance cross section codes. Bhat, M.R.; Ozer, O. (Brookhaven National Lab., Upton, NY (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048465.

RESEND generates infinitely-dilute, unbroadened, point cross sections in the ENDF format by combining ENDF File 3 background cross sections with points calculated from ENDF File 2 resonance parameter data. ADLER calculates total, capture, and fission cross sections from the corresponding Adler-Adler parameters in the ENDF/B File 2 Version II data and also Doppler-broadens cross sections.CDC6600;PDP10; FORTRAN IV; SCOPE 3.0; RESEND requires 24K (decimal) core with 2 scratch units, an input unit for the ENDF data, an output unit, a unit for reading in the run parameters (teletype or system input) and a unit for printing run-associated messages (teletype or system output). ADLER requires 37K (octal) memory.

20530 (ANL/NESC—466) APRFX1; 99-group DLC-2B library group-collapsing. Pickard, P.S. (Army Pulse Radiation Facility, Aberdeen Proving Ground, MD (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048466.

This version of the code uses the DLC-2B library in ANISN-DOT format. Upscattering is not included.

APRFX1 collapses and combines cross section sets for multigroup transport calculations. It performs group collapsing for as many isotopes, mixtures, and Legendre expansion sets as desired from the DLC-2B library. The DLC-2B library structure employs tenth lethargy unit intervals from 15 MeV to 111 keV and quarter lethargy intervals down to 0.414 eV. A 100th group 0.0 to 0.414 eV is used as a sink group. The code also determines the broad-group input source and generates averaged neutron velocities for use with transport calculations.CDC6600; FORTRAN IV.

20531 (ANL/NESC—467) HRG3; slowing-down spectrum, multigroup constants. Carter, J.L. (Pacific Northwest Lab., Richland, WA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048467.

The maximum number of broad groups is 33. Broad-group boundaries are adjusted internally to coincide with one of the 68 fine-group boundaries.

The code computes the slowing down spectrum over the energy range 10 MeV to 0.414 eV in either the B1 or P1 approximation, using 68 groups of neutrons with a constant group width of delta u = 0.25. The calculated flux and current spectra are used to reduce the original 68-group cross section data to average values over as many as 33 broad groups. Output is printed and may also be punched in formats for input to any of several spatial multigroup codes.UNIVAC1108;IBM360,370; FORTRAN IV; CSCX (UNIVAC1108), OS/360 (IBM360); 64K memory, normal input, output, program, and punch units, 1 unit for library, 1 to 4 scratch units or their equivalent on drum (UNIVAC1108); 200K memory, standard I/O units, 1 unit for library, and 1 scratch unit (IBM360).

20532 (ANL/NESC—471) GAPER2D; 2-dimensional perturbation calculation from 2DF output. Archibald, R.J.; Sargis, D.A. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048471.

Scattering anisotropy is limited to the P1 term.

GAPER2D is a two-dimensional transport perturbation theory program using the real and adjoint fluxes and currents from 2DF problem results to compute reactivity changes due to small perturbations in reflected multiregion systems.UNIVAC1108; FORTRAN V; EXEC2 or EXEC8; 65K fast memory, 2 tape units, 4 drum or disk files.

20533 (ANL/NESC—474) QX1; **quasistatic spatial reactor kinetics code.** Meneley, D.A. (Argonne National Lab., IL (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048474.

Maximum of 30 energy groups 15 downscatter groups 6 delayed neutron families 20 spatial regions 16 material mixtures per region 150 mesh points.

QX1 solves the multigroup, one-dimensional, time-dependent diffusion equations. Problem geometry may be plane, cylindrical, or spherical. Steady-state initial conditions may be established either for a source-free system or for a system with an external neutron source. The reactor may be perturbed by changing material volume fractions and/or temperatures or by changing the neutron source level. A first-collision pulsed source distribution may be specified. Resonance absorption feedback is calculated by groupwise interpolation in a cross-section versus temperature table. A highly simplified fuel temperature model is included.IBM360/75; FORTRAN IV; OS/360; 450K byte memory, input, output, and punch datasets, a maximum of 2 cross section datasets, and a maximum of 6 scratch datasets.

20534 (ANL/NESC—477R) 3DXT;DEP3; **3-dimensional xenon transient and depletion.** Stacey, W.M.; Wade, D.C. (Knolls Atomic Power Lab., Schenectady, NY (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048477.

3DXT maximum - 100 time-steps DEP3 maximum - 30 time-steps with 1 to 5 xenon-steps per depletion-step.

These two codes were developed for use with detailed reactor physics calculations to obtain 3-dimensional xenon transient (3DXT) and depletion (DEP3) calculations. They are well-suited for survey studies and because they incorporate three-dimensional effects with thermal feedback and rod search capabilities, are useful for assessing situations such as rod misalignments or fuel-loading and coolant-flow asymmetries which are time-consuming and often impossible to detect with detailed 1- or 2-dimensional codes.CDC6600; FORTRAN IV; 64K memory.

20535 (ANL/NESC—486) ANCON; **space-independent reactor kinetics code.** Vigil, J.C. (Lawrence Livermore National Lab., CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048486.

ANCON solves the point-reactor kinetic equations including thermal feedback. Lump-type heat balance equations are used to represent the thermodynamics, and the heat capacity of each lump can vary with temperature. Thermal feedback can be either a linear or a non-linear function of lump temperature, and the impressed reactivity can be either a polynomial or sinusoidal function.CDC6600;IBM360,303x; FORTRAN IV; SCOPE 3.2 (CDC6600) and OS/360 (IBM360); ANCON requires 32K words of central memory, one peripheral storage device (logical unit 1), card reader (logical unit 10), printer (logical unit 9), and card punch. Standard system-library functions and a CLOCK routine are used. The CLOCK routine is not essential. A dummy CLOCK routine is provided with the IBM360 version package.

20536 (ANL/NESC—488) NOISY1; **auto- and cross-spectral densities.** Sheff, J.R. (Sheff (James R.) Co., Richland, WA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048488.

Maximum of 50 terms per dimension in the six-dimensional series. The limit is thus 50**6 or about 16-billion terms. This is large enough so that the limit is really budgetary. Automatic convergence checking limits the maximum number of terms to approximately 300,000.

Auto- and cross-spectral density functions are calculated for neutron fluctuations in nuclear reactors. The calculations are pointwise, space-dependent in cubical reactors which are homogeneous and bare. Either neutron fluctuations or the fluctuations seen by a neutron detector can be specified. Fluctuations between either two points or between two finite regions can be considered. The finite regions or simulated detectors must either fully overlap or not overlap and are restricted in shape to rectangular parallelepipeds.UNIVAC1108; FORTRAN V; CSCX or EXEC2; 52K words memory.

20537 (ANL/NESC—490) JOSHUA OPERATING SYSTEM; **data storage, retrieval, and display.** Honeck, H.C. (Argonne National Lab., IL (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048490.

JOSHUA is a scientific, modular data-based system for batch and terminal operation. Large volumes of data can be stored and retrieved for computation and display.IBM360,370,303x; FORTRAN IV (60%) and Assembler language (40%); OS/370, OS/3033; 200K bytes for batch operation, IBM3270 display station.

20538 (ANL/NESC—493) TROUT; **mug multigroup cross section library maintenance.** Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Kelley, M.D. (General Electric Co., San Jose, CA (USA). Nuclear Energy Div.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048493.

Up to four file tapes may be mounted and merged into a single file tape. A file tape may not have more than 30 files.

TROUT is a file maintenance program which allows the user to alter, merge, delete, overlay or create multigroup cross section files in MUG format.GE635;UNIVAC1108; FORTRAN IV; GECOS III (GE635) and EXEC2 (UNIVAC1108); 25K of fast memory, 6 tape drives, and 4000 words of peripheral storage (GE635).

20539 (ANL/NESC—494) ADEP; **1-dimensional and 2-dimensional few-group space-time kinetics.** Denning, R.S. (Battelle Columbus Labs., OH (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048494.

Variable dimensioning permits flexibility in the number of energy groups, number of delayed precursors, number of regions, and number of mesh points. Problems are initiated from equilibrium conditions. Zero flux boundary conditions apply at all surfaces.

The time-dependent few-group neutron diffusion equations are solved in one or two dimensions. Lumped parameter thermal-hydraulic equations are used to calculate feedback.CDC6400; FORTRAN IV; SCOPE 3.3; 40,000 (octal) memory needed to load the basic program.

20540 (ANL/NESC—502) EDITOR; **ENDF/B tape processing and editing.** Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Penny, S.K. (Oak Ridge National Lab., TN (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048502.

A maximum of 50 materials may be handled in one batch, where a batch is a group of associated input instructions. A maximum of 5 files per material and 15 sections per file may be requested in each batch. Files 1 to 5, 7, 12 to 15, and 23 will be processed by the program. Other files will be ignored.

EDITOR produces readable listings of the contents of ENDF/B nuclear data cross section tapes. It also allows copying, altering mode, merging and punching of the data on one or more ENDF/B tapes.IBM360;CDC6600; FORTRAN IV; OS/360 (IBM360), SCOPE (CDC6600); Approximately 300K bytes of core.

20541 (ANL/NESC—505) **TDOWN; spatial & composition-dependent cross sections.** Cowan, C.L. (General Electric Co., San Jose, CA (USA). Nuclear Energy Div.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048505.

Most of the restrictions on TDOWN are due to the limitations of the linked codes. Some of these limitations are - a generalized file has a maximum of 100 energy groups, and up to 120 material cross section sets may be generated.

TDOWN generates spatial and composition-dependent cross section sets from a Bondarenko type, generalized cross section file called GMUG. A TDOWN problem can be a simple description of material compositions with an input flux spectra or a problem can consist of a multi-region, two-dimensional reactor description with several zero- or one-dimensional flux solutions to provide the flux for spectral adjustments of the cross section sets.GE635; FORTRAN IV; GECOS III; The code requires 32K memory on a GE635, including a 10K overlap with the loading routines. In addition to the usual input/output units, 3 tape handlers and 6 files on a peripheral device (disk at the authors' installation) are used.

20542 (ANL/NESC—509) **ETOT2; thermal libraries from ENDF/B data.** Beard, C.L.; Dannels, R.A. (Westinghouse Electric Corp., Pittsburgh, PA (USA). Nuclear Energy Systems Div.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048509.

In addition to the restrictions on the ENDF/B data itself, ETOT2 has the following restrictions - Maximum number of groups or points = 309. Maximum number of resolved resonances = 500.

ETOT2 processes basic nuclear information given in the ENDF/B library tape Formats I and II and produces data decks for use in the generation of KATE, THERMOS (NESC Abstract 184), TEMPEST (NESC Abstract 50), and LASER (NESC Abstract 249) libraries.CDC7600; FORTRAN IV; CDC7600 SCOPE 1.7; The code requires 50K (decimal) memory on the CDC7600, uses 1 scratch tape, 1 library tape, and the standard input/output and punch units.

20543 (ANL/NESC—520) **PHROG; multi-group constant and fast spectra calculations.** Curtis, R.L.; Grimesey, R.A. (EG and G Idaho, Inc., Idaho Falls (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048520.

The code is restricted to a 68 group structure for input.

PHROG generates energy dependent fast neutron spectra and associated multigroup cross section data suitable for use in diffusion and transport theory reactor design analysis. The solution utilizes 68 equal lethargy groups of cross section, source, and leakage data over an energy range extending from 10 MeV to 0.414 eV. These data are then coalesced into broad group form using the fluxes and currents as weighting functions.IBM360; FORTRAN IV; OS/360; 200K bytes memory and six I/O devices including card reader, printer, card punch, tape unit for cross section library, and 2 scratch units.

20544 (ANL/NESC—522) **ARC-SYSTEM; system subprograms and modules.** Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Walker, P.M. (Argonne National Lab., IL (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048522.

BCD input data restrictions are set at 100 ARC System data blocks and 2000 EBCDIC data cards. An ARC System data block is a named set of data containing named subblocks of data which are processed into data sets by a call to the system routine BCDDS.

ARC-SYSTEM is the collection of systems subprograms and modules which provide the software environment necessary to execute the modular computational capabilities of the Argonne Reactor Computation (ARC) System on IBM360 systems.IBM360/50 and larger models; FORTRAN IV, Assembler language, and macro definitions; OS/360 Release 19; The resident portion of the system itself requires about 15K bytes. To test the system requires about 220K bytes plus one peripheral I/O device.

20545 (ANL/NESC—523) **ESP; Monte Carlo reactor analysis calculation.** Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Lucius, J.L. (Oak Ridge National Lab., TN (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048523.

ESP is a general-purpose Monte Carlo reactor analysis code. It covers the complete energy range of interest in reactor calculations and is designed for both eigenvalue and fixed source reactor and reactor cell calculations. Basic data are accepted only in the Version I, II, and III ENDF/B format. In addition to smooth data, the cross section preparation includes a detailed treatment of resolved and unresolved resonances and the free gas and s(alpha,beta) thermal models. The collision and source routines utilize the ENDF/B nonelastic secondary distributions, the anisotropic scattering data, and the fission spectra. The energy range may be divided into as many as 25,000 intervals, and over each interval the appropriately averaged cross sections are used as constant point-energy values. A general three-dimensional geometry description is available, as well as several specialized geometries. Use of fixed-source options allows calculations on non-multiplying systems. A steady-state analysis of neutron histories is performed in computer core for such quantities as neutron fluxes, reaction rates, and cross sections, averaged over arbitrary energy and spatial regions.IBM360/75,91; FORTRAN IV and BAL; At least 350K bytes of computer core.

20546 (ANL/NESC—526) **CLUP77; square cell collision probability calculations.** Tsuchihashi, K. (Japan Atomic Energy Research Inst., Tokai, Ibaraki. Tokai Research Establishment). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048526.

A maximum of 120 assemblies are allowed and all assemblies must be symmetric both bilaterally and diagonally.

CLUP77 computes the collision probabilities in a multiregion square assembly of clustered fuel rods. The assembly can be made up of rods of infinite height and divided into rectangular pillars containing a nest of concentric annuli of different materials. The outer boundary of the assembly may be treated as reflective or a vacuum.FACOM230-60;IBM360; FORTRAN IV; FACOM Operating System (FACOM 230-60) and OS/360 (IBM360); 57K (octal) words on the FACOM, 250K bytes on the IBM360.

20547 (ANL/NESC—531R) **CLEM; angular distribution Legendre fitting.** Slavik, C.J. (Knolls Atomic Power Lab., Schenectady, NY (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048531.

CLEM generates constrained Legendre moments for neutron scattering angular distributions. The constraint is that the angular distribution itself should be non-negative.CDC6600; FORTRAN IV; SCOPE 3.2; 300K, usual I/O, and one tape unit.

20548 (ANL/NESC—532) LASL group-averaged cross-sections; SN 18- 24- and 25-group sets. Mills, C.B. (Lawrence Livermore National Lab., CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048532.

Group constants and computed neutron cross sections are tabulated for a variety of materials including - Al, B, Be, C, Cd, Cl, D, Ga, F194, Fe, H, K, Li6, Mo, Na, Ni, O, Pu239, Pu240, Pu249, Th, U233, U235, U238, and Zr. These are presented as 18-, 24-, and 25-group calculations for reactors with neutron energies ranging from fast to thermal.CDC6600; FORTRAN IV; SCOPE.

20549 (ANL/NESC—533) ARC-NUI002 BCD Input Processor; BCD input data processing module. Kovalsky, E.A. (Argonne National Lab., IL (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048533.

The module ARC(NUI002) processes general neutronics input data sets for subsequent use by the neutronics-computational modules of the Argonne Reactor Computation (ARC) System.IBM360/50 and larger models; FORTRAN IV; OS/360 MVT; About 255K bytes are required with a 10,000 double-word container (default). One peripheral I/O device is required.

20550 (ANL/NESC—535R) MULTI; multi-level resonance theory cross section calculations. Slavik, C.J. (Knolls Atomic Power Lab., Schenectady, NY (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048535.

Only s-wave incident neutrons are allowed.

MULTI computes scattering cross sections.CDC6600; FORTRAN IV; SCOPE; Input, output, and two tape units.

20551 (ANL/NESC—536) RAHAB Lattice Physics Modules; JOSHUA system lattice physics modules. Honeck, H.C. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048536.

The code is restricted to 150 mesh points, 100 energy groups and 50 different isotopes.

RAHAB is a two-dimensional, multigroup, neutron integral transport code. Its capability includes full or subdivided annular, square and hexagon regions, clusters and multicell (mixed lattices). The multigroup structure can include thermal, epithermal, and fast energy regions. The number of energy groups is variable from 1 to 100. Buckling and time eigenvalue searches are allowed options.IBM360; FORTRAN IV; OS/360 and HASP; 260K bytes.

20552 (ANL/NESC—538) ETOG3; ENDF/B to MUFT, GAM, ANISN cross-section format. Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Kellman, S. (Westinghouse Electric Corp., Pittsburgh, PA (USA). Nuclear Energy Systems Div.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048538.

In addition to the restrictions on the ENDF/B data itself, ETOG3 has the following maxima - 99 multigroups 500 resolved resonances.

ETOG3 processes basic nuclear information given in ENDF/B Version III format producing data decks for use in generation of MUFT4, MUFT5, GAM1, GAM2, and ANISN libraries.CDC7600; FORTRAN IV; SCOPE 2.0; 42,000 decimal locations and 4 scratch and punch units, 17,000 decimal locations of extended core memory.

20553 (ANL/NESC—877) K-FIX;3D; three-dimensional extension two-phase flow dynamics. Rivard, W.C.; Torrey, M.D. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048877.

This package consists of two programs K-FIX(3D) and K-FIX(3D,FLX) which extend the transient, two-dimensional, two-fluid program K-FIX (NESC Abstract 727) to perform three-dimensional calculations. The transient dynamics of three-dimensional, two-phase flow with interfacial exchange are calculated at all flow speeds. Each phase is described in terms of its own density, velocity, and temperature. The application is to flow in the annulus between two cylinders where the inner cylinder moves periodically perpendicular to its axis. K-FIX(3D) is easily adaptable to a variety of two phase flow problems while K-FIX(3D,FLX) combines KFIX(3D), the three-dimensional version of the KFIX code, with the three-dimensional, elastic shell code FLX for application to a very specific class of problems. KFIX(3D,FLX) was developed specifically to calculate the coupled fluid-structure dynamics of a light water reactor core support barrel under accident conditions. Motion may be induced by blowdown, prescribed displacement, or seismic action.CDC7600; FORTRAN IV; SCOPE; The K-FIX(3D) sample problem, excluding plotting and timing routines, took about 50,000 (octal) words of small core memory (SCM) and 65,000 (octal) words of large core memory (LCM) storage. The K-FIX(3D,FLX) sample problem, excluding plotting and timing routines, took about 71,300 (octal) words of SCM and 570,000 (octal) words of LCM storage.

20554 (NUREG/CP—0034-Vol.1) Proceedings of the topical meeting on advances in reactor physics and core thermal hydraulics. (Nuclear Regulatory Commission, Washington, DC (USA)). Aug 1982. 549p. (CONF-820925—Vol.1). NTIS, PC A23/MF A01 - GPO $12.00. Order Number DE82906283.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

Technical papers presented at the ANS Topical Meeting on Advances in Reactor Physics and Core Thermal Hydraulics, September 22-24, 1982, at Kiamesha Lake, N.Y. are included in these Proceedings. Reactor physics, core thermal hydraulics, and the interactions between core physics and thermal hydraulics are covered both for thermal reactors and for fast breeders. There are sessions on current challenges in these areas, on measurement and analysis of fast reactor physics parameters, on coupled core physics and thermal-hydraulics analysis, on in-core fuel management, on nodal and homogenization methods in reactor physics, and on core thermal hydraulic and nuclear instrumentation.

20555 (NUREG/CP—0034-Vol.1, pp 364-376) Extensions of the nodal expansion method based on the application of finite element techniques. Robinson, M.A.; Rydin, R.A. (Univ. of Virginia, Charlottesville). Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

In the present study, the inclusion of trial functions in the Nodal Expansion Method (NEM), by means of techniques associated with the Finite Element Method (FEM), is explored. The results of several methods based on these techniques are examined, in terms of the capability to reproduce detailed flux shapes within a mesh box.

20556 (NUREG/CP—0034-Vol.1, pp 377-383) Response matrix nodal methods for thermal and fast reactor applications. Becker, M. (Rensselaer Polytechnic Inst., Troy, NY). Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

Response matrix nodal methods have been applied to both thermal and fast reactor problems. Several common nodal procedures are included as special cases. The general framework has been adaptable to modifying existing options and introducing new ones. For thermal reactors, several options give comparable, acceptable results. Current attention is being devoted to numerical efficiency. For fast reactors, results are sensitive to option used. A reflection-based coarse mesh method has been introduced for fast reactors which has been more successful than other options.

20557 (NUREG/CP—0034-Vol.1, pp 384-390) **Nodal method for direct intra-node ditribution calculation.** Chao, Y.A.; Penkrot, J.A. (Carnegie-Mellon Univ., Pittsburgh, PA). Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

A nodal method is developed which calculates intra-node flux distribution directly but solves only nodal equations of conventional structure and simplicity. For a given homogeneous node, the intra-node flux is rigorously and analytically expressed as a sole surface intergral of the complete multi-group and multi-dimensional Green's function and the surface fluxes. Assuming parabolic surface flux profiles, nodal equations involving surface fluxes as the only unknowns are derived. Each surface profile is expressed in terms of the flux values at the corners of a surface and the averaged flux value on that surface. For a 2-D (or 3-D) node, there are all together three (or four) unknowns; they are one corner flux and two (or three) surface averaged fluxes. Once these corner and surface averaged fluxes are solved from the nodal equations, the parabolic surface profile is known and the intra-node flux is immediately obtained.

20558 **(PB—82-228933) Nuclear data guide for reactor neutron metrology. part I: activation reactions (1979 edition). Part II: fission reactions (1979 edition).** Zijp, W.L.; Baard, J.H. (Commission of the European Communities, Luxembourg). [nd]. 246p. NTIS, PC AE09/MF E09.

This guide is a collection of data for activation and fission reactions, expressed throughout in SI units. The activation data are shown in the form of a cross-section as a function of energy, and two figures showing the energy dependence of the response function. These response plots are given for a light water reactor based on the Petten high flux reactor, and for a CTR Tokamak neutron spectrum. Similar data are presented for the fission reactions. In all cases the decay schemes are illustrated.

20562 **(ANL/NESC—278) WHAM6; liquid-filled piping system analysis.** Berta, V.T. (EG and G Idaho, Inc., Idaho Falls (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048278.

Maxima of100 legs 50 nodes per leg 2 different valves or breaks (additional ones have the properties of the second one) 4 pumps 1 pressurizer 1 case per execution The limits of 100 legs and 50 nodes per leg are imposed by DIMENSION and DATA statements, and can be changed to accommodate other models whenever memory space is available. Applications using 244 legs, 26 nodes per leg, for the hydraulic model have been completed at EG and G. Turbine operation range is not considered because it is assumed that each pump is provided with a check valve.

WHAM6 is used to calculate pressure and velocity transients in liquid-filled piping networks. It can be applied to multiloop complex piping networks consisting of dead ends, elbows, orifices, multiple-branch tees, changes of flow passage cross section, check valves, pumps, pressurizers or tanks, and exit valves or breaks. Hydraulic losses are considered. Transients can be initiated either by closure or opening of one or more exit valves (equivalent to system ruptures) or by a prescribed gas pressure history in a pressurizer tank.IBM360,370;CDC6600,7600; FORTRAN IV and BAL (IBM360), FORTRAN IV (CDC7600); OS/360,370 (IBM360,370), SCOPE 2.1.3 (CDC7600); 480K bytes of memory (IBM370/195), 101,000 (octal) words (CDC7600).

20563 **(ANL/NESC—284R) M0555;ACT1; loss-of-coolant accident analysis.** Fuls, G.M. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048284.

There are three regular inflow tables, one table for spray flow, 20 heat sinks, two linear and one log-log heat input tables, and two special inflow tables for FLASH output.

This program will predict the pressure transient in the containment vessel as a function of time as a result of a major rupture in the primary system of a pressurized water reactor. Means are available for introducing water and heat into the containment vessel. There are also provisions for specifying various types of heat sinks for energy absorption. The temperature distribution in these heat sinks is calculated as a function of time. Discharge rates of the containment may also be determined as a function of both time and the internal pressure.CDC6600; FORTRAN IV; SCOPE 2.0.

20564 **(ANL/NESC—295R) FLASH3; loss-of-coolant accident analysis.** Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Davis, V.C. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048295.

The reactor plant must be represented by 20 or less pressure-determining nodes and 40 or less flow paths. The plant and core geometry are assumed fixed in time. Hence, the solution is not applicable after significant core melting.

FLASH3 determines the transient response of a water-cooled reactor to a loss-of-coolant accident or severe variable pressure operation.CDC6600; FORTRAN IV; SCOPE 3.1; 64K memory.

20565 **(ANL/NESC—299R) LION4;LION; three-dimensional temperature distribution program.** Binney, E.J. (Knolls Atomic Power Lab., Schenectady, NY (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048299.

LION4 is a computer program for calculating one-, two-, or three-dimensional transient and steady-state temperature distributions in reactor and reactor plant components. It is used primarily for thermal-structural analyses. It utilizes finite difference techniques with first-order forward difference integration and is capable of handling a wide variety of bounding conditions. Heat transfer situations accommodated include forced and free convection in both reduced and fully-automated temperature dependent forms, coolant flow effects, a limited thermal radiation capability, a stationary or stagnant fluid gap, a dual dependency (temperature difference and temperature level) heat transfer, an alternative heat transfer mode comparison and selection facility combined with heat flux direction sensor, and any form of time-dependent boundary temperatures. The program, which handles time and space dependent internal heat generation, can also provide temperature dependent material properties with limited non-isotropic properties. User-oriented capabilities available include temperature means with various weightings and a complete heat flow rate surveillance system.CDC6600,7600;UNIVAC1108;IBM360,370; FORTRAN IV and ASCENT (CDC6600,7600), FORTRAN IV (UNIVAC1108A,B and IBM360,370); SCOPE (CDC6600,7600), EXEC8 (UNIVAC1108A,B), OS/360,370 (IBM360,370); The CDC6600 version plotter routine LAPL4 is used to produce the input required by the associated CalComp plotter for graphical output. The IBM360 version requires 350K for execution and one additional input/output unit besides the standard units.

20566 (ANL/NESC—330) ECCSA4; **loss-of-coolant & emergency cooling.** Cudnik, R.A. (Battelle Columbus Labs., OH (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048330.

The fuel rod can be represented by up to 11 radial nodes and 24 axial segments. Each axial segment has associated with it an equivalent axial segment of the fluid channel surrounding the fuel rod. Thus a maximum of 24 axial segments in the flow channel is allowed.

ECCSA4 predicts the thermal and hydraulic behavior of a single fuel rod and its associated core flow channel during a loss-of-coolant accident and subsequent emergency core cooling injection.CDC6400; FORTRAN IV; SCOPE 3.3; 110K octal memory, one tape for restart capability, one tape for plotting data if desired..

20567 (ANL/NESC—391R) SORSDB; **pressure vessel stress and fatigue.** Carlson, F.C.; Dobson, R.E. (Knolls Atomic Power Lab., Schenectady, NY (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048391.

As many as 100 points on the vessel may be evaluated for a maximum of 15 operating conditions and 50 fatigue cycles.

SORSDB was written to calculate the stress intensities and fatigue usage factors for pressure vessels (structural members) in accordance with the ASME Code, Nuclear Vessels, Section 3. The input requires the basic membrane and bending stresses generated by the SOR2 code (NESC Abstract 80) or any adaptable shell program. The output includes stress differences, stress intensities, and fatigue usage factors.CDC6600; FORTRAN IV.

20568 (ANL/NESC—395) FLAC; **steady-state flow, pressure distribution.** Malek, G.J. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048395.

The FLAC program does not consider two-phase flow or open-channel flow, as in hydraulics.

The flow analysis code FLAC calculates the steady-state flow and pressure distribution in an arbitrary network. The program includes the possibility of heat addition and mass addition in any portion of the network.UNIVAC1108;IBM370;CDC6600; FORTRAN V (UNIVAC1108) and FORTRAN IV (IBM370 and CDC6600); EXEC2 (UNIVAC1108), OS/370 (IBM370), SCOPE (CDC6600); The computer storage requirements for FLAC are flexible, and the size of the various arrays can be adjusted to suit any problem. With all arrays set to their maximum, a problem consisting of 1500 branches and 700 nodes requires approximately 50,000 storage locations on the UNIVAC1108. 180K bytes of memory are needed for the IBM370 version and 72,000 (octal) words of memory are required for the CDC6600 version..

20569 (ANL/NESC—433) CONTEMPT-LT/028;CONTEMPT-LT/026; **pressure-temperature response.** Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Cheng, T. [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048433.

Maxima of - 20 heat conducting structures 101 mesh points for each structure 20 regions for each structure 50 flow elements in one segment of the horizontal vent pressure suppression system 10 horizontal vents (or branches) in a segment 50 reductions within an input time-step CONTEMPT-LT can be used for analyzing the transient containment behavior of boiling-water reactors (BWRs) including Mark I, Mark II, and Mark III systems; pressurized-water reactors (PWRs), and experimental water reactor simulators or related experiments.

CONTEMPT-LT was developed to predict the long-term behavior of water-cooled nuclear reactor containment systems subjected to postulated loss-of-coolant accident (LOCA) conditions. CONTEMPT-LT calculates the time variation of compartment pressures, temperatures, mass and energy inventories, heat structure temperature distributions, and energy exchange with adjacent compartments. The program is capable of describing the effects of leakage on containment response. Models are provided for fan cooler and cooling spray engineered safety systems. One to four compartments can be modeled, and any compartment except the reactor system may have both a liquid pool region and an air-vapor atmosphere region above the pool. Each region is assumed to have a uniform temperature, but the temperatures of the two regions may be different. The user determines the compartments to be used, specifies input mass and energy additions, defines heat structure and leakage systems, and prescribes the time advancement and output control.CDC7600,CYBER176;IBM360; FORTRAN IV and COMPASS (CDC7600), FORTRAN IV and BAL (IBM360); SCOPE 2.1 (CDC7600), OS/MVT (IBM360); 58K (octal) bytes and a CalComp or microfilm plotter (CONTEMPT-LT/028); 430K bytes and a CalComp or SC4060 plotter for graphical output (CONTEMPT-LT/026).

20570 (ANL/NESC—503R) DUZ2; **2-dimensional axisymmetric and plane elastic-plastic.** Peterson, W.D.; Jeffrey, C. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048503.

The program provides for up to 99 regions, to describe material properties and boundary conditions. There may be up to 5000 points in a rectangular array, with at most 250 mesh rows or columns. Because of the initial strain method, plastic strains should not be significantly larger than elastic strains.

DUZ2 performs two-dimensional elastic-plastic stress calculations. The program treats axially symmetric bodies or plane regions (plane stress or plane strain) assuming deformation theory. Loading conditions may be a non-uniform temperature distribution, body forces, and boundary displacements or stresses.CDC6600; Although the program is written primarily in FORTRAN IV, certain inner loop routines were optimized using COMPASS. Also, the program calls on COMPASS routines which are a part of the Bettis computing environment.; SCOPE 3.1; The program was written for a CDC6600 with a central memory size of at least 64K, reader, printer, a system disk and 4 non-system disks each on its own channel. The program makes optional use of extended core storage and CDC-280 microfilm output.

20571 (ANL/NESC—542) PSA2; **stress analysis multianchor pipe system.** Nickols, A.N. (Atomics International Div., Canoga Park, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048542.

Maximum of - 36 sections.

PSA2 computes the reactions and stresses caused by thermal expansion and loads in a multi-anchor piping system which may contain loops and may be partially restrained at any point in any direction.IBM360,370; FORTRAN IV (H); OS/360; 64K memory.

20572 (ANL/NESC—853) **SURGTANK; reactor steam surge tank dynamics.** Gorman, D.J.; Gupta, R.K. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048853.

The program was developed for predicting pressure behavior in vertical axis cylindrical tanks with spherical dome caps. It could be readily adapted to other geometries, such as spherical tanks (reference 2). Back-to-back insurges and outsurges cannot be treated since each must start from equilibrium conditions. The analysis does not include the effects of heaters, sprays, and safety valves. Possible modifications to include effects of sprays are discussed in reference 5.

SURGTANK generates the steam pressure, saturation temperature, and ambient temperature history for a nuclear reactor steam surge tank (pressurizer) in a state of thermodynamic equilibrium subjected to a liquid insurge described by a specified time history of liquid levels. It is capable also of providing the pressure and saturation temperature history, starting from thermodynamic equilibrium conditions, for the same tank subjected to an outsurge described by a time history of liquid levels. Both operations are available for light- or heavy-water nuclear reactor systems. The tank is assumed to have perfect thermal insulation on its outer wall surfaces.IBM360,370; FORTRAN IV; OS/360 (IBM360), OS/370 (IBM370); 110K bytes of storage for the insurge problem and 92K bytes of storage for the outsurge problem.

20573 (ANL/NESC—898) **OCTAVIA; pressure vessel failure probabilities.** Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Goldberg, F.F. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048898.

Maxima of - 100 temperatures 12 fluences 8 flaw sizes with the program's current dimensioning. Only axially oriented flaws in the vessel beltline are considered.

OCTAVIA (Operationally Caused Transients And Vessel Integrity Analysis) calculates the probability of pressure vessel failure from operationally-caused pressure transients which can occur in a pressurized water reactor (PWR). For specified vessel and operating environment characteristics the program computes the failure pressure at which the vessel will fail for different-sized flaws existing in the beltline and the probability of vessel failure per reactor year due to the flaw. The probabilities are summed over the various flaw sizes to obtain the total vessel failure probability. Sensitivity studies can be performed to investigate different vessel or operating characteristics in the same computer run.IBM370,303x; FORTRAN IV; OS/370; OCTAVIA requires approximately 170K bytes of storage for execution of the sample problem on an IBM370/195 or 3033.

20574 (NUREG/CP—0036) **Proceedings of the workshop on nuclear-power-plant aging.** Bader, B.E.; Hanchey, L.A. (comps.). (Sandia National Labs., Albuquerque, NM (USA)). Nov 1982. Contract AC04-76DP00789. 288p. (SAND—82-2264C; CONF-820876—). NTIS, PC A13/MF A01 - GPO. Order Number DE83003875.

From Workshop on nuclear power plant aging; Bethesda, MD, USA (4 Aug 1982).

The Nuclear Regulatory Commission (NRC) organized the workshop on Nuclear Power Plant Aging held August 4-5, 1982 in Bethesda, Maryland, to facilitate an exchange of thoughts between the NRC and industry on the subject of time-related degradation and its influence on reactor safety. The workshop objectives were to define the problem, to discuss the state of knowledge on aging phenomena, and to identify future activities necessary to understand the problem. The theme of the workshop was Where We Are Today and What Should We Be Doing.

20575 (NUREG/CP—0036, pp 19-22) **Effect of aging on the performance of safety-related equipment.** Gleason, J.F. (Wyle Labs., Huntsville, AL). Nov 1982. NTIS, PC A13/MF A01 - GPO.

From Workshop on nuclear power plant aging; Bethesda, MD, USA (4 Aug 1982).

The nuclear power industry has made a concentrated effort to include in the qualification of safety-related equipment the concept of aging. This paper discusses the general philosophy of the inclusion of aging concepts, the application of those concepts into equipment qualification test efforts, and the results of aging on the operability of this equipment.

20576 (NUREG/CP—0036, pp 23-28) **Accelerated aging methods of electrical equipment at Electricite de France.** Roubault, J. (Electricite de France, Cedex). Nov 1982. NTIS, PC A13/MF A01 - GPO.

From Workshop on nuclear power plant aging; Bethesda, MD, USA (4 Aug 1982).

The nuclear safety requirements for class IE electrical equipment imply the simulation of natural aging in qualification test programs. Such requirements quite agree with E.D.F. practice of qualification tests in order to show aptitude to long-life service of conventional equipment for electrical generation and supply. Such procedures, whose elaboration needs sometimes up to five years, have now the benefit of enough experience to appreciate their effectiveness. From another standpoint, class IE equipment is often identical or similar to conventional equipment. For these reasons, E.D.F. tended towards the use of its conventional aging procedures or of similar ones. Such procedures are actually used for equipment that does not have to function during a loss-of-coolant accident (LOCA) or main steam link break (MSLB).

20577 (NUREG/CP—0036, pp 29-41) **Equipment aging: an overview of status and research needs.** Carfagno, S.P. (Franklin Research Center, Philadelphia, PA). Nov 1982. NTIS, PC A13/MF A01 - GPO.

From Workshop on nuclear power plant aging; Bethesda, MD, USA (4 Aug 1982).

The problem of equipment aging in nuclear power generating stations is viewed from the standpoint of the qualification of safety-related equipment. A brief summary of developments related to equipment aging and qualification (in industry, the regulatory arena, and in the research area) is presented to focus on the current status of the problem. Several research topics are suggested for consideration as components of any general plan of research on plant aging. Among these is a topic concerned with an effort to establish the relative merit of different approaches to account for the functional degradation of equipment in terms of their cost and their contribution to assurance of public safety and a topic to investigate ways to improve the monitoring of functional degradation of equipment in service. Some factors to be considered in choosing among research topics and in establishing funding levels are mentioned.

20578 (NUREG/CP—0036, pp 42-50) **Methodology for estimating remaining life of components using multifactor accelerated life tests.** Thomas, R.E.; Gaines, G.B.; Epstein, M.M. (Battelle Columbus Labs., OH). Nov 1982. NTIS, PC A13/MF A01 - GPO.

From Workshop on nuclear power plant aging; Bethesda, MD, USA (4 Aug 1982).

Accelerated life tests are recommended for estimating the remaining service life of complex, service-aged components. The multifactor life tests are developed by a select team of scientists with 4 to 6 man-months of effort in accord with a set of agendas described in the paper. Factorial tables, hierarchical trees, and associated mathematical models are used to guide the efforts of the design team in obtaining an experimental design that is scientifically and statistically defensible.

20579 (NUREG/CP—0036, pp 59-78) **Condition monitoring.** Wanless, J.W. (NUS Corp., Menlo Park, CA). Nov 1982. NTIS, PC A13/MF A01 - GPO.

From Workshop on nuclear power plant aging; Bethesda, MD, USA (4 Aug 1982).

This paper presents an alternative method for addressing aging of equipment in nuclear power plants. Condition monitoring is the term used for an empirical surveillance technique by which the damage caused by environmental stress imposed on equipment is periodically assessed. The assessment of existing damage versus the undamaged and failed conditions allows for extrapolation of remaining life. A discussion of currently used Arrhenius and statistical techniques used to calculate useful life and their relationship to condition monitoring is given in the paper. A simple example of the condition monitoring method and the advantages of the method are discussed.

20580 (NUREG/CP—0036, pp 81-89) **Functional qualification of mechanical components and considerations for aging problems.** Brown, E.J. (Nuclear Regulatory Commission, Washington, DC). Nov 1982. NTIS, PC A13/MF A01 - GPO.

From Workshop on nuclear power plant aging; Bethesda, MD, USA (4 Aug 1982).

This paper provides a review of functional qualification and considerations for aging for pumps and valves used in commercial nuclear power plants. This multipurpose paper provides an overview of the status of qualification standards for pumps and valves and how aging is being considered; provides a discussion of qualification approaches; gives examples of aging of valves; and offers some suggestions for progress in the future.

20581 (NUREG/CP—0036, pp 90-106) **Operation testing and maintenance approach to aging problems in mechanical components.** Beatty, D. (Burns & Roe, Inc., Orabell, NJ). Nov 1982. NTIS, PC A13/MF A01 - GPO.

From Workshop on nuclear power plant aging; Bethesda, MD, USA (4 Aug 1982).

The ASME Committee on Operation and Maintenance of Nuclear Power Plant Components recognizes the importance of aging and degradation to mechanical equipment which must operate to perform a safety function to nuclear power plants. The approach taken by the Committee in developing standards is primarily one of inservice testing and preventative maintenance coupled with qualification and production testing of components. This paper describes the approach taken by the ASME Committee on Operation and Maintenance of Nuclear Power Plant Components in developing requirements to detect, evaluate and control aging problems in mechanical components.

20582 (NUREG/CP—0036, pp 121-130) **Overview of synergistic aging effects.** Steigelmann, W.; Farber, M. (Synergic Resources Corp., Bala Cynwyd, PA). Nov 1982. NTIS, PC A13/MF A01 - GPO.

From Workshop on nuclear power plant aging; Bethesda, MD, USA (4 Aug 1982).

Proper, technically defensible qualification of materials and equipment for nuclear power facilities requires that the effects of combined environment exposures be addressed. The full significance of synergistic effects resulting from combined stresses still remains largely an unknown to be provided for by use of conservatisms, allowing a sizeable margin in test programs and analyses to account for possible combined effects. However, these margins, when applied to sequential aging tests, may under- or over-estimate the qualified life of the material or equipment. Experimentation with radiation dose-rate effects, simultaneous vs. sequential ordered exposures, and other combined environment testing are highlighted in this paper to provide an overview of the current state-of-knowledge concerning synergistic effects and their significance to qualification programs.

20583 (NUREG/CP—0036, pp 131-136) **State regulator views the aging of nuclear power plants.** Keating, J.B. (New York State P.S.C., Albany). Nov 1982. NTIS, PC A13/MF A01 - GPO.

From Workshop on nuclear power plant aging; Bethesda, MD, USA (4 Aug 1982).

This report provides the author's views of the current status of operating nuclear power plants as they are affected by replacement or major repairs of large components. Opinions expressed in this report are subjective, based on the author's experience with regulation of utility companies in New York State. Costs associated with long outages required for replacement of major components are mentioned, as well as areas where attention should be given to help achieve forty years of design life for nuclear plants.

20584 (NUREG/CP—0036, pp 142-146) **Maintaining qualified life of equipment and parts in nuclear power plants.** Agnihotri, N.K. (Equipment Qualification Engineering Services, Inc., Lombard, IL). Nov 1982. NTIS, PC A13/MF A01 - GPO.

From Workshop on nuclear power plant aging; Bethesda, MD, USA (4 Aug 1982).

This paper describes certain approaches which may extend the available qualified life of an item (the term item is used to designate an item of equipment or a part of an equipment item) during storage or during in plant service. These approaches include: reduction of the time period between manufacturing an item and supplying it to the plant, and reforming of items in storage. The use of existing information available in the industry standards and sharing of results of qualification test efforts among various users are emphasized. The purpose of this paper is to invite industry's attention to the need for coordination in the existing qualification test and analysis efforts. The paper aims at initiating additional research efforts needed to provide directions to ensure maintenance of qualified life.

20585 (NUREG/CP—0036, pp 147-164) **Impact of preconditioning on the qualification of safety-related equipment.** Isgro, J.R. (Gibbs & Hill, Inc., New York, NY). Nov 1982. NTIS, PC A13/MF A01 - GPO.

From Workshop on nuclear power plant aging; Bethesda, MD, USA (4 Aug 1982).

This paper shares some recent experiences on the effects of preconditioning on the qualification of safety-related equipment not located in a harsh environment. Environmental and seismic qualification testing programs were conducted following the guidelines of IEEE 323-1974, IEEE 344-1975 and appropriate IEEE daughter standards, where available. The examples that follow will illustrate the degree of pre-conditioning of safety-related equipment qualified to the requirements of IEEE-323-1974, and its effect on the outcome of the qualification program.

20586 (NUREG/CP—0036, pp 165-175) **Equipment qualification maintenance.** Scates, R.M. (Wyle Labs., Huntsville, AL). Nov 1982. NTIS, PC A13/MF A01 - GPO.

From Workshop on nuclear power plant aging; Bethesda, MD, USA (4 Aug 1982).

Over the past few years, the nuclear power industry has devoted a great deal of attention to achieving equipment qualification. As this goal approaches, the attention of prudent utilities is now being directed toward maintaining that qualification throughout the useful life of the equipment. This paper presents a Qualification Maintenance Program (QMP) which is designed to meet the Nuclear Regulatory Commission requirements for ongoing qualification maintenance of safety-related equipment.

20587 (NUREG/CP—0036, pp 190-202) **Comments on the prediction of service lives of polymeric materials by the Arrhenius methods.** Brown, M. (E.I. Du Pont de Nemours Co., Wilmington, DE). Nov 1982. NTIS, PC A13/MF A01 - GPO.

From Workshop on nuclear power plant aging; Bethesda, MD, USA (4 Aug 1982).

In recent years the Arrhenius equation has been incorporated into certain important performance specifications in order to predict the long-term performance characteristics of polymeric materials. Furthermore, Underwriters' Laboratory has used the technique for many years to determine a so-called temperature rating for polymerics. This discussion is intended to clarify the theoretical and experimental bases for the Arrhenius equation and to discuss its applicability to the question of polymer aging.

20588 (NUREG/CP—0036, pp 203-214) **Brief overview and comparison of thermal aging models used for power plant equipment qualification.** Chamow, M.F. (Gilbert Associates, Inc., Reading, PA). Nov 1982. NTIS, PC A13/MF A01 - GPO.

From Workshop on nuclear power plant aging; Bethesda, MD, USA (4 Aug 1982).

Some of the confusion that often accompanies conversions or comparisons among the various thermal aging models used for power plant equipment qualification evaluations is alleviated by the methods described in this paper. Specifically, an Arrhenius-based model is examined and compared with relatively more approximate models, such as the so-called ten-degree rule and other representations of aging acceleration found in test reports and technical literature. Based on the comparisons performed, useful conversions are developed, and are presented as formulas, tables, and graphs.

20589 (NUREG/CP—0036, pp 215-216) **EPRI-sponsored correlation of age-sensitivity and seismic qualification.** Gleason, J.F. (Wyle Labs., Huntsville, AL). Nov 1982. NTIS, PC A13/MF A01 - GPO.

From Workshop on nuclear power plant aging; Bethesda, MD, USA (4 Aug 1982).

The Electric Power Research Institute (EPRI) has sponsored research by Wyle Laboratories into the correlation between age-sensitivity and the seismic performance of safety-related equipment. The purpose of the research is to analytically and experimentally evaluate the correlation between the effects of thermal aging and operational cycling on the ability of selected electronic and electrical components to perform in a seismic environment. The results of this research provide the technical justification for exempting from aging, prior to seismic testing those component types for which it has been demonstrated that no significant aging and seismic coupling exists. This paper discusses the aging mechanisms which were simulated, the components which were tested, the seismic testing performed and the conclusions of this series of testing.

20590 (NUREG/CP—0036, pp 217-228) **Case for non-material specific thermal aging.** Bessey, R.L. (Southwest Research Inst., San Antonio, TX). Nov 1982. NTIS, PC A13/MF A01 - GPO.

From Workshop on nuclear power plant aging; Bethesda, MD, USA (4 Aug 1982).

The state-of-the-art model for accelerated thermal aging of components prior to seismic testing is the Arrhenius Model. The most pertinent independent variable in the equation is the minimum activation energy constant characterizing the component aging. With minor exceptions, existing measured values of the activation energy constant are inadequate as input to the model where a material specific aging acceleration factor is to be determined, for reasons described. The model itself is not very accurate. A case is made for a statistically justified minimum activation energy constant which is not material specific. The advantages of this are assessed. The major advantage is that this would provide the industry with a practical and uniform aging method that is consistent with the accuracy of the model.

20591 (NUREG/CP—0036, pp 231-242) **Considerations in the thermal aging analysis of safety-realted power equipment.** Lieberman, P.; Wood, S.H. (National Technical Systems, Alexandria, VA). Nov 1982. NTIS, PC A13/MF A01 - GPO.

From Workshop on nuclear power plant aging; Bethesda, MD, USA (4 Aug 1982).

There are several approaches to aging analysis in the qualification of nuclear power plant equipment in accord with IEEE and NRC standards and regulations. The importance of analysis as a technique in the aging step of nuclear environmental qualification results from the fact that industry is frequently faced with limited time to qualify a nuclear component or system, inadequate budgeted funding to perform an elaborate test program, and equipment that is already in place and in service that is required to meet new regulatory requirements. Full utilization of the analysis approaches to aging will assist the nuclear power industry in solving many of its problems in meeting these new requirements.

20592 (NUREG/CP—0036, pp 256-262) **Effects of simultaneous exposures to heat and radiation on insulation life.** Campbell, F.J. (Naval Research Lab., Washington, DC). Nov 1982. NTIS, PC A13/MF A01 - GPO.

From Workshop on nuclear power plant aging; Bethesda, MD, USA (4 Aug 1982).

The capability for predicting service life of an insulating material from test procedures based upon thermal aging alone becomes much more complex when the aging is conducted in an environment of heat and radiation combined. The life of an insulating material which will be used in radiation environment cannot be predicted by the usual thermal-aging methods; neither can it be predicted from experiments in which thermal aging follows a pre-exposure to radiation at room temperature, or vice versa. To have any reliable significance, the experiment must be conducted in a combined environment of both heat and radiation. At the Naval Research Laboratory an apparatus has been designed and used to achieve this exposure condition. Initial studies with this facility have demonstrated that in environments combining radiation with high temperatures, the life of magnet wire insulating materials is far different from that obtained in individual environments or from sequential exposures to each environment. Each material is affected differently, with some showing an accelerated degradation while others have a longer life in some environmental combinations.

20593 (NUREG/CP—0036, pp 263-268) **Aging of electrical equipment.** Bernstein, B.S. (Electric Power Research Inst., Washington, DC). Nov 1982. NTIS, PC A13/MF A01 - GPO.

From Workshop on nuclear power plant aging; Bethesda, MD, USA (4 Aug 1982).

Approaches employed to attempt to predict the life of electrical equipment out to 40 years, in a nuclear environment, are compared to what the Electrical Systems Division of the Electric Power Research Institute is facing with respect to high voltage cables and power transformers. Discussion includes where the Arrhenius relationship is valid, why it is not valid in most (but not all) cases relating to equipment aging, and how alternate approaches to life prediction are developed.

20594 (NUREG/CR—2878) **Detection of small-sized near-surface under-clad cracks for reactor pressure vessels.** Taylor, T.T.; Crawford, S.L.; Doctor, S.R.; Posakony, G.J. (Pacific Northwest Lab., Richland, WA (USA)). Feb 1983. Contract AC06-76RL01830. 31p. (PNL—4373). NTIS, PC A03/MF A01 - GPO $4.50. Order Number DE83008557.

The analysis of pressurized thermal shock (PTS) shows it is necessary for nondestructive evaluation to demonstrate high probability of detecting evaluation to demonstrate high probability of detecting cracks 0.250 inches deep and deeper at the clad/base metal interface. Ultrasonic techniques developed and used in Europe are evaluated in this paper for their applicability to US reactor pressure vessels for detecting cracks of interest for PTS. Flaw detectability experiments were carried out by testing the inspection technique's ability to detect artificial flaws under several types of clad, including some Manual Metal Arc (MMA) clad. Both ground and unground clad surfaces were evaluated. Crack sizing tests of the inspection technique were made using a crack tip diffraction technique.

20595 **Reactor component automatic grapple.** Greenaway, P.R. (to Dept. of Energy). US Patent 4,362,692. 7 Dec 1982. Filed date 3 Nov 1980. vp.

PAT-APPL-203307.

A grapple for handling nuclear reactor components in a medium such as liquid sodium which, upon proper seating and alignment of the grapple with the component as sensed by a mechanical logic integral to the grapple, automatically seizes the component. The mechanical logic system also precludes seizure in the absence of proper seating and alignment.

20596 **Heat transfer system.** Mcguire, J.C. (to Dept. of Energy). US Patent 4,343,763. 10 Aug 1982. Filed date 7 Mar 1980. vp.

PAT-APPL-128203.

A heat transfer system for a nuclear reactor is described. Heat transfer is accomplished within a sealed vapor chamber which is substantially evacuated prior to use. A heat transfer medium, which is liquid at the design operating temperatures, transfers heat from tubes interposed in the reactor primary loop to spaced tubes connected to a steam line for power generation purposes. Heat transfer is accomplished by a two-phase liquid-vapor-liquid process as used in heat pipes. Condensible gases are removed from the vapor chamber through a vertical extension in open communication with the chamber interior.

2203 Fuel Elements

20597 **(ANL/NESC—256) MANTA; steady-state thermal-hydraulic analysis.** Stedwell, M.J. (General Electric Co., San Jose, CA (USA). Nuclear Energy Div.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048256.

Maxima of - 200 nodes 1 to 100 internal nodes 101 to 150 surface nodes 48 coolant nodes 24 coolant channels 20 segments 6 connections per node except for the coolant nodes which have 5; .

MANTA is a program which provides a thermal-hydraulic nodal analysis in the steady state. It was designed to analyze fuel element configuration in the superheat development program. MANTA analyzes mixing between coolant channels, allows for temperature variant conductivity in admittance calculations, and multiple stacked segments through the fuel region for a 7-element cluster analysis over a length of up to 8 feet. MANTA is designed for single-pass steam flow. The flow direction in the coolant channels may be either up or down, thereby permitting the analysis of two-pass as well as single-pass fuel elements. MANTA accounts for the heat transfer and pressure drop that may occur between coolant channels due to mixing as well as to the conventional heat transfer and pressure drop relationships due to friction, discontinuities, acceleration, convection, conduction, and radiation. MANTA allows for the calculation at each node of the material properties viscosity, specific heat, conductivity, and specific volume to correspond to the actual node temperature being solved for. The CDC6600 version uses sodium for the working fluid rather than steam.GE635;CDC6600,7600; FORTRAN IV; GECOS (GE635) and SCOPE (CDC6600); 35K GE635, with 3 scratch tapes.

20598 **(ANL/NESC—257) REAX; resolved resonance epithermal cros sectionss.** Protsik, R. (General Electric Co., Sunnyvale, CA (USA). Advanced Products Operation). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048257.

Maxima of - 5 fuel temperatures 5 moderating materials 3 fuel isotopes 30 first fertile isotope resonances 10 second fertile isotope resonances 80 fissile isotope resonances.

REAX calculates epithermal flux, activities and cross sections as a function of radius and energy for a constant temperature fuel rod immersed in a homogeneous medium.GE635; FORTRAN IV; GE635 GECOS; 35K GE635 with input and output media.

20599 **(ANL/NESC—266R) CYGRO2; stress analysis of cylindrical fuel element.** Friedrich, C.M.; Guilinger, W.H. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048266.

CYGRO2 is used to determine stresses and strains during steady-state and transient power operation of an oxide-fueled, metal-clad rod-type fuel element in a pressurized environment. Major loading conditions include fuel swelling, fission gas and coolant pressure, clad growth and differential thermal expansion. The application for which the program has been developed is zircaloy tubes containing bulk oxide fuel. Axial and azimuthal symmetry of temperature and stresses is assumed.CDC6600; FORTRAN IV; SCOPE.

20600 **(ANL/NESC—272R) FIGRO; LWBR fuel swelling temperature study.** Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Sphar, C.D. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048272.

Each fuel zone may be subdivided into a maximum of 50 concentric equal-thickness annuli for the calculation of temperature and fuel growth (3302 cards) Sample problem (37 cards) Sample problem output (13 pages) Reference report, WAPD-TM-618, and Addenda.

FIGRO calculates the one-dimensional steady-state temperature distribution and total fuel swelling for metal-clad, axisymmetric, bulk-oxide cylindrical fuel elements. The fuel pellet may be solid, annular, or contain two radial zones. Oxide fuel thermal conductivity is a function of temperature, depletion, and porosity. Fuel swelling is a function of temperature, depletion, internal hydrostatic pressure, and fissioning rate. Fuel-clad gap conductance is a function of gas composition, temperature, and gap thickness at operating conditions. Either the clad surface flux or the temperature at the inside radius of the fuel may be specified as a boundary condition for the heat conduction equation. Thermal expansion of the fuel and cladding is accounted for. Transient temperature calculations can then be performed starting from the steady-state solution with user-specified heat generation and water temperature tables.CDC6600; FORTRAN IV; SCOPE 3.1.

20601 **(ANL/NESC—285R) RESQ2;RESQ0;DBFL; resonance integral for a hexagonal cell.** Anderson, B.L. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048285.

Resonance isotopes are lumped together with an averaged mass. Maximum number of energy points = 8001. Maximum number of isotopes = 15.

RESQ2 calculates the resonance integral in a two-dimensional, hexagonal system consisting of fuel, clad and water with a reflecting boundary condition.CDC6600; FORTRAN IV (98%) and ASCENT (2%); SCOPE 2.0; 40K memory, one tape for the library tape, one tape or disk for scratch.

20602 **(ANL/NESC—301) FREVAP6; HTGR metallic fission product release.** Pierce, V.H. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048301.

MMaxima of - isotopes 10 time intervals for time-dependent variable 49 segments (times number of isotopes) 5 different output print time steps.

The FREVAP type of code for estimating the release of longer-lived metallic fission products from HTGR fuel elements has been developed to take into account the combined effects of the retention of metallic fission products by fuel particles and the rather strong absorption of these fission products by the graphite of the fuel elements. Release calculations are made on the basis that the loss of fission product nuclides such as strontium, cesium, and barium is determined by their evaporation from the graphite surfaces and their transpiration induced by the flowing helium coolant. The code is devised so that changes of fission rate (fuel element power), fuel temperature, and graphite temperature may be incorporated into the calculation. Temperature is quite important in determining release because, in general, both release from fuel particles and loss by evaporation (transpiration) vary exponentially with the reciprocal of the absolute temperature.UNIVAC1108; FORTRAN IV; EXEC2, GAX27; 64K memory with 2 tapes (I/O).

20603 (ANL/NESC—362) WELWING; material buckling cylindrical fuel elements. Grosskopf, O.G.P. (South African Atomic Energy Board, Pretoria). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048362.

Up to 32 different materials in the fuel element may be used.

WELWING was developed to calculate the material buckling of reactor systems consisting of annular fuel elements in heavy water as moderator for various moderator to fuel ratios. The moderator to fuel ratio for the maximum material buckling for the particular system is selected automatically and the corresponding material buckling is calculated.IBM360; FORTRAN IV; OS/360.

20604 (ANL/NESC—424R) GLUB1; water-logged fuel element analysis. Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy, J.H.; Meyer, J.E. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048424.

For each metal property, up to 10 values versus temperature can be put in. If power or defect enthalpy is to be input, up to 30 values versus time can be given. Finally, in order to obtain allowable power as a function of defect diameter, up to 10 different diameters can be put in.

GLUB1 solves the waterlogging transient caused by the existence of a fuel element cladding defect during an increase in power. The power is either - case 1, put in as an arbitrary function of time, or case 2, assumed to be a series of linear ramps to a new steady-state with steeper and steeper slopes. All the geometry and metal properties are input quantities. Water properties are obtained from internal tables. Clad and fuel thermal, stress, and strain computations are performed. The output consists of internal pressure and defect flow. For case 1, the clad stress versus time is printed, and for case 2 the steady-state power value which causes clad failure is printed.CDC6600; FORTRAN IV; SCOPE; 60,000 octal locations.

20605 (ANL/NESC—432) COBRA4I; rod bundle & core thermal-hydraulics. Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Sutey, A.M. [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048432.

Using the COBRA4I code option to store variables on peripheral storage devices eliminates any practical limit as to maximum problem size. However, computer core requirements and code execution time is always a consideration when determining the complexity of the problem to be solved.

COBRA4I performs steady-state and transient thermal-hydraulic analysis of rod bundle nuclear fuel elements and cores via the subchannel analysis method.CDC6600,7600,CYBER175;CRAY1; FORTRAN IV; SCOPE (CDC6600,7600), NOS (CDC CYBER175), COS (CRAY1); 202,000 (octal) words and 4 scratch units besides the standard input/output units..

20606 (ANL/NESC—449R) CYGRO3; oxide fuel rod stress & deformation. Duncombe, E.; Friedrich, C.M. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048449.

Maximum of - 30 rings (fuel plus clad).

CYGRO3 is an extensive modification of CYGRO1 and CYGRO2. Basically the program calculates temperatures, deformation, and stresses in cladded fuel rods as a function of a history of power and coolant conditions. Axial and circumferential uniformity are assumed. Bubble growth and migration are included. The main changes from CYGRO1 and CYGRO2 are in the area of void migration, fuel cracking, clad collapse, representation of in-pile creep and clad anisotropy.CDC6600;IBM360,370; FORTRAN IV (CDC6600), FORTRAN IV and Assembly language (IBM360); SCOPE (CDC6600), OS/360,370 (IBM360,370); 140,000 (octal) words.

20607 (ANL/NESC—460R) LIFE3; mixed-oxide fuel element performance. Billone, M.C. (Argonne National Lab., IL (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048460.

The LIFE3 computer code was developed to calculate the thermal and mechanical response of mixed-oxide fuel elements in a fast-reactor environment. It incorporates a one-dimensional, steady-state heat-transfer analysis and a finite-strain-theory structural analysis based on generalized plane strain and the method of successive elastic solutions. An incremental approach is used so that temperatures, stresses, and strains can be calculated during any specified history of reactor power cycling. Fuel-cladding and sodium-cladding chemical attack is treated by a cladding wastage model. Up to six axial sections are allowed to account for axial variations in power and coolant temperature. Fuel restructuring; migration of fabricated and swelling porosities; fuel and cladding thermal expansion, elasticity, swelling, and creep; fission-gas release; and fuel cracking, crack healing, and hot pressing are included in the analysis. LIFE3 is the reference ERDA code for calculating the performance of fast breeder reactor fuel elements under normal operating conditions, including power cycling.IBM370;CDC7600; FORTRAN IV; OS/370 (IBM370), SCOPE 2.1 (CDC7600); 325K bytes of memory (IBM370/195) and 125,000 (octal) words (CDC7600) with one scratch file and one file for restart information, in addition to the system input and output units.

20608 (ANL/NESC—468R) BUBL1; fuel swelling & gas release simulation. Warner, H.R. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048468.

The current version of BUBL1 is restricted to isothermal problems with non-varying hydrostatic pressure and thermal gradient histories.

BUBL1 predicts fuel swelling and fission gas release from nuclear fuels, based on movement of fission gas bubbles in solids by a surface diffusion mechanism under the action of a thermal gradient (see reference 3). Interactions of the bubbles with dislocations and grain boundaries provide temporary trapping sites, prior to release.CDC6600; FORTRAN IV; SCOPE 3.1; 65K memory, a printer, and a plotter.

20609 (ANL/NESC—481R) BUSHL; cylindrical shell buckling collapse analysis. Thurman, A.L. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048481.

BUSHL uses only one Fourier component for the circumferential variations of the buckling displacements restricting its applicability to shells of near cylindrical shape. BUSHL is best-suited for problems where the parameter (L**2)/Rt is less than 1500 for cylinders.

BUSHL determines the load at which a finite-length shell of revolution will buckle when subjected to hydrostatic pressure, axial compression, or a combination of the two. Elastic-plastic material properties are used with deformation theory and thin-shell theory to analyze the shell. BUSHL was developed primarily for the buckling collapse analysis of zircaloy-clad oxide fuel rods.CDC6600; FORTRAN IV; SCOPE; Printer, on-line punch, plotter, and a minimum of 100,000 (octal) words storage.

20610 (ANL/NESC—931) SCORE-EVET; three-dimensional hydraulic reactor core analysis. Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Kiser, D.M. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048931.

Maxima of - 64 flow channels 40 cells in any one direction (boundary plus real cells) 40 possible loss coefficients For the fuel rod thermal transport model, five nodes are allowed in the fuel and two nodes in the cladding.

SCORE-EVET was developed to study multidimensional transient fluid flow in nuclear reactor fuel rod arrays. The conservation equations used were derived by volume averaging the transient compressible three-dimensional local continuum equations in Cartesian coordinates. No assumptions associated with subchannel flow have been incorporated into the derivation of the conservation equations. In addition to the three-dimensional fluid flow equations, the SCORE-EVET code contains a one-dimensional steady state solution scheme to initialize the flow field, steady state and transient fuel rod conduction models, and comprehensive correlation packages to describe fluid-to-fuel rod interfacial energy and momentum exchange. Velocity and pressure boundary conditions can be specified as a function of time and space to model reactor transient conditions, such as a hypothesized loss-of-coolant accident (LOCA) or flow blockage. The basic volume-averaged transient three-dimensional equations for flow in porous media are solved in their general form with constitutive relationships and boundary conditions tailored to define the porous medium as a matrix of fuel rods. By retaining generality in the form of the conservation equations, a wide range of fluid flow problem configurations, from computational regions representing a single fuel rod subchannel to multichannels, or even regions without a fuel rod, can be modeled without restrictive assumptions. The completeness of the conservation equations has allowed SCORE-EVET to be used, with modification to the constitutive relationships, to calculate three-dimensional laminar boundary layer development, flow fields in large bodies of water, and, with the addition of a turbulence model, turbulent flow in pipe expansions and tees.CDC7600,CYBER175; FORTRAN IV; SCOPE 2.1 (CDC7600), NOS 1.3 (CDC CYBER175); 200,000 (octal) words of memory are required for execution.

20611 (CONF-820360—3) Correlation between fuel structure and mechanical properties of UO_2. Blank, H.; Mandler, R.; Matzke, H.; Routbort, J.; Werner, P. (Commission of the European Communities, Karlsruhe (Germany, F.R.). European Inst. for Transuranium Elements; Argonne National Lab., IL (USA)). Oct 1982. Contract W-31-109-ENG-38. 21p. NTIS, PC A02. Order Number DE83007631.

From IAEA specialists meeting on water reactor fuel element performance computer modelling; Preston, UK (14 Mar 1982).

The relation between the structure of a UO_2 fuel and its mechanical properties are discussed and illustrated for particular types of UO_2 by measurements of fracture surface energy, hardness, fracture stress and of compressive deformation at 1870 and 1970°K. This gives the background for treating the question whether it is possible to find a simple experimental method for correlating the mechanical properties of UO_2 before irradiation with those after various irradiation histories. Hardness measurements might be such a method if combined with a detailed structural analysis and sufficient knowledge about the irradiation history.

20612 (EPRI-EL—2797-Vol.1) Probabilistic approach to stability analysis. Volume 1. Mathematical models, computing methods, and results. Final report. Anderson, P.M.; Bose, A.; Timo, K.J.; Villaseca, F.E. (Arizona State Univ., Tempe (USA). Dept. of Electrical and Computer Engineering). Jan 1983. 462p. NTIS, PC A20/MF A01. Order Number DE83901466.

The objective of this project was to investigate the application of probabilistic methods for use in power system analysis and to develop preliminary computer methods for evaluation and testing. Power system stability has traditionally been evaluated using deterministic techniques. In this method of analysis the engineer selects a particular location on the network where he places a predetermined disturbance. The disturbance is programmed to exist for a given time, usually a few cycles, and the stability program solves the system response to this particular upset. The results transient behavior will permit the engineer to determine stability or instability, but gives no information regarding the likelihood of this result. Thus, any evaluation that involves a large expenditure to prevent this given instability must be tempered by judgement regarding its probability of occurrence. This project provides a means of evaluating both the stability and its probability of occurrence. There are many problems in this step into probabilistic evaluation. One must first develop a method of describing the disturbance events (fault location, type, and duration) probabilistically, and do so within the bounds of a mathematically, rigorous framework. This has been accomplished. The second useful result that has been obtained is a probabilistic description of the power system relaying system and its performance. Finally, solution methods are presented whereby disturbances can be generated probabilistically and the probability of stability determined. The subject approached in this work is difficult and much remains to be done to provide a complete working simulation. The preliminary results, however, are encouraging.

20613 Nuclear reactor fuel assembly duct-tube-to-handling-socket attachment system. Christiansen, D.W.; Smith, B.G. (to Dept. of Energy). US Patent 4,366,116. 28 Dec 1982. Filed date 5 Mar 1981. vp.

PAT-APPL-240676.

A reusable system for removably attaching the upper end of a nuclear reactor duct tube to the lower end of a nuclear reactor fuel assembly handling socket. A transition ring, fixed to the duct tube's upper end, has an interior-threaded section with a first locking hole segment. An adaptor ring, fixed to the handling socket's lower end has an outsithreaded section with a second locking hole segment. The inside and outside threaded sections match and can be joined so that the first and second locking hole segments can be aligned to form a locking hole. A locking ring, with a locking pin, slides over the adaptor ring so that the locking pin fits in the locking hole. A swage lock or a cantilever finger lock is formed from the locking cup collar to fit in a matching groove or in the locking ring prevent the locking ring's locking pin from backing out of the locking hole.

20614 Retrievable fuel pin end member for a nuclear reactor. Rosa, J.M. (to Dept. of Energy). US Patent 4,344,914. 17 Aug 1982. Filed date 6 Aug 1980. vp.

PAT-APPL-175814.

A bottom end member on a retrievable fuel pin secures the pin within a nuclear reactor by engaging on a transverse attachment rail with a spring clip type of action. Removal and reinstallation if facilitated as only axial movement of the fuel pin is required for either operation. A pair of resilient axially extending blades are spaced apart to define a slot having a seat region which receives the rail and having a land region, closer to the tips of the blades which is normally of less width than the rail. Thus an axially directed force sufficient to wedge the resilient blades apart is required to emplace or release the fuel pin such force being greater than the axial forces on the fuel pins which occur during operation of the reactor.

20615 Nuclear reactor fuel rod attachment system. Christiansen, D.W. (to Dept. of Energy). US Patent 4,344,915. 17 Aug 1982. Filed date 17 Sep 1980. vp.

PAT-APPL-187913.

A reusable system is described for removably attaching a nuclear reactor fuel rod to a support member. A locking cap is secured to the fuel rod and a locking strip is fastened to the support member. The locking cap has two opposing fingers shaped to form a socket having a body portion. The locking strip has an extension shaped to rigidly attach to the socket's body portion. The locking cap's fingers are resiliently deflectable. For attachment, the locking cap is longitudinally pushed onto the locking strip causing the extension to temporarily deflect open the fingers to engage the socket's body portion. For removal, the process is reversed.

20616 **Elevated temperature long-term air oxidation of Inconel alloy 625.** Purohit, A.; Barth, M.M. (Argonne National Laboratory, 9700 S. Cass Avenue, Argonne, IL 60439). *Transactions of the American Nuclear Society;* **41**: 292-294(Jun 1982). (CONF-820609—).

From American Nuclear Society annual meeting; Los Angeles, CA, USA (6 Jun 1982).

2204 Control Systems

20617 **(CONF-810701—7) Utility of low-order linear nuclear-power-plant models in plant diagnostics and control.** Tylee, J.L. (EG and G Idaho, Inc., Idaho Falls (USA)). 1981. Contract AC07-76ID01570. 5p. NTIS, PC A02/MF A01. Order Number DE83008449.

From Computer simulation conference; Washington, DC, USA (15 Jul 1981).

A low-order, linear model of a pressurized water reactor (PWR) plant is described and evaluated. The model consists of 23 linear, first-order difference equations and simulates all subsystems of both the primary and secondary sides of the plant. Comparisons between the calculated model response and available test data show the model to be an adequate representation of the actual plant dynamics. Suggested use for the model in an on-line digital plant diagnostics and control system are presented.

20618 (NUREG/CP—0034-Vol.1, pp 148-161) **Control-rod parametrical studies in the framework of the PRE-RACINE and RACINE programs.** Humbert, G. (Centre d'Etudes Nucleaires, Cadarache, France); Ruelle, B.; Daguzan, G.; Stanculescu, A.; Kappler, F.; Scholtyssek, W.; Bouscavet, D.; Martini, M.; Broccoli, U. Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

A control-rod experimental program is presented. This program, established in the frame of PRE-RACINE and RACINE common DEBENE, Italian and French experiments at MASURCA facility, is still under progress at the moment. The results, limited to single central rod worth are already available. For these experiments, a parametrical approach has been used. The effects of rod worth, varied separatly by rod side, boron enrichment and core size, on experiment to calculation relative discrepancy (E-C)/C can be drawn out.

20619 (NUREG/CP—0034-Vol.1, pp 162-176) **Control-rod calculation methods and uncertainties for a power LMFBR design.** Salvatores, M. (Centre d'Etudes Nucleaires de Cadarache, Saint-Paul-Lez-Durance, France); Giacometti, C.; Palmiotti, G.; Rado, V.; Lyon, F. Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

The present paper summarizes the control-rod calculation methods used at CEA for large fast power reactor design. The standard design method and correction factors due to transport heterogeneity of the control-rod subassembly, number of energy groups and calculation mesh size effects, are defined, with their associated uncertainties.

20620 **(NUREG/CR—3103) Predictor display concepts for use in nuclear-plant control.** Venhuizen, J.R.; Griffith, J.M. (EG and G Idaho, Inc., Idaho Falls (USA)). Jan 1983. Contract AC07-76ID01570. 28p. (EGG—2235). NTIS, PC A03/MF A01 - GPO. Order Number DE83007882.

The concept of predictor displays is introduced for use in a nuclear power plant control environment. [A predictor display is defined as a display on a cathode ray tube (CRT) giving the status of a portion of the plant at some future time as predicted by computer simulation.] Properties of the predictor are given, and direct relationships between supervisory control, optimal estimation theory, and prediction are presented. Two examples of predictor displays are included: steam generator water level and primary system coolant inventory. Additional research is recommended to determine the ultimate value of predictor displays in a nuclear power plant control environment.

20621 **Nuclear reactor control column.** Bachovchin, D.M. (to Dept. of Energy). US Patent 4,343,764. 10 Aug 1982. Filed date 28 Apr 1980. vp.

PAT-APPL-144748.

The nuclear reactor control column comprises a column disposed within the nuclear reactor core having a variable cross-section hollow channel and containing balls whose vertical location is determined by the flow of the reactor coolant through the column. The control column is divided into three basic sections wherein each of the sections has a different cross-sectional area. The uppermost section of the control column has the greatest crossectional area, the intermediate section of the control column has the smallest cross-sectional area, and the lowermost section of the control column has the intermediate cross-sectional area. In this manner, the area of the uppermost section can be established such that when the reactor coolant is flowing under normal conditions therethrough, the absorber balls will be lifted and suspended in a fluidized bed manner in the upper section. However, when the reactor coolant flow falls below a predetermined value, the absorber balls will fall through the intermediate section and into the lowermost section, thereby reducing the reactivity of the reactor core and shutting down the reactor.

2205 Environmental Aspects

20622 **(ANL/NESC—172) AISITE2; parametric site requirement study.** Blaine, R.A. (Atomics International, Canoga Park, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048172.

Maxima of - 100 isotopes 20 distances 10 values of variable parameter 8 organs 4 levels of containment.

AISITE2 is largely based on methods proposed by the AEC in TID-14844 but differs in certain of the assumptions and models. The code automatically varies any one of 46 parameters such as reactor power, building leak rate, iodine clean-up rate, and halogen filter efficiency, computing the exclusion area, and low population boundary zones as functions of that parameter. The edit includes dose vs. distance data, fractional contribution by isotope group to the inhalation dose, and critical distances providing both printed and graphical data. Three models are available for fission product release with up to four levels of containment.IBM360; FORTRAN IV; OS/360; 256K bytes storage.

20623 **(NP—3901553) Fort St. Vrain Nuclear Generating Station Environmental Radiation Surveillance Program. Summary report, third and fourth quarters, July-December 1982.** Johnson, J.E. (Colorado State Univ., Fort Collins (USA)). 23 Feb 1983. 135p. Public Service Company of Colorado, 2420 W. 26th Ave., Suite 100D, Denver, CO 80211.

During the second half of 1982 the Fort St. Vrain Nuclear Generating Station produced power of 2.4 x that in the previous 6 month reporting period. The reactor did not operate during the first 3.5 months of 1982. Radioactivity released by normal effluent routes, however, was not negligible during the shut down period. This is due to scheduled clean-up and maintenance operations. A complete and detailed listing of radioactivity released by all effluent routes may be found in the Public Service Company of Colorado semi-annual Effluent Release Report to the U.S.N.R.C. When possible in this report any correlation of radioactivity in environmental samples with the effluent release data is discussed. The environmental sampling and analysis program was essentially identical to that used in the most recent reporting periods. Essentially all radioactivity data measured on this project are near background levels and, more importantly, near the minimum detectable activity (MDA) levels for each radionuclude and sample type.

20624 (ORNL/Sub—7468-13-Vol.1) Conceptual Nuclear Energy Center at Green River, Utah. Volume 1. Environmental impacts. (Science Applications, Inc., Salt Lake City, UT (USA)). Jan 1982. Contract W-7405-ENG-26. 311p. NTIS, PC A14/MF A01. Order Number DE83006838.

Information is presented concerning air resources, water resources, ecological resources, cultural resources, land uses, project description, atmospheric impacts, hydrology and water quality impacts, ecological impacts, cultural impacts, land use impacts, transmission impacts, composite impact analysis, and mitigation measures.

20625 (ORNL/SUB—7846/2) Study of a conceptual nuclear energy center at Green River, Utah. Power demand, load center assessment and transmission. Smith, D.R.; Thaik, A.; Pingel, P. (Gilbert Associates, Inc., Reading, PA (USA)). Feb 1982. Contract W-7405-ENG-26. 146p. NTIS, PC A07/MF A01. Order Number DE83006351.

This document constitutes a segment of a feasibility study investigating the ramification of constructing a nuclear energy center in an arid western region. In this phase of the study. The projected power demands and load center locations were reviewed and assessed. Alternative transmission systems were analysed and a conceptual transmission for bulk power transportation is proposed with potential line routes. Environmental impacts of the proposed transmission were also identified.

20626 (ORNL/Sub—7846/3) Study of a conceptual nuclear energy center at Green River, Utah. Site selection. (NUS Corp., San Francisco, CA (USA). Western Engineering Operations). Aug 1981. Contract W-7405-ENG-26. 82p. NTIS, PC A05/MF A01. Order Number DE83006352.

The siting requirements are described for a NEC. The methodology used, primary and secondary screening criteria and the results and conclusions are also presented. Appended to the report are detailed discussions of two siting factors, and evaluation of Nuclear Regulatory Commission (NRC) demographic siting criteria and a fatal flaw analyses for terrestrial and aquatic ecology.

20627 (ORNL/Sub—7846/12) Socioeconomic impacts: study of a conceptual nuclear energy center at Green River, Utah. Weaver, R.; Taylor, J.; Burnett, K.; Greenberg, B. (Utah Univ., Salt Lake City (USA). Bureau of Economic and Business Research). Feb 1982. Contract W-7405-ENG-26. 212p. NTIS, PC A10/MF A01. Order Number DE83006834.

This document constitutes a segment of a feasibility study investigating the ramifications of constructing a nuclear energy center (NEC) in an arid western region. In this phase of the study, the impacts on socioeconomic conditions in the surrounding communities and possible ways of financing and mitigating these impacts were examined. The general conclusion reached is that the socioeconomic impacts of a nuclear energy center in the Green River area of Southeastern Utah would not impose an absolute bar to NEC development. The economy of the NEC impact area would be substantially transformed by the NEC. In particular, Green River city itself would change from its current status as a relatively stable rural economy with an agricultural, mining, and recreation base to a major city with over 20,000 permanent relatively high income residents. The NEC, by itself, would provide a tax base more than adequate to finance required expansion of public facilities and public human service provisions.

20628 (PB—82-225046) Plume diffusion modeling: annual report to the Nuclear Regulatory Commission. (National Oceanic and Atmospheric Administration, Silver Spring, MD (USA). Air Resources Lab.). Sep 1980. 115p. NTIS, PC A06/MF A01.

After a brief summary of progress, four reports are presented as follows: Effects of Release Height on Sigma sub y and Sigma sub z, by S.R. Hanna; What Convective Scaling Does for Diffusion Data, by G.A. Briggs; Study of the Horizontal Diffusion Length, Sigma sub y, by F.A. Gifford; and Representativeness of Meteorological Observations, by C.J. Nappo.

20629 (PB—82-229287) Atmospheric releases from standardized nuclear power plants: A wind tunnel study. Fluid modeling report No. 12. Payne, A.W.; Snyder, W.H. (Environmental Protection Agency, Research Triangle Park, NC (USA). Environmental Sciences Research Lab.). Apr 1982. 72p. NTIS, PC A04/MF A01.

Laboratory experiments were conducted to simulate radiopollutant effluents released to the atmosphere from two standard design nuclear power plants. The main objective of the study was to compare the dispersion in the wake of the standardized nuclear power plants with that in a simulated atmospheric boundary layer. A large meteorological wind tunnel was used to simulate a suburban atmospheric boundary layer. The model-prototype scale was 1:300 and the roughness length was approximately 1.0 m full scale. The model boundary layer simulated full scale dispersion from ground level and elevated release points over surfaces of comparable roughness length.

20630 (PB—82-236670) The socio-environmental impacts of energy development on local user groups and water resources planning. Wisniewski, R.L.; Freudenburg, W.R. (Washington State Univ., Pullman (USA)). Oct 1981. 133p. NTIS, PC A07/MF A01.

Assessment was made of the socio-environmental impacts created by the Grays Harbor County twin nuclear power generating plants being constructed by the Washington Public Power Supply System (WPPSS), using a combination of methods. The methods included over 300 interviews conducted in the immediate vicinity of the plants, and another 300 in a comparison area of eastern Pacific County. Five major conclusions were reached: both Counties showed strong opposition to the power plants, and to nuclear power, in general; water quality issues appeared to be a major reason behind the opposition. The results of this study implied that an energy facility builder's action can have significant consequences for local and regional public opinion, which, in turn, can have significant implications for the builder. Public opinion appears to have been strongly affected by a perceived lack of competence on the part of WPPSS and by the perception that WPPSS has failed to devote adequate consideration to local preferences. Public attitudes were not predictable on the basis of economic factors alone.

2206 Research, Test, And Experimental Reactors

REFER ALSO TO CITATION(S) 19831, 20433, 20462, 20677, 20679, 20707, 20727, 20731, 22516

20631 (AD-A—119945/4) Radiation field characterization for the AFRRI TRIGA Reactor. Volume I. Baseline measurements and evaluation of calculational data. Final report 5 May 80-31 Dec 80. Verbinski, V.V.; Ferlic, K.; Cassapakis, C.C.; Daxon, E.; Hagan, W.K. (Science Applications, Inc., La Jolla, CA (USA)). 1 Jun 1981. 50p. NTIS, PC A03/MF A01.

This document summarizes the neutron spectral measurements and the neutron and gamma-ray spectral calculations for five different irradiation geometries commonly employed in biological and semiconductor radiation-damage studies: freefield in both ER1 and ER2 exposure rooms; behind a 2-inch lead wall and inside an exercise wheel; behind a 6-inch lead wall and inside a 2-inch lead cave; and at the center of a tissue-equivalent phantom located behind a 6-inch lead wall.

20632 (ANL/NESC—473R) CHIC-KIN; fast and intermediate power transients. Redfield, J.A. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048473.

Restrictions include - 1 through 20 axial sections 2 through 10 radial sections 2 through 30 mass-velocity or pressure-drop pairs 2 through 30 inlet enthalpy pairs 2 through 30 exit enthalpy pairs 2 through 30 system-pressure pairs.

CHIC-KIN treats fast and intermediate reactivity transients in a water-cooled heterogeneous nuclear reactor. The program calculates the power, temperatures, and internal pressure surges when control rod motion, inlet temperature, inlet flow, and system pressure are known functions of time. The reactor model considered is a single-pass, water-cooled core represented by a single, fuel-element-coolant-passage system with reactivity feedback to the kinetics equations.CDC6600; FORTRAN IV; SCOPE 3.1.

20633 (ANL/NESC—489) TRIFIDO; pulsed neutron source data analysis. Difilippo, F.; Pieroni, N. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Dept. de Reactores). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048489.

The code is presently restricted to 256 experimental data points (for example, those provided by a TMC multichannel analyser). This is adequate for most pulsed neutron measurements. The restriction can be easily overcome if necessary by changing a dimension card.

The code calculates the decay constant and the population of the fundamental prompt neutron mode extrapolated to initial time, using pulsed neutron experimental data. These data are the resulting time profile of the neutron density of a subcritical multiplicative assembly which is repetitively pulsed with short bursts of neutrons. The time profile is measured with an appropriate detector and recorded with a time analyser. With the calculated parameters the code determines the values of (k*beta)/L and reactivity by means of the Garelis-Russell method, and reactivities using the Gozani and Sjostrand methods.IBM360; FORTRAN IV; OS/360; 11K words of storage.

20634 (ANL/NESC—510) VIM1;VIM1X; Monte Carlo critical assembly analysis. Levitt, L.B.; Lewis, R.C. (Atomics International Div., Canoga Park, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048510.

VIM1 is restricted to critical assemblies of the plate drawer type, and the energy range must be between 10 MeV and 10 eV.

VIM1 is a Monte Carlo code designed for the analysis of fast critical experiments. It has been expressly prepared for the analysis of fast critical assemblies of the plate-drawer type such as ZPPR, ZPR-3, and ZEBRA. The library uses point cross section data, rather than multigroup constants.CDC7600;IBM360; FORTRAN IV (CDC7600), FORTRAN IV and BAL (IBM360); SCOPE 1.1 (CDC7600) and OS/360 (IBM360); 65K (decimal) fast central memory, 80K ECS, and 1 magnetic tape unit are required on the CDC7600. 650K bytes and 2 tape units are required on the IBM360.

20635 (CONF-811215—13) TREAT neutron-radiography facility. Harrison, L.J. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 7p. NTIS, PC A02/MF A01. Order Number DE83007933.

From World conference on neutron radiography; San Diego, CA, USA (7 Dec 1981).

The TREAT reactor was built as a transient irradiation test reactor. By taking advantage of built-in system features, it was possible to add a neutron-radiography facility. This facility has been used over the years to radiograph a wide variety and large number of preirradiated fuel pins in many different configurations. Eight different specimen handling casks weighing up to 54.4 t (60 T) can be accommodated. Thermal, epithermal, and track-etch radiographs have been taken. Neutron-radiography service can be provided for specimens from other reactor facilities, and the capacity for storing preirradiated specimens also exists.

20636 (CONF-820406—25) Experimental Breeder Reactor II (EBR-II) Fuel-Performance Test Facility (FPTF). Pardini, J.A.; Brubaker, R.C.; Veith, D.J.; Giorgis, G.C.; Walker, D.E.; Seim, O.S. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 10p. NTIS, PC A02/MF A01. Order Number DE83007825.

From Topical meeting on fast, thermal and fusion reactor experiments; Salt Lake City, UT, USA (12 Apr 1982).

The Fuel-Performance Test Facility (FPTF) is the latest in a series of special EBR-II instrumented in-core test facilities. A flow control valve in the facility is programmed to vary the coolant flow, and thus the temperature, in an experimental-irradiation subassembly beneath it and coupled to it. In this way, thermal transients can be simulated in that subassembly without changing the temperatures in surrounding subassemblies. The FPTF also monitors sodium flow and temperature, and detects delayed neutrons in the sodium effluent from the experimental-irradiation subassembly beneath it. This facility also has an acoustical detector (high-temperature microphone) for detecting sodium boiling.

20637 (CONF-820406—26) In-situ material-motion diagnostics and fuel radiography in experimental reactors. DeVolpi, A. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 13p. NTIS, PC A02/MF A01. Order Number DE83007807.

From Topical meeting on fast, thermal and fusion reactor experiments; Salt Lake City, UT, USA (12 Apr 1982).

Material-motion monitoring has become a routine part of inpile transient reactor-safety experiments. Diagnostic systems, such as the fast-neutron hodoscope, were developed for the purpose of providing direct time-resolved data on pre-failure fuel motion, cladding-breach time and location, and post-failure fuel relocation. Hodoscopes for this purpose have been installed at TREAT and CABRI; other types of imaging systems that have been tested are a coded-aperture at ACRR and a pinhole at TREAT. Diagnostic systems that use penetrating radiation emitted from the test section can non-invasively monitor fuel without damage to the measuring instrument during the radiographic images of test sections installed in the reator. Studies have been made of applications of hodoscopes to other experimental reactors, including PBF, FARET, STF, ETR, EBR-II, SAREF-STF, and DMT.

20638 (CONF-820649—3) Image processing and resolution restoration of fast-neutron hodoscope data. Rhodes, E.A.; DeVolpi, A. (Argonne National Lab., IL (USA)). 24 Jan 1982. Contract W-31-109-ENG-38. 22p. NTIS, PC A02/MF A01. Order Number DE83007957.

From National Computer Graphics Association conference; Anaheim, CA, USA (13 Jun 1982).

The fast-neutron hodoscope is a cineradiographic device that monitors fuel motion within thick opaque test capsules during radiation transients at the Transient Reactor Test Facility reactor which simulate accident conditions in power reactors. By means of a collimator and detector array, emissive neutron radiographic digital data is collected in time-resolved and static (scan) modes. Data is digitally reconstructed into raidographic images and used directly for quantitative analysis. Spatial resolution is adequate in most cases, but is marginal for a few experiments. Collimator repositioning, scan increment size-reduction, and deconvolution algorithms are being applied to improve resolution of existing collimators.

20639 (CONF-821104—3) Development and transfer of fuel fabrication and utilization technology for research reactors. Travelli, A.; Domagala, R.F.; Matos, J.E.; Snelgrove, J.L. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 6p. NTIS, PC A02/MF A01. Order Number DE83007729.

From 2. international conference on nuclear technology transfer; Buenos Aires, Argentina (1 Nov 1982).

Approximately 300 research reactors supplied with US-enriched uranium are currently in operation in about 40 countries, with a variety of types, sizes, experiment capabilities and applications. Despite the usefulness and popularity of research reactors, relatively few innovations in their core design have been made in the last fifteen years. The main reason can be better understood by reviewing briefly the history of research reactor fuel technology and enrichment levels. Stringent requirements on the enrichment of the uranium to be used in research reactors were considered and a program was launched to assist research reactors in continuing their operation with the new requirements and with minimum penalties. The goal of the new program, the Reduced Enrichment Research and Test Reactor (RERTR) Program, is to develop the technical means to utilize LEU instead of HEU in research reactors without significant penalties in experiment performance, operating costs, reactor modifications, and safety characteristics. This paper reviews briefly the RERTR Program activities with special emphasis on the technology transfer aspects of interest to this conference.

20640 **(CONF-821155—2) Measurements and analysis of critical assemblies for research reactors with mixed enrichments.** Deen, J.R.; Snelgrove, J.L.; Hobbs, R.W. (Argonne National Lab., IL (USA); Oak Ridge National Lab., TN (USA)). 1982. Contract W-31-109-ENG-38. 47p. NTIS, PC A03/MF A01. Order Number DE83007766.

From International meeting on research and test reactor core conversions from HEU to LEU fuels; Argonne, IL, USA (8 Nov 1982).

As part of the RERTR Program whole-core demonstration in the Ford Nuclear Reactor (FNR) at the University of Michigan, data have been obtained which will allow more extensive validation of neutronics methods for whole-core calculations of an equilibrium high-enriched-uranium (HEU) core and a fresh low-enriched-uranium (LEU) core. A series of experiments designed to provide the data needed for these validations has been performed in the Pool Critical Assembly (PCA) at the Oak Ridge National laboratory (ORNL). This paper reports the results of the measurements and of the subsequent validation calculations performed at ANL. Measurements were made on approximately 20 different critical configurations in the PCA during the period June 15 to 26, 1981. The normal PCA fuel elements contained high-enriched uranium (HEU, 93 wt% ^{235}U) while the reduced-enrichment fuel elements, obtained for irradiation testing in the Oak Ridge Research Reactor (ORR) under the fuel demonstration activity of the RERTR Program, contained either medium-enriched uranium (MEU, 45 wt% ^{235}U) or low-enriched uranium (LEU, 19.8 wt% ^{235}U).

20641 **(CONF-821155—3) Performance and fuel-cycle cost analysis of one JANUS 30 conceptual design for several fuel-element-design options.** Nurdin, M.; Matos, J.E.; Freese, K.E. (National Atomic Energy Agency, Jakarta (Indonesia). Research Centre for Nuclear Techniques; Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 20p. NTIS, PC A02/MF A01. Order Number DE83007727.

From International meeting on research and test reactor core conversions from HEU to LEU fuels; Argonne, IL, USA (8 Nov 1982).

The performance and fuel cycle costs for a 25 MW, JANUS 30 reactor conceptual design by INTERATOM, Federal Republic of Germany, for BATAN, Republic of Indonesia have been studied using 19.75% enriched uranium in four fuel element design options. All of these fuel element designs have either been proposed by INTERATOM for various reactors or are currently in use with 93% enriched uranium in reactors in the Federal Republic of Germany. Aluminide, oxide, and silicide fuels were studied for selected designs using the range of uranium densities that are either currently qualified or are being developed and demonstrated internationally. To assess the long-term fuel adaptation strategy as well as the present fuel acceptance, reactor performance and annual fuel cycle costs were computed for seventeen cases based on a representative end-of-cycle excess reactivity and duty factor. In addition, a study was made to provide data for evaluating the trade-off between the increased safety associated with thicker cladding and the economic penalty due to increased fuel consumption.

20642 **(CONF-821155—4) Comparison of calculated quantities with measured quantities for the LEU-fueled Ford Nuclear Reactor.** Bretscher, M.M.; Snelgrove, J.L. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 30p. NTIS, PC A03/MF A01. Order Number DE83007725.

From International meeting on research and test reactor core conversions from HEU to LEU fuels; Argonne, IL, USA (8 Nov 1982).

The Ford Nuclear Reactor (FNR) went critical on December 8, 1981 with 23 LEU fuel elements. Five of these 23 elements were fabricated by CERCA and the others by NUKEM. Since that time a substantial data base of experimental results for LEU cores has been accumulated by the University of Michigan FNR staff. This paper compares some of the experimental data with analytical calculations based, for the most part, on three-dimensional diffusion theory. The critical configuration, control rod worths, axial rhodium reaction rate profiles and thermal flux distributions have been calculated and compared with measurements.

20643 **(CONF-821155—5) Neutronics analysis of the proposed 25-MW leu TRIGA Multipurpose Research Reactor.** Nurdin, M.; Bretscher, M.M.; Snelgrove, J.L. (National Atomic Energy Agency, Jakarta (Indonesia). Research Centre for Nuclear Techniques; Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 34p. NTIS, PC A03/MF A01. Order Number DE83007726.

From International meeting on research and test reactor core conversions from HEU to LEU fuels; Argonne, IL, USA (8 Nov 1982).

More than two years ago the government of Indonesia announced plans to purchase a research reactor for the Puspiptek Research Center in Serpong Indonesia to be used for isotope production, materials testing, neutron physics measurements, and reactor operator training. Reactors using low-enriched uranium (LEU) plate-type and rod-type fuel elements were considered. This paper deals with the neutronic evaluation of the rod-type 25-MW LEU TRIGA Multipurpose Research Reactor (MPRR) proposed by the General Atomic Company of the United States of America.

20644 **(CONF-821155—6) KUCA critical experiments using MEU fuel (II).** Kanda, K.; Hayashi, M.; Shiroya, S.; Kobayashi, K.; Fukui, H.; Mishima, K.; Shibata, T. (Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst.). 1982. Contract W-31-109-ENG-38. 25p. NTIS, PC A02/MF A01. Order Number DE83007724.

From International meeting on research and test reactor core conversions from HEU to LEU fuels; Argonne, IL, USA (8 Nov 1982).

Due to mutual concerns in the USA and Japan about the proliferation potential of highly-enriched uranium (HEU), a joint study program was initiated between Argonne National Laboratory (ANL) and Kyoto University Research Reactor Institute (KURRI) in 1978. In accordance with the reduced enrichment for research and test reactor (RERTR) program, the alternatives were studied for reducing the enrichment of the fuel to be used in the Kyoto University High Flux Reactor (KUHFR). The KUHFR has a distinct feature in its core configuration: it is a coupled-core. Each annular shaped core is light-water-moderated and placed within a heavy water reflector with a certain distance between them.

20645 **(HEDL-TC—1904-Pt.2-Rev.1) FFTF reactor-characterization program: gamma-ray measurements and shield characterization.** Bunch, W.L.; Moore, F.S. Jr. (Hanford Engineering Development Lab., Richland, WA (USA)). Feb 1983. Contract AC06-76FF02170. 94p. NTIS, PC A05/MF A01. Order Number DE83008401.

A series of experiments is to be made during the acceptance test program of the Fast Flux Test Facility (FFTF) to measure the gamma ray characteristics of the Fast Test Reactor (FTR) and to establish the performance characteristics of the reactor shield. These measurements are a part of the FFTF Reactor Characterization Program (RCP). Detailed plans have been developed for these experiments. During the initial phase of the Characteristics Program, which will be carried out in the In-Reactor Thimble (IRT), both active and passive measurement methods will be employed to obtain as much information concerning the gamma ray environment as is practical. More limited active gamma ray measurements also will be made in the Vibration Open Test Assembly (VOTA).

20646 **(NUREG/CP—0034-Vol.1, pp 506-517) Method of monitoring subcritical reactivity during core refueling.** Ombrellaro, P.A.; Harris, R.A. (Westinghouse Hanford Co., Richland, WA). Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

The Modified Source Multiplication (MSM) technique, was used to measure core subcritical reactivity and core compoent reactivity worth during a major refueling of the Fast Flux Test Facility (FFTF) core. Measured results were compared with calculated values as a means of verifying core component changeouts during the refueling. The results demonstrate the accuracy expected from

MSM measurements and show that the technique was veyr effective in monitoring core subcritical reactivity during a refueling in whcih the neutron sources changed significantly and were not uniformly distributed.

20647 (NUREG/CP—0034-Vol.1, pp 518-532) **Energy-dependent plant protection system for the TREAT upgrade reactor.** Bhattacharyya, S.K.; Lipinski, W.C.; Rudolph, R.R.; Wade, D.C. (Argonne Natioanl Lab., IL). Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

A major upgrade of the TREAT reactor is under way to enhance significantly its transient-testing capabilities in support of the LMFBR safety program. Complex power-vs-time histories, spanning time intervals of several seconds and including a burst mode, are to be generated for experiments with up to 37, 0.027 in. diameter LMFBR test pin clusters. The need to meet demanding functional requirements within several major constraints has produced a design that has a relatively small margin between operating and damaging temperature conditions for the TREAT fuel clad. It was, therefore, necessary to design a sophisticated plant protection system that would detect reactivity insertion malfunctions soon after initiation and intercede promptly with scram action, to prevent reactor clad damage. A plant protection system with energy-dependent power level trip set points lowered worst-case clad temperatures by 180°C, as compared with the use of conventional fixed-level trip set points.

20648 (ORNL/TM—8644) **Oak Ridge Research Reactor quarterly report, July, August, and September 1982.** Corbett, B.L.; Lance, E.D. (Oak Ridge National Lab., TN (USA)). Mar 1983. Contract W-7405-ENG-26. 33p. NTIS, PC A03/MF A01. Order Number DE83008139.

The ORR operated at an average power level of 28.3 MW for 63.5% of the time during July, August, and September of 1982. The reactor was shut down on thirty-four occasions, four of which were unscheduled. Reactor downtime needed for refueling, maintenance, research, and checks was higher than normal due to additional time needed for maintenance and research work. The reactor remained available for operation 82.4% of the time. Maintenance activities, both mechanical and instrument, were essentially routine in nature with the exception of the replacement of the HN-1 facility plug.

20649 **EBR-II superheater-disassembly observations.** Penney, W.H.; Brown, H.G.; Buschman, H.W.; Rice, R.E. (Argonne National Laboratory, P.O. Box 2528, Idaho Falls, ID 83401). *Transactions of the American Nuclear Society;* **41**: 300-301(Jun 1982). (CONF-820609—).

From American Nuclear Society annual meeting; Los Angeles, CA, USA (6 Jun 1982).

2207 Plutonium And Isotope Production Reactors

REFER ALSO TO CITATION(S) 21972

20650 (ORNL/TM—8677) **High flux isotope reactor quarterly report, October through December, 1982.** Hurt, S.S.; Poteet, K.H. (Oak Ridge National Lab., TN (USA)). Mar 1983. Contract W-7405-ENG-26. 20p. NTIS, PC A02/MF A01. Order Number DE83008305.

Routine reactor operation with four end-of-cycle shutdowns, two additional scheduled shutdowns, and three unscheduled shutdowns resulted in an on-stream time of 91.5% for the quarter.

2209 Reactor Safety

REFER ALSO TO CITATION(S) 20274, 20349, 20405, 20561, 20595, 20647, 21353

20651 (AEEW-R—1508) **Degraded-core accidents: review of aerosol behaviour in the containment of a PWR.** Nichols, A.L.; Walker, B.C. (UKAEA Atomic Energy Establishment, Winfrith. Technology Div.). Sep 1981. 42p. Technology Div., AEE, Winfrith, Dorchester, Dorset, England.

Low probability-high consequence accidents have become an important issue in reactor safety studies. Such accidents would involve damage to the core and the subsequent release of radioactive fission products into the environment. Aerosols play a major role in the transport and removal of these fission products in the reactor building containment. The aerosol mechanisms, computer modelling codes and experimental studies used to predect aerosol behaviour in the containment of a PWR are reviewed. There are significant uncertainties inthe aerosol source terms and specific recommendations have been made for further studies, particularly with respect to code development and high density aerosol-fission product transport within closed systems.

20652 (ANL/NESC—265) **RSAC; radiological safety analysis program.** Richardson, L.C. (EG and G Idaho, Inc., Idaho Falls (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048265.

RSAC generates a fission product inventory from a given set of reactor operating conditions and then computes the external gamma dose, the deposition gamma dose, and the inhalation-ingestion dose to critical body organs as a result of exposure to these fission products. Program output includes reactor operating history, fission product inventory, dosages, and ingestion parameters.IBM360; FORTRAN IV and Assembly language; OS/360; 150K bytes and 1 tape drive.

20653 (ANL/NESC—443) **HAA3B; aerosol behavior lognormal model.** Otter, J. (Atomics International Div., Canoga Park, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048443.

Maxima of - 1000 time-steps in lognormal model part 42 discrete radii for leakage distribution calculations 50 leak-rate input values 50 source-rate input values Applicability has been verified for moderate concentrations in moderate-sized vessels, and for limited types of sources, only.

HAA3B was written to provide an engineering method for calculating heterogeneous aerosol behavior and transport following various hypothetical LMFBR accidents. HAA3B evaluates an approximation to the general integro-differential equation which describes aerosol behavior. The physical model includes particle generation, Brownian and gravitational agglomeration, settling, plating, and leakage for spherical particles. The approximation is the requirement that the size distribution function be lognormal.IBM370; FORTRAN IV (H); OS/370 Release 21.6; A logical unit 5 for input, unit 6 for output, unit 16 for a scratch unit, and a card punch. SC-4020 CRT coding is included as comment cards. Storage allocation is less than 150K bytes.

20654 (ANL/NESC—448R) **FLASH6;FLASH4; fully-implicit transient simulation.** Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Swartele, G.W. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048448.

In FLASH6 (FLASH 4) up to 30 (20) pressure-determining nodes and 60 flow paths are available.

FLASH6 and earlier FLASH programs are used to determine the transient response of a water-cooled reactor or hydraulic system to severe variable pressure operation. As with previous editions, FLASH6 permits the user to model the reactor plant using a flexible combination of control volumes (nodes), connecting flow paths, pumps, and steam generators. A detailed representation of the core region may be obtained by using up to 80 pressure-determining nodes within the core. The core nodes are connected in one-dimensional chains to represent up to 20 core flow paths. A one-dimensional heat conduction model with up to five radial nodes is used to represent the flow of heat from the fuel element to each core fluid node. Thermal resistance of the fuel-clad gap is continuously calculated during the transient as a function of varying gap dimension, temperature, and pressure. Thirty nodes and 60 flow paths are available to model the non-core regions of the plant.IBM360,370;CDC6600,7600; FORTRAN IV; OS/360,370 (IBM360,370), SCOPE 3.3 (CDC6600), SCOPE 1.1 (CDC7600); 250K bytes (IBM360), 144K central memory and 200K ECS or LCM memory (CDC6600 or 7600).

20655 (ANL/NESC—479) FREADM1; fast reactor core accident analysis. Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Meinhardt, W.G. (General Electric Co., Sunnyvale, CA (USA). Breeder Reactor Development Operation). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048479.

FREADM1 is restricted to accidents which initiate and propagate uniformly within annular or cylindrical coaxial core regions.

FREADM1 is a fast reactor, multichannel, accident analysis program designed to efficiently simulate a reactor transient from initiation to the point of core disassembly. Models are included for nuclear kinetics (point model), core thermo-hydraulics, voiding, fuel redistribution, failure propagation, programmed reactivity insertion, and the dynamics of primary-system coolant flow. A broad range of assumed accident initiating and propagating activities may be simulated using triggering logic included in the code.GE635; FORTRAN IV; GECOS-III; 24K memory with 3 peripheral storage units.

20656 (ANL/NESC—499) MIRAB;MIRAP; containment system iodine removal. Ritzman, R.L. (Battelle Columbus Labs., OH (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048499.

The code MIRAB is used for BWR reactors and MIRAP is for PWR reactors. The codes calculate the removal of fission product iodine from a dry-type BWR/PWR containment system atmosphere under reactor accident conditions. The method considers the simultaneous removal by natural deposition on surfaces or absorption in water, by engineered spray system operation, by adsorption on filters, and by leakage from the containment. In addition, the simultaneous behavior of three iodine forms is modeled - specifically elemental iodide, methyl iodine, and particulate iodine. The programs generate iodine concentrations and accumulations throughout the containment system as a function of time after start of the accident.CDC6400; FORTRAN IV; SCOPE 3.3; Each code uses 42K (octal) memory, card reader, line printer, and one tape.

20657 (ANL/NESC—500) FRCRL2; LOCA fission product release analysis. Ritzman, R.L. (Battelle Columbus Labs., OH (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048500.

The calculation is limited to maxima of 12 fission product species, 10 radial core regions, and 11 axial core regions. Also, four separate sets of fission product diffusion parameter values must be supplied for different temperature ranges or assumed atmospheric conditions.

The code calculates the cumulative fractional release of fission products from nuclear reactor fuel under postulated loss-of-coolant accident conditions. The mathematical model for release is based on simple volume diffusion theory and the equivalent-sphere approximation of fuel porosity. Both the operational preaccident release component and the accident core thermal transient-induced release component are calculated. Detailed core temperature data are needed to make the latter set of computations. In addition, specific core power distribution factors and fission product diffusion parameters must be supplied.CDC6400; FORTRAN IV; SCOPE 3.3; 62K (octal) memory, card reader, line printer.

20658 (ANL/NESC—508) MUCHA1;MUCHA2; multiple channel analysis emergency core cooling. Cudnik, R.A. (Battelle Columbus Labs., OH (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048508.

In MUCHA1 the two fuel rods can be represented by up to a total of 15 radial nodes. Each fuel rod and its associated flow channel may be represented by up to 12 axial segments. MUCHA2 applies the same restrictions to each pair of equivalent fuel rods.

MUCHA1 predicts the thermal and hydraulic behavior of any two reactor fuel rods and their associated parallel flow channels during a loss-of-coolant accident using as boundary conditions plenum fluid conditions determined by MUCHA2 or a system-oriented code. MUCHA2 predicts the thermal and hydraulic behavior of the primary coolant within the reactor pressure vessel during a loss-of-coolant accident. The heated core is represented by two equivalent fuel rods and their associated parallel flow channels. A plenum model has been developed to predict the upper and lower plenum fluid conditions throughout the accident sequence for use as boundary conditions for the parallel core channels.CDC6400; FORTRAN IV; SCOPE 3.3; MUCHA1 requires 120K (octal) memory and one tape for restart capability. MUCHA2 requires 120K (octal) memory, one tape for restart capability, and one tape for storing plenum boundary conditions.

20659 (ANL/NESC—511) VENUS2; 2-dimensional coupled neutronics-hydrodynamics. Jackson, J.F. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048511.

VENUS2 is an improved edition of the VENUS fast-reactor disassembly program. It is a two-dimensional (r-z) coupled neutronics-hydrodynamics code that calculates the dynamic behavior of an LMFBR during a prompt-critical disassembly excursion. It calculates the power history and fission energy release as well as the space-time histories of the fuel temperatures, core material pressures, and core material motions. Reactivity feedback effects due to Doppler broadening and reactor material motion are taken into account.IBM360,370,303x;CDC7600; FORTRAN IV(H); OS/360 (IBM360) and SCOPE 2.1 (CDC7600); 440K bytes are used for the IBM version when storing the data in double-precision. Single-precision storage is adequate for the converted CDC7600 version which requires 160,000 (octal) words of memory for execution. One peripheral storage device is needed if the graphical output option is used.

20660 (ANL/NESC—518) ERREST; loss of coolant rod bundle critical heat flux data analysis. Lintner, M.A. (EG and G Idaho, Inc., Idaho Falls (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048518.

ERREST sorts the rod bundle library of critical heat flux data and performs error calculations on sorted subsets.IBM360; FORTRAN IV; OS/360; 460K bytes.

20661 (ANL/NESC—521) SOCOOL2; sodium-fuel interaction analysis. Padilla, A. (Argonne National Lab., IL (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048521.

The presence of an initial amount of sodium vapor or noncondensible gas cannot be taken into account. Time delays in the process of fragmentation and mixing of the molten material into the sodium cannot be considered. Heat transfer during the two-phase expansion of sodium is neglected.

SOCOOL2 calculates the transient temperatures, pressures, and mechanical work energy when a molten material is instantaneously and uniformly dispersed in liquid sodium which is initially under acoustic constraint.IBM360;UNIVAC1108; FORTRAN IV; CSCX (UNIVAC1108), OS/360 (IBM360); UNIVAC1108 - 19K words of memory, IBM360 - 115K bytes of memory.

20662 **(ANL/NESC—525) ORTHIS;ORTHAT; 2-dimensional heat conduction.** Durfee, R.C.; Nestor, C.W. (Oak Ridge National Lab., TN (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048525.

Maxima of - 1000 vertical nodes 1000 horizontal nodes 10000 total nodes (rows*columns) 50 vertical regions 50 horizontal regions 2500 total regions (rows*columns) 300 materials 1500 steady-state iterations 5000 transient time-steps.

ORTHIS and ORTHAT are designed to solve steady-state and transient heat conduction problems, respectively, in two-dimensional geometries. Either Cartesian (x-y) or cylindrical (r-z, r-theta) coordinate systems may be used. Thermal properties, heat generation rates, and boundary conditions may be functions of position, time, or temperature.IBM360; FORTRAN IV and BAL; OS/360; ORTHIS requires 700K, ORTHAT requires 1024K bytes.

20663 **(ANL/NESC—527) HERMES; regional radiological effects analysis.** Bentley, B.W.; Wise, K.R. (Hanford Engineering Development Lab., Richland, WA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048527.

The following are all approximate dimension restrictions - 12 time-periods (months) 50 radionuclides 200 radionuclide sources (nuclear sites) 300 receptor locations.

The HERMES model calculates the regional radionuclide releases and radiation dose to the populace in a given year arising from the operation of nuclear facilities to meet electrical generation demands within a given study region.UNIVAC1108; FORTRAN IV and SLEUTH; CSCX; 65K memory and a magnetic drum or alternative device for storage of large amounts of data.

20664 **(ANL/NESC—528) PREP;KITT; system fault tree evaluation codes.** Vesely, W.E.; Narum, R.E. (EG and G Idaho, Inc., Idaho Falls (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048528.

The PREP/KITT computer program package obtains system reliability information from a system fault tree. The PREP program finds the minimal cut sets and/or the minimal path sets of the system fault tree. (A minimal cut set is a smallest set of components such that if all the components are simultaneously failed the system is failed. A minimal path set is a smallest set of components such that if all of the components are simultaneously functioning the system is functioning.) The KITT programs determine reliability information for the components of each minimal cut or path set, for each minimal cut or path set, and for the system. Exact, time-dependent reliability information is determined for each component and for each minimal cut set or path set. For the system, reliability results are obtained by upper bound approximations or by a bracketing procedure in which various upper and lower bounds may be obtained as close to one another as desired. The KITT programs can handle independent components which are nonrepairable or which have a constant repair time. Any assortment of nonrepairable components and components having constant repair times can be considered. Any inhibit conditions having constant probabilities of occurrence can be handled. The failure intensity of each component is assumed to be constant with respect to time. The KITT2 program can also handle components which during different time intervals, called phases, may have different reliability properties.IBM360;UNIVAC1108; FORTRAN IV; OS/360 MVT (IBM360); 350K bytes on the IBM360.

20665 **(ANL/NESC—529) ANVENT; los of coolant analysis Duke Power McGuire units.** Kelly, J.L.; Krell, R.S. (Duke Power Co., Charlotte, NC (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048529.

The ANVENT program was developed to analyze thermal effects of a loss-of-coolant accident (LOCA) in a Westinghouse ice condenser nuclear unit, similar to the Duke Power Company's McGuire units. The program is capable of evaluating (1) steady-state radial temperature distributions corresponding to fixed inside and outside temperatures, (2) radial temperature distributions in the steel containment shell and the concrete reactor (shield) building during the post-LOCA transient, (3) temperature and pressure in the annulus between the containment shell and reactor building during the post-LOCA transient, and (4) capability of the annulus ventilation fan to quickly attain and maintain a vacuum in the annulus after a LOCA occurs.GE635 MARK2 Time-Sharing System; FORTRAN IV; GE635 MARK 2 Time-Sharing System.

20666 **(ANL/NESC—544) PLOT-3D; 3-dimensional plots on IBM2280 or CalComp780.** Basinger, D.; Gvildys, J. (Argonne National Lab., IL (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048544.

Versions 3 and 4 limit number of rows in arrays (x,y,z) to 100 and also number of columns in arrays (x,y,z) to 100.

PLOT-3D is a package of subprograms designed to draw three-dimensional surfaces from arrays of points (x,y,z). The surfaces can be drawn after arbitrary rotations about the three coordinate axes.IBM360/75 with an IBM2280 film recorder or a CalComp 780 plotter; FORTRAN IV; OS/360 ASP; Versions 1 and 3, for the IBM 2280 film recorder, require 7810 and 58,285 bytes of core storage, exclusive of film recorder subroutines and arrays. Versions 2 and 4, for the CalComp plotter, require 6670 and 62,435 bytes of core storage, exclusive of CalComp plotter subroutines and arrays.

20667 **(ANL/NESC—852) HEXEREI2; HTGR thermal-hydraulic analysis.** Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Becker, B.R. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048852.

The major restrictions on the general application of the code are that only cylindrical geometry is allowed, and the coolant is assumed to be helium or a helium-air mixture. Problem size maxima include - 50 boundary conditions 100 fine lattice lines along any axis 50 gross lattice lines along any axis 20 heat generation functions 25 initial temperature functions 50 materials 100 regions 20 nodes in special temperature table 121 nodal columns 25 nodal planes when using coolant calculations 25 analytical functions 25 tabular functions 25 points per tabular function 100 printout times.

HEXEREI2 is a complex program capable of analyzing High Temperature Gas-Cooled Reactors (HTGRs) during accidents to provide most of the information needed for HTGR safety studies. HEXEREI2 is designed to solve steady-state and transient three-dimensional heat conduction, coupled with convection to axially flowing coolant in a large number of parallel channels. Both the coolant temperature and flow distribution among the channels are influenced by the heat transferred into the coolant. The thermal conductivity, density, and specific heat may be spatial- and temperature-dependent and may be modified further by HTGR design parameters. The conductivity can be anisotropic. Heat generation rates may be dependent on time, position, and HTGR design parameters. The boundary temperatures may be time-dependent. The boundary conditions may be fixed temperatures or any combination of prescribed heat flux, forced convection, and radiation from a surface to a boundary temperature. The boundary condition parameters may be time- and temperature-dependent. HEXEREI2 can model a coolant which may be helium, air, or a helium-air mixture. The nodal mesh is automatically generated from input parameters and produces a model capable of an accurate thermal-hydraulic analysis of an HTGR. The generated mesh emulates the HTGR in geometric structure allowing the code to analyze the largest HTGR design yet proposed.IBM360; FORTRAN IV (99%) and BAL (1%); OS/360; The maximum number of nodes can be easily adjusted to fit the problem and computer storage limitations. The storage requirement on an IBM360 machine ranges from 314K bytes for one node to 1500K bytes for 6000 nodes. The sample problems required 490K bytes on an IBM370/195.

20668 (ANL/NESC—871R) ICARUS; redundant system unavailability model. Vaurio, J.K. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048871.

The system configuration is limited to m/n with 1.LE.m.LE.n.LE.4. The three testing strategies allowed are random, uniformly staggered, and nearly simultaneous. In the random scheme, the components are tested at randomly shifted times throughout the test interval. The uniformly staggered scheme performs the component tests at equally-spaced times throughout the test interval. In the nearly simultaneous schemes, all components are tested consecutively at the beginning of the interval. The equations assume only one component per redundancy. However, redundancies with several components in series can be analyzed by properly defining the failure data for a series system in terms of the data for individual components. .

ICARUS calculates the unavailability characteristics of a periodically tested standby system with m-out-of-n redundancy (1.LE.m.LE.n.LE.4). The main functions of the program are to calculate the average unavailability, the optimum test interval, and fractional unavailabilities due to testing, repair, and random failures for three different testing strategies. The program will also calculate the average unavailability as a function of the test interval at each point in the range 0.2T(optimum) to 1.8T(optimum) at intervals of 0.2T(optimum). ICARUS can be used to evaluate sensitivities to different failure modes and data, as well as current testing or repair strategies, to determine if changes to these strategies will optimize the system availability.IBM370,303x; FORTRAN IV; OS/370; 60K bytes of memory are required for execution of the program.

20669 (ANL/NESC—889) RAS; reliability analysis for phased missions. Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Burdick, G.R. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048889.

Maximum of - 5 distinct phases per mission.

The Reliability Analysis System, RAS, is an integrated package of computer programs for the quantification of fault trees. In particular, RAS has the capability of performing phased mission analysis. A phased mission is a task to be performed by a system during which the logic model and/or the component failure mode characteristics change at predetermined times. RAS is capable of finding minimal cut sets from fault trees and of calculating reliability characteristics for the basic events, the minimal cut sets, and the top event of a fault tree. In addition, mission cut set cancellation and four methods of bounding mission unreliability have been incorporated into RAS.CDC CYBER176;CDC7600,6600; FORTRAN IV (96%) and COMPASS (4%); SCOPE 2.1 (CDC7600), NOS/BE (CDC CYBER176, CDC6600); If the program is segmented, 42,000 (octal) words of small core memory (SCM) and 10 (octal) words of large core memory (LCM) are required for execution on a CDC7600. For the CDC6600, 135,000 (octal) words of central memory and 10 (octal) words of Extended Core Storage (ECS) are required. Without segmentation, additional memory will be required.

20670 (ANL/NESC—890) SAFE; fail-to-safe analysis of protective networks. Kontoleon, J.M. (Wollongong Univ. (Australia). Dept. of Electrical Engineering). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048890.

Maxima of - 100 buffer nodes 100 input nodes 50 logic nodes The program makes the following assumptions: a) All nodes are s-independent. b) Logic nodes are perfectly reliable. c) Input nodes, buffer nodes, and the protective network itself can be in either a good, fail-to-safe, or fail-to-danger state. d) A failed input or buffer node cannot become good or change mode of failure.

SAFE is designed to analyze the fail-to-safe (FS) and fail-to-danger (FD) probabilities of failure of large protective networks, such as those associated with nuclear reactor protective systems. Components of the protective network may include sensors, safety lines, and logic units which have either an m-out-of-n or a majority voting configuration. Sensors and safety lines may fail in either a FS or FD mode of failure. The overall logic protective network is modeled as a network with three types of nodes - input, buffer, and logic - and arcs. The nodes specify the components involved in the logic network and the arcs their interconnections. The nodes are numbered successively to provide a simple description of the logic protective network to the computer. The simulation of unreliable logic nodes is done by the use of reliable logic nodes and unreliable buffer nodes. The program can also be used in the evaluation of the probability of occurrence of the top event in a fault tree, provided the bottom events are s-independent and not mutually exclusive.UNIVAC1106,1100; FORTRAN IV, ASCII FORTRAN (FTN) compiler; EXEC8 Level 36; 44,000 words of memory are required for execution.

20671 (ANL/NESC—901) PAD; one-dimensional coupled Sn neutronics & hydrodynamics. Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; McLaughlin, T.P. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048901.

Maxima of - 100 hydrodynamic regions 40 materials 16 neutron energy groups.

The PAjarito Dynamics (PAD) program models dynamic systems with interactive neutronics, thermodynamics, and hydrodynamics in one-dimensional spherical, cylindrical, and planar geometries. The program has been applied to prompt critical excursions in various fissioning systems (solution, metal, LMFBR, etc.) as well as to nonfissioning systems. PAD applications have included: controlled (nondestructive) and damaging reactor transient experiments, hypothetical LMFBR disassembly and recriticality accidents, hypothetical criticality accidents involving the handling and processing of various forms of fissile materials, and nonneutronic systems employing only the thermodynamic and hydrodynamic aspects of the program.CDC7600,6600,6400; FORTRAN IV (RUN compiler); SCOPE 2.1.5 (CDC7600); PAD requires system input and output units and a bulk storage device (e.g., disk or tape) on which four coded files may be defined. Each file should have a 32,000 (octal), 60-bit word capacity. PAD requires approximately 140K (octal) words of storage for execution on a CDC7600.

20672 (ANL/NESC—906R) DSTRESS; transient fuel model for clad strain. Fox, G.L. (Hanford Engineering Development Lab., Richland, WA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048906.

Maxima of - 99 temperature-time points 22 fuel mesh points 1 cladding mesh point 7 pairs of print intervals The fuel temperature history must be supplied as input data. Cracked fuel is assumed to have an infinite number of cracks in a particular direction so the stress normal to the crack is equal to the negative of the crack gas pressure. Cracks in the circumferential direction are not allowed.

DSTRESS calculates cladding strains produced by the fuel when a fuel pin is subjected to an overpower transient. The mechanistic fuel model calculates fuel stresses with high creep rates, melting, cracking, and the accommodation of thermal expansion by the crack volume.CDC6600,CYBER175; FORTRAN IV; SCOPE 3.4 (CDC6600), NOS 1.3 (CDC CYBER175); DSTRESS requires 43,000 (octal) words of memory for execution. The plotting program, PLOTR, requires 61,000 (octal) words of memory. DSTRESS creates a data file used as input to PLOTR on logical unit 8.

20673 (ANL/NESC—917) RELAP5/MOD1/018; LWR loss of coolant analysis. Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; James, S.W. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048917.

The limitations on the number of hydrodynamic volumes, heat structures, trips, minor edits, etc. are primarily dictated by the available memory of the computer. Dynamic allocation of storage is used for all problem-dependent data. Design of the fields used for input data can also impose limits. Problems with over 150 hydrodynamic volumes and over 100 heat structures have been run on a CYBER176 using 270K of SCM and 200K of LCM storage for input processing and less during transient analysis.

RELAP5 was developed to describe the behavior of a light water reactor (LWR) subjected to postulated transients such as loss of coolant from large or small pipe breaks, pump failures, etc. RELAP5 calculates fluid conditions such as velocities, pressures, densities, qualities, temperatures; thermal conditions such as surface temperatures, temperature distributions, heat fluxes; pump conditions; trip conditions; reactor power and reactivity from point reactor kinetics; and control system variables. In addition to reactor applications, the program can be applied to transient analysis of other thermal-hydraulic systems with water as the fluid. RELAP5 uses a five equation two-phase flow hydrodynamic model consisting of the two phasic continuity equations, the two phasic momentum equations, and an overall energy equation augmented by the requirement that one of the phases is assumed saturated. In this model only two interphase constitutive relations are required, those for interphase drag and interphase mass exchange. Models are included for abrupt area changes, choking, mass transfer, interphase drag, wall friction, and branching.CDC CYBER176;CDC7600; FORTRAN IV (90%) and COMPASS (10%); NOS/BE (CDC CYBER176), SCOPE 2.1.5 (CDC7600); RELAP5 has run on a 64K CDC7600 and a 132K CYBER176 both with and without use of LCM storage. The RELAP5 package contains options (implemented through the CDC UPDATE utility program) intended to allow RELAP5 implementation on a CYBER76 operating under SCOPE2 and a CYBER170 or similar CYBER series hardware under NOS/BE.

20674 (ANL/NESC—927) SPIRT; stress-strains from transient pressures. Siefken, L.J. (EG and G Idaho, Inc., Idaho Falls (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048927.

The SPIRT (Stress-strains from Pressures Instigated by Reactor Transients) program was developed to predict the pressure generated by the rapid dispersal of molten UO2 from power-reactor-type fuel rods into the coolant water. This rapid dispersal of molten fuel results from very high-power excursions initiated by the rapid insertion of reactivity. SPIRT was used in the safety analyses of the ATR and ETR. The program can analyze the response of one-dimensional plane, cylindrical, and spherical geometric configurations to pressure-generating heat sources with free- or fixed-surface boundary conditions. SPIRT can calculate the response of systems to the dispersal of hot fuel particles as a function of the following variables: enthalpy of fuel at time of dispersal, rate at which fuel is dispersed, size of dispersed fuel droplets, dispersal density of fuel (grams of fuel dispersed per cc of water), quality of water at time of fuel dispersal, enthalpy of water at time of fuel dispersal, system pressure at time of fuel dispersal, and the size and constituency of the medium enveloping the dispersed fuel. By holding all but one of the listed variables constant, and varying that one, the program computes the relative effect of that variable upon the response of systems to the dispersal of hot fuel. SPIRT exists as two releases - one, written for UO2 fuel is called SPIRTU; the second, for uranium-aluminide fuel is identified as SPIRTA.CDC CYBER76,175; FORTRAN IV; SCOPE 2.1 (CDC CYBER76), NOS 1.3 (CDC CYBER175); SPIRTU and SPIRTA require approximately 173K (octal) words for execution under NOS 1.3.

20675 (ANL/NESC—943) RIO; power plant reliability characteristics. Poloski, J.P. (EG and G Idaho, Inc., Idaho Falls (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048943.

Maxima of - 150 accident sequences per release category (PHASE1) 25 events per accident sequence (PHASE1) 25 sets of data for describing the safety systems, initiators, and containment failure modes (PHASE1) 40 constraint equations (PHASE2),20 independent variables (PHASE2).

RIO, which consists of two FORTRAN programs, determines reliability importance and allocates optimal reliability goals for nuclear power plant safety systems. The first program, PHASE1, determines the importance of each safety system's contribution to overall plant risk and ranks the systems accordingly. The second program, PHASE2, is a nonlinear optimization code that determines optimal values of systems' reliability characteristics subject to the risk constraints imposed on the plant.CDC7600,CYBER175; FORTRAN IV (86%) and COMPASS (14%); SCOPE 2.1 (CDC7600), NOS 1.3 (CDC CYBER175); 30,000 (octal) words of memory are required by the PHASE1 program; PHASE2 requires 40,000 (octal) words.

20676 (CONF-800804—44) LMFBR operational and experimental in-core local-fault experience, primarily with oxide fuel elements. Warinner, D.K. (Argonne National Lab., IL (USA)). [nd]. Contract W-31-109-ENG-38. 37p. NTIS, PC A03/MF A01. Order Number DE83007817.

From ASME century 2 emerging technology conference; San Francisco, CA, USA (10 Aug 1980).

Case-by-case reviews of selective world experience with severe local faults, particularly fuel failure and fuel degradation, are reviewed for two sodium-cooled thermal reactors, several LMFBRs, and LMFBR-fuels experiments. The review summarizes fuel-failure frequency and illustrates the results of the most damaging LMFBR local-fault experiences of the last 20 years beginning with BR-5 and including DFR, BOR-60, BR2's MFBS-and Mol-loops experiments, Fermi, KNK, Rapsodie, EBR-II, and TREAT-D2. Local-fault accommodation is demonstrated and a need to more thoroughly investigate delayed-neutron and gaseous-fission-product signals is highlighted in view of uranate formation, observed blockages, and slow fuel-element failure-propagation.

20677 (CONF-811003—6) Time-resolved and time-integrated radiography of fast reactor fuel elements. De Volpi, A. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 18p. NTIS, PC A02/MF A01. Order Number DE83007755.

From ASNT fall conference; Atlanta, GA, USA (12 Oct 1981).

The fast-reactor safety program has some unusual requirements in radiography. Applications may be divided into two areas: time-resolved or time-integrated radiography. The fast-neutron hodoscope has supplied all recent time-resolved cineradiographic in-pile fuel-motion data, and various x-ray and photographic techniques have been used for out-of-pile experiments. Thick containers and the large number of radioactive fuel pins involved in safety research have been responsible for some nonconventional applications of time-integrated radiography of stationary objects. Hodoscopes record fuel-motion during transient experiments at the TREAT reactor in the United States and CABRI in France. Other special techniques have been under development for out-of-pile nondestructive radiography of fuel element subassemblies, including fast-neutron and gamma-ray tomographic methods.

20678 (CONF-820406—24) **Technical feasibility of transition phase tests in TREAT.** Stewart, R.R.; Bauer, T.H.; Hoff, O.I.; Koyama, K.; Stephenson, M.E.; Kraft, T.E. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 9p. NTIS, PC A02/MF A01. Order Number DE83007732.

From Topical meeting on fast, thermal and fusion reactor experiments; Salt Lake City, UT, USA (12 Apr 1982).

Understanding the behavior of molten fuel-steel mixtures subjected to fission heating within a HCDA environment is essential to continuing the mechanistic description of the whole-core accident into the transition phase, and further to a permanent subcritical and safe fuel debris configuration. Fundamentally, the RX1 TREAT test will simulte the transition phase of a HCDA (the accident phase in which the fuel in individual subassemblies melts and becomes a heat-generating pool of molten fuel and boiling steel). This assessment of the feasibility of such a test indicates that a transition phase test can be achieved in TREAT, at power levels simulating decay heat.

20679 (CONF-820566—8) **Design analysis of the upgraded TREAT reactor.** Bhattacharyya, S.K. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 24p. NTIS, PC A02/MF A01. Order Number DE83007680.

From Thermal reactor benchmark calculations, techniques, results and applications seminar; Upton, NY, USA (17 May 1982).

The TREAT reactor, fueled by a dilute dispersion of fully enriched UO_2 in graphite, has been a premier transient testing facility since 1959. A major Upgrade of the reactor is in progress to enhance its transient testing capability in support of the LMFBR safety program. The TREAT Upgrade (TU) reactor features a modified central zone of the core with higher fissile loadings of the same fuel, clad in Inconel to allow operation at higher temperatures. The demanding functional requirements on the reactor necessitated the use of unique features in the core design which, in turn, presented major calculational complexities in the analysis. Special design methods had to be used in many cases to treat these complexities. The addition of an improved Reactor Control System, a safety grade Plant Protection System and an enhanced Coolant/Filtration System produces a reactor that can meet the functional requirements on the reactor in a safe manner.

20680 (CONF-820601—24) **Hydrodynamics of annular-dispersed flow.** Ishii, M.; Kataoka, I. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 36p. NTIS, PC A03/MF A01. Order Number DE83007625.

From ASME pressure vessel and piping conference; Orlando, FL, USA (27 Jun 1982).

The interfacial drag, droplet entrainment, and droplet size distributions are important for detailed mechanistic modeling of annular dispersed two-phase flow. In view of this, recently developed correlations for these parameters are presented and discussed in this paper. The drag correlations for multiple fluid particle systems have been developed from a similarity hypothesis based on the mixture viscosity model. The results show that the drag coefficient depends on the particle Reynolds number and droplet concentration. The onset on droplet entrainment significantly alters the mechanisms of mass, momentum, and energy transfer between the film and gas core flow as well as the transfer between the two-phase mixture and the wall. By assuming the roll wave entrainment mechanism, the correlations for the amount of entrained droplet as well as for the droplet size distribution have been obtained from a simple model in collaboration with a large number of data.

20681 (CONF-820802—53) **Volatile fission-product source term evaluation using the fastgrass comptuer code.** Rest, J. (Argonne National Lab., IL (USA)). Aug 1982. Contract W-31-109-ENG-38. 16p. NTIS, PC A02/MF A01. Order Number DE83007714.

From International meeting on thermal nuclear reactor safety; Chicago, IL, USA (29 Aug 1982).

As the noble gases play a major role in establishing the interconnection of escape routes from the interior to the exterior of nuclear reactor fuel, a realistic description of the release of volatile fission products (VFPs) must a priori include a realistic description of fission-gas release and swelling. The steady-state and transient gas release and swelling subroutine, FASTGRASS, has been modified to include a mechanistic description of behavior of VFPs (I, Cs, CsI, Cs_2MoO_4, and Cs_2UO_4). Phenomena modeled are the chemical reactions between the VFPs, VFP migration through the fuel, and VFP interaction with the noble gases. This paper will describe calculations performed with FASTGRASS to describe the release of noble gases, I, Cs, and CsI from LWR fuel during steady-state and power-ramping conditions. Key issues that are addressed in the analysis are the effects of (a) VFP chemistry, (b) various assumptions concerning mechanisms of VFP migration through solid UO_2, (c) fission-gas behavior, and (d) accident scenario on the chemical form of iodine and the rate of iodine release from water-reactor fuel.

20682 (CONF-820810—15) **Calculational limitations in PWR system simulation.** Abramson, P.B.; Kennedy, M.F.; Speis, T.P. (Argonne National Lab., IL (USA); Nuclear Regulatory Commission, Washington, DC (USA)). 1982. Contract W-31-109-ENG-38. 4p. NTIS, PC A02/MF A01. Order Number DE83007633.

From 10. international mathematics and computers simulation congress on systems simulation and scientific computation; Montreal, Canada (9 Aug 1982).

Engineering transient analysis codes, which are in general more accurate than the present generation of simulator software, can be expected to yield reasonably accurate results (+-20% or so on system pressure) if carefully utilized and if the two-phase and transient flow conditions are not severe. As the severity of the transient increases, the confidence that one may have in the results decreases. None of the existing engineering analysis codes is well assessed or verified for transient analysis, but all give qualitatively the same results lending credence to their results. Recent comparisons to transients in LOFT and SEMISCALE are encouraging as are various comparisons to actual plant data.

20683 (CONF-820901—7) **Liquid transfer and entrainment correlation for droplet-annular flow.** Ishii, M.; Mishima, K. (Argonne National Lab., IL (USA); Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst.). 1982. Contract W-31-109-ENG-38. 7p. NTIS, PC A02/MF A01. Order Number DE83007703.

From 7. international heat transfer conference; Munich, F.R. Germany (6 Sep 1982).

A correlation for the amount of entrained liquid in annular flow has been developed from a simple model and experimental data. There are basically two different regions of entrainment, namely, the entrance and quasi-equilibrium regions. The correlation for the equilibrium region is expressed in terms of the dimensionless gas flux, diameter, cand total liquid Reynolds number. The entrance effect is taken into account by an exponential relaxation function. It has been shown that this new model can satisfactorily correlate wide ranges of experimental data for water. Furthermore, the necessary distance for the development of entrainment is identified. These correlations, therefore, can supply accurate information on entrainment which has not been available previously.

20684 (CONF-820901—8) **Experimental study on natural-convection boiling burnout in an annulus.** Mishima, K.; Ishii, M. (Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst.; Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 7p. NTIS, PC A02/MF A01. Order Number DE83007705.

From 7. international heat transfer conference; Munich, F.R. Germany (6 Sep 1982).

An experimental study was performed on burnout heat flux at low flow rates for low-pressure steam-water upward flow in an annulus. The data indicated that a premature burnout occurred due to flow-regime transition from churn-turbulent to annular flow. It is shown that the burnout observed in the experiment is essentially a flooding-limited burnout and the burnout heat flux can be well reproduced by a nondimensional correlation derived from the previously obtained criterion for flow-regime transition. It is also shown that the conventional correlations for burnout heat flux at low mass velocities agree well with the data on circulation and entrainment-limited burnout.

20685 (CONF-820985—3) Vapor pressures and vapor compositions in equilibrium with hypostoichiometric uranium-plutonium dioxide at high temperatures. Green, D.W.; Fink, J.K.; Leibowitz, L. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 24p. NTIS, PC A02/MF A01. Order Number DE83007722.

From 8. European conference on thermophysical properties - high temperatures high pressure; Baden-Baden, F.R. Germany (27 Sep 1982).

Vapor pressures and vapor compositions in equilibrium with a hypostoichiometric uranium-plutonium dioxide condensed phase (U/sub 1-y/Pu/sub y/)O/sub 2-x/, as functions of T, x, and y, have been calculated for $0.0 \leqq x \leqq 0.1$, $0.0 \leqq y \leqq 0.3$, and for the temperature range $2500 \leqq T \leqq 6000$ K. The range of compositions and temperatures was limited to the region of interest to reactor safety analysis. Thermodynamic functions for the condensed phase and for each of the gaseous species were combined with an oxygen potential model to obtain partial pressures of O, O_2, Pu, PuO, PuO_2, U, UO, UO_2, and UO_3 as functions of T, x, and y.

20686 (CONF-8106164—4) Thermophysical properties of reactor fuels. Leibowitz, L. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 29p. NTIS, PC A03/MF A01. Order Number DE83007935.

From National Bureau of Standards joint conferences: 8. symposium on thermophysical properties; 17. thermal conductivity conference; 8. thermal expansion conference; Gaithersburg, MD, USA (15 Jun 1981).

A review is presented of the literature on the enthalpy of uranium, thorium, and plutonium oxide and an approach is described for calculating the vapor pressure and gaseous composition of reactor fuel. In these calculations, thermodynamic functions of gas phase molecular species (obtained from matrix-isolation spectroscopy) are employed in conjunction with condensed phase therodynamics. A summary is presented of the status of this work.

20687 (CONF-8109206—1) Transition from forced to natural convective flow in an LMFBR under adverse thermal conditions. Singer, R.M.; Mohr, D.; Gillette, J.L. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 8p. NTIS, PC A02/MF A01. Order Number DE83007706.

From 7. international heat transfer conference; Munich, F.R. Germany (6 Sep 1981).

One of the most important aspects of the demonstration of the safety of liquid metal cooled fast reactors (LMFBR) is the assurance of adequate cooling of the reactor and critical structures during all potential or hypothetical events. To this end, a design philosophy has developed in which alternate heat removal systems are included in a plant in order to provide independent, diverse, and redundant cooling from the normal heat transport system. Recent studies have examined various aspects of natural convective flow in such systems and preliminary conclusions from these efforts have indicated that the basic phenomena are reasonably well understood and predictable in most cases. However, in certain situations where significant thermal stratification occurs, the resulting buoyancy-driven flow patterns can become quite complex and as a result, the confidence in computer simulations diminishes. The purpose of this paper is to present the results of an experimental and analytical study of one class of such problems in which the development of natural convective flow requires a transition through an unstably stratified condition. The experiments were conducted in the Experimental Breeder Reactor II (EBR-II) and the analytical tool used was the NATDEMO system simulation code.

20688 (DOE/SF/02034—T82) Application of the lines-of-protection concept to the HTGR-SC/C. (Gas-Cooled Reactor Associates, La Jolla, CA (USA)). Sep 1981. Contract AC03-78SF02034. 90p. NTIS, PC A05/MF A01. Order Number DE83008099.

The purpose of this document is to present a method for structuring the safety related design and development plans for the HTGR. This method centers on and develops the concept that the HTGR inherently (and by design) provides independent and successive LOPs against potential core related accidents and any resulting public harm. To exemplify the LOP concept and its application to the HTGR, this document identifies some key bases and assumptions, describes the four LOPs selected for the HTGR, identifies the associated safety goals and plant success criteria, and establishes methods for safety research and development prioritization. A task breakdown structure is then described, which in a complete hierarchial fashion can be used to catalog all safety related tasks necessary to demonstrate LOP success as well as catalog safety research areas which cannot be conveniently grouped under the LOPs.

20689 (EPRI-NP—1850-CCM-Vol.4) RETRAN-02: a program for transient thermal-hydraulic analysis of complex fluid-flow systems. Volume 4. Applications. Peterson, C.E.; Gose, G.C.; McFadden, J.H. (Energy, Inc., Idaho Falls, ID (USA)). Jan 1983. 400p. NTIS, PC A17/MF A01. Order Number DE83901473.

RETRAN-02 represents a significant achievement in the development of a versatile and reliable computer program for use in best estimate transient thermal-hydraulic analysis of light water reactor systems. The RETRAN-02 computer program is an extension of the RETRAN-01 program designed to provide analysis capabilities for 1) BWR and PWR transients, 2) small break loss of coolant accidents, 3) balance of plant modeling, and 4) anticipated transients without scram, while maintaining the analysis capabilities of the predecessor code. The RETRAN-02 computer code is constructed in a semimodular and dynamic dimensioned form where additions to the code can be easily carried out as new and improved models are developed. This report (the fourth of a five volume computer code manual) describes the verification and validation of RETRAN-02.

20690 (EPRI-NP—2279) Westinghouse FREY calculations: excessive load increase, boron dilution, and rod withdrawal at power. Final report. Bein, J.D.; Ciccone, L.; Leech, W.J. (Westinghouse Electric Corp., Monroeville, PA (USA)). Feb 1982. 82p. NTIS (US Sales Only). Order Number DE82903310.

The purpose of this investigation was to execute three sample problems with the FREY Code (a transient analysis code for fuel rods), to document the problems, and to discuss the results. Three ANSI Condition II overpower transients were evaluated. Problem inputs were generated from reactor system models and fuel rod parameters. FREY results were compared to results from a Westinghouse fuel rod modeling code. FREY results for fuel temperatures in general display the correct trend with time during the transients. FREY temperature results are lower than the values obtained from the Westinghouse code. These differences were found to have been principally due to differences in the calculated gap conductance values.

20691 (EPRI-NP—2742) Scale-model turbine-missile-casing impact tests. Final report. Romander, C.M.; Florence, A.L. (SRI International, Menlo Park, CA (USA)). Jan 1983. 103p. NTIS, PC A06/MF A01. Order Number DE83901487.

Three 1/5-scale model turbine missile impact experiments are described in this report. These experiments were performed by SRI in support of the EPRI program to provide bench mark data for assessing turbine missile effects in nuclear plant design. The objective of the SRI experiments was to demonstrate the applicability of scaling in turbine missile impact of steel casing structures by comparing the results of the 1/5-scale tests with comparable full-scale tests performed by Sandia Laboratories. In the scale model experiments, geometric scaling was used where dimensions are reduced by the scale factor while materials, stresses, strains, and velocities remain the same as in the prototype. An explosive launcher was developed to accelerate the 1/5-scale models of a turbine missile to the desired impact velocities. The results of the scale model experiments agreed well with the results of the full-scale experiments and were sufficient to demonstrate scalability.

20692 (EUR—7053-EN) A theoretical study on the growth of large sodium vapour bubbles in liquid sodium. (Commission of the European Communities, Luxembourg). [nd]. 83p. NTIS, PC AE04/MF E04.

The growth of a large sodium vapour HCDA bubble in a finite pool of cold sodium is studied. During the growth the bubble is fed with hot vapor coming from the core. Temperature differences at the phase interface are then taken into account and the effect of non-condensable fission gases is parametrically investigated. Results are presented in graphical form for the case of a typical 300 MW fast breeder reactor. An increase in the quantity of non-condensable fission gases is shown to cause a slight increase in the growth velocity, a much greater increase of the vapor temperature and a decrease of the temperature of the liquid sodium at the bubble surface.

20693 (GKSS—82/E/23) **Vibration phenomena in large scale pressure suppression tests.** Aust, E.; Boettcher, G.; Kolb, M.; Sattler, P.; Vollbrandt, J. (GKSS-Forschungszentrum Geesthacht G.m.b.H., Geesthacht-Tesperhude (Germany, F.R.)). 1982. 19p. (CONF-8205131—2). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83750183.

From 3. international conference on vibrations in nuclear plants; Keswick, UK (11 May 1982).

Structure und fluid vibration phenomena (acceleration, strain; pressure, level) were observed during blow-down experiments simulating a LOCA in the GKSS full scale multivent pressure suppression test facility. The paper describes first the source related excitations during the two regimes of condensation oscillation and of chugging, and deals then with the response vibrations of the facility's wetwell. Modal analyses of the wetwell were run using excitation by hammer and by shaker in order to separate phenomena that are particular to the GKSS facility from more general ones, i.e. phenomena specific to the fluid related parameters of blowdown and to the geometry of the vent pipes only. The lowest periodicities at about 12 and 16 Hz stem from the vent acoustics. A frequency of about 36 to 38 Hz prominent during chugging seems to result from the lowest local models of two of the wetwell's walls when coupled by the wetwell pool. Further peaks found during blowdown in the spectra of signals at higher frequencies correspond to global vibration modes of the wetwell.

20694 (Juel-Conf—43, pp 43-52) **Graphite corrosion in the HTR-type pebble bed reactor during accidents with air leakage and effects of air leakage combined with water ingress.** Katscher, W.; Moormann, R. Nov 1981. (In German). NTIS (US Sales Only), PC A07/MF A01.

From Seminar of the KTG on chemistry and nuclear waste disposal; Juelich, F.R. Germany (5 Nov 1981).

In addition to the calculations concerning accidents occurring in the HTR-type reactor relieved from pressure it is possible to study also accidents occurring under pressure by means of the calculation model REACT/THERMIX. Calculations which refer to the accident caused by water ingress have already been made for the PNP-300. The HTR-type reactor behaves well under massive air and/or water ingress when during after-heat removal.

20695 (KFK—3275, pp 39-43) **Precaution against damage required in the light of existing scientific and technical knowledge.** Smidt, D. Nov 1981. (In German). Dep. NTIS (US Sales Only).

Course of lectures of Karlsruhe Nuclear Research Centre and the University of Administrative Science, Speyer on May 18, 1981, June 1, 1981, June 22, 1981.

In Technical risks and law.

The author shows that in the past few years a growing complement to deterministic approach has developed due to probabilistic analysis. By means of this, a concept rendered perfect on singular points can be replaced by a well-balanced safety concept. That is why the major advantage brought about by these methods does not lie in the determination of absolute risk qualities, but in the improved transparency of the safety concept and in the spotting of weak points. Anyone determining existing knowledge in science and technology will have to use this tool. However, it has to be backed up by solid technical expertise and experience. Moreover, existing knowledge in science and technology is based on experts' consensus on experimental verification, tests, and on well-balancedness. Based on this approach, considerable improvements have been achieved in the material field during the past few years, which - in my opinion - have made the nuclear risk an acceptable one.

20696 (KFK—3275, pp 45-52) **Legal opinion in risk assessment of nuclear power plants.** Ossenbuehl, F. Nov 1981. (In German). Dep. NTIS (US Sales Only).

Course of lectures of Karlsruhe Nuclear Research Centre and the University of Administrative Science, Speyer on May 18, 1981, June 1, 1981, June 22, 1981.

In Technical risks and law.

The author describes the conceptual panoply and the starting position in law. Then he defines and determines residual risk. Using protection against bursting as an example, he demonstrates the problem of decision-making, discussing the decisions of Freiburg Administrative Court in the matter of the Whyl reactor, and the decision of Wuerzburg Administrative Court in the matter of the Grafenrheinfeld reactor. By 'establishing rules high above' the problem of decision-making can only be solved in parts. It is hardly possible to circumscribe exactly the control density of judicial reviewing in law. This density largely falls to the jurisdiction of the courts responsible, according to the density of the regulation. It appears questionable whether the time has come is ripe for transfering the 'establishment of rules on the outside', i.e. by informal technical bodies and committees, into the 'establishment of rules high above'. As long as we find ourselves in a relatively rapidly developing technological environment and at an experimental stage, even statutory orders may well be too rigid to be normative instruments.

20697 (LA—9619-MS) **Mechanistic debris-bed packing model.** Moore, J.A. (Los Alamos National Lab., NM (USA)). Feb 1983. Contract W-7405-ENG-36. 21p. NTIS, PC A02/MF A01. Order Number DE83008271.

The nonrandom packing of fuel rod debris around and above the surviving fuel rod segments is analyzed for a degraded core with the spacer grids modeled as a porous floor. The irregular shape of the debris is simulated by assuming that all of the spherical particles terminate their migration within the debris bed at their first two-point contact. Comparing computational results with experimental data for nonrandom packing verified the analytical approach. Specific calculations for the TMI-2 geometry reveal an average (horizontally integrated) nonrandom packing density between the fuel rods of ~ 0.30. If simulated vibrations are imposed, this value increases to 0.50. If the debris bed builds up above the fuel rod stubs, the average (horizontally integrated) packing density above these rods is ~ 0.38 without vibrations; loosely packed gravel has an average packing density of 0.45.

20698 (NP—3900667) **Effect of pulsation pipelines in nuclear installations on the environment.** Case, P.; Dagbjartsson, S.; Heger, L.; Ionescu, A.; Mieze, G. (Fichtner Beratende Ingenieure G.m.b.H. and Co. KG, Stuttgart (Germany, F.R.)). Jul 1981. 308p. (In German). Dep. NTIS (US Sales Only), MF A01. Order Number DE83900667.

A model study is made of the effect that burst pipes have on the pulsation of conduits through the use of computerized programs. The model study results are compared to installations with corresponding technology. Computer capabilities are presented as well as results of dynamic elastic linear computations and derived formulations.

20699 (NUREG—0090-V4-N4) **Report to Congress on abnormal occurrences, October-December 1981. Quarterly report.** (Nuclear Regulatory Commission, Washington, DC (USA)). May 1982. 36p. NTIS, PC A03/MF A01.

During the report period, there were two abnormal occurrences at the nuclear power plants licensed to operate. One involved a generic concern pertaining to blockage of coolant flow to safety-related systems. The other involved seismic design errors at Diablo Canyon Nuclear Power Plant with subsequent suspension of the fuel load and low power operating license for Unit 1. There were no abnormal occurrences for the other NRC licensees during the report period; the Agreement States reported no abnormal occurrences to the NRC. The report also contains information updating a previously reported abnormal occurrence.

20700 (NUREG—0485-V4-N4) **Systematic evaluation program status summary report, April 1982.** (Nuclear Regulatory Commission, Washington, DC (USA)). May 1982. 98p. NTIS, PC A05/MF A01.

The Systematic Evaluation Program examines many safety-related aspects of eleven of the older light water reactors. This document provides the existing status of the review process including individual topic and overall completion status.

20701 (NUREG—0606-Vol.5-No.1) **Unresolved safety-issues summary. Aqua book.** (Nuclear Regulatory Commission, Washington, DC (USA). Office of Resource Management). 18 Feb 1983. 92p. NTIS, PC A05/MF A01 - GPO. Order Number DE83901547.

The unresolved safety issues summary is designed to provide the management of the Nuclear Regulatory Commission with a quarterly overview of the progress and plans for completion of generic tasks addressing unresolved safety issues reported to Congress pursuant to Section 210 of the Energy Reorganization Act of 1974 as amended. This summary utilizes data collected from the Office of Nuclear Reactor Regulation, Office of Nuclear Regulatory Research, and the National Laboratories and is prepared by the Office of Resource Management. The schedules in this book include a milestone at the end of each action plan which represents the initiation of the implementation process both with respect to incorporation of the technical resolution of the NRC official guidance or requirements and also the application of changes to individual operating plants.

20702 (NUREG—0825) **Integrated Plant Safety Assessment, Systematic Evaluation Program. Yankee Nuclear Power Station, Yankee Atomic Electric Company, Docket No. 50-29. Draft report.** (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Reactor Regulation). Feb 1983. 549p. NTIS, PC A23/MF A01 - GPO $12.00. Order Number DE83901543.

The Systematic Evaluation Program was initiated in February 1977 by the US Nuclear Regulatory Commission to review the designs of older operating nuclear reactor plants to confirm and document their safety. The review provides (1) an assessment of how these plants compare with current licensing safety requirements relating to selected issues, (2) a basis for deciding on how these differences should be resolved in an integrated plant review, and (3) a documented evaluation of plant safety. This report documents the review of Yankee Nuclear Power Station, operated by Yankee Atomic Electric Company. The Yankee plant is one of 10 plants reviewed under Phase II of this program. This report indicates how 137 topics selected for review under Phase I of the program were addressed. Equipment and procedural changes have been identified as a result of the review.

20703 (NUREG—0845) **Agency procedures for the NRC incident response plan. Final report.** (Nuclear Regulatory Commission, Washington, DC (USA). Office of Inspection and Enforcement). Feb 1983. 294p. NTIS- GPO $8.50. Order Number DE83901540.

The NRC Incident Response Plan, NUREG-0728/MC 0502 describes the functions of the NRC during an incident and the kinds of actions that comprise an NRC response. The NRC response plan will be activated in accordance with threshold criteria described in the plan for incidents occurring at nuclear reactors and fuel facilities involving materials licensees; during transportation of licensed material, and for threats against facilities or licensed material. In contrast to the general overview provided by the Plan, the purpose of these agency procedures is to delineate the manner in which each planned response function is performed; the criteria for making those response decisions which can be preplanned; and the information and other resources needed during a response. An inexperienced but qualified person should be able to perform functions assigned by the Plan and make necessary decisions, given the specified information, by becoming familiar with these procedures. This rule of thumb has been used to determine the amount of detail in which the agency procedures are described. These procedures form a foundation for the training of response personnel both in their normal working environment and during planned emergency exercises. These procedures also form a ready reference or reminder checklist for technical team members and managers during a response.

20704 (NUREG—0891) **Nuclear property insurance: status and outlook.** (Nuclear Regulatory Commission, Washington, DC (USA)). May 1982. 134p. NTIS, PC A07/MF A01.

The report addresses the problem of the unavailability of adequate levels of property insurance for commercial power reactors to pay for decontamination and cleanup costs arising from accidents. The report is designed to answer six questions, as follows: (1) What has been the development of each principal source of nuclear property insurance used as of early 1982 by nuclear utilities in the United States; (2) What are some of the distinguishing features of nuclear property insurance as offered by the principal sources; (3) How much nuclear property insurance was offered by each of these sources as of January 1, 1982; (4) Assuming that present plans came to fruition, how much nuclear property insurance is likely to be offered by each of these sources as of January 1, 1983; (5) What, if any, principal sources of nuclear property insurance are likely to emerge in the private sector by January 1, 1983; (6) What problems serious enough to warrant action of the NRC exist with respect to nuclear property insurance and what action should NRC take in response to each problem.

20705 (NUREG—0963) **Review and evaluation of the Nuclear Regulatory Commission Safety Research Program for Fiscal Years 1984 and 1985.** (Nuclear Regulatory Commission, Washington, DC (USA). Advisory Committee on Reactor Safeguards). Feb 1983. 82p. NTIS, PC A05/MF A01 - GPO $5.50. Order Number DE83901519.

Report to the Congress.

This is the sixth report by the Advisory Committee on Reactor Safeguards (ACRS) that has been prepared in response to the Congressional requirement for an annual report on the Nuclear Regulatory Commission (NRC) Reactor Safety Research Program. Part I is a compilation of our general comments and recommendations regarding the NRC Safety Research Program, and includes budget recommendations and an identification of matters of special importance that deserve increased emphasis. It is intended to serve as an Executive Summary. Part II is divided into ten chapters, each of which represents a Decision Unit of the NRC research program. In each chapter, specific comments are included on the research involved in the Decision Unit, an assessment of priorities, and recommendations regarding new directions and levels of funding.

•

20706 (NUREG/CP—0034-Vol.1, pp 108-117) **Neutronic analysis of simulated LMFBR fuel slump experiments.** Henneges, G.; Maschek, W. (Institut fuer Neutronenphysik und Reaktortechnik, Karlsruhe, Germany). Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

Based on LMFBR accident studies at KfK a number of safety-relevant core configurations were defined for the SNEAK 12A critical assembly. They simulate compacted and diluted regions resulting from expulsion of materials from portions of the core. Transport calculational methods were necessary to give a satisfactory interpretation. In the course of these evaluations two different 2-dimensional transport options available at KfK were tested and compared with experimental results. Direct eigen-value results with the S_4P_0 approximation in RZ-geometry predict the reactivity changes fairly well while first order perturbation transport theory leads to deviations which increase with the amount of fuel compacted but stay well below 20 cents if only moderate quantities of fuel are involved.

20707 (NUREG/CP—0034-Vol.1, pp 440-452) **Loss-of-fluid test (LOFT).** Engleman, D.B.; Hanson, D.J.; Knauts, H.E.; Russell, M.L. (EG & G Idaho, Inc., Idaho Falls). Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00. Contract AC07-76ID01570.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

The LOFT Project performs experiments to investigate the thermal-hydraulic and fuel response of a reactor system during simulated off-normal occurrences, including large- and small-break loss-of-coolant accidents (LOCAs), operational transients, and anticipated transients without scram (ATWS). The complex phenomena that are of interest in this diverse experimental program are characterized using a large set of state-of-the-art measurement systems. Included in this set are a group of measurements which are specifically designed to characterize the hydraulic and thermal behavior of the nuclear core. These unique core measurements have evolved through many years of research and development at the Idaho National Engineering Laboratory (INEL). This successful evolution was made possible through use of uncommon materials and original processes for the construction and attachment of the devices. In general, the in-core measurements have provided excellent results while showing good resistance to the harsh environment.

20708 (NUREG/CP—0034-Vol.1, pp 453-467) **Monitoring PWR reactor vessel liquid level with SPNDs during LOCAs.** Adams, J.P. (EG & G Idaho, Inc., Idaho Falls). Aug 1982. NTIS, PC A23/MF A01 - GPO $12.00. Contract AC07-76ID01570.

From NRC meeting on advances in reactor physics and core thermal hydraulics; Kiamesha Lake, NY, USA (22 Sep 1982).

Data from in-core self-powered neutron detectors taken during two nuclear loss-of-coolant accident simulations have been correlated with core moderator density changes. The detector current attenuation has been calculated during blowdown and reflood phases of the simulation. Based on these data, it is concluded that these detectors could be used to monitor reactor vessel liquid level during loss-of-coolant accidents in pressurized water reactors.

20709 (NUREG/CP—0039) **Proceedings of the Health Physics Society 1981 summer school on selected topics in Reactor Health Physics.** Christensen, R.C.; Sayeg, J.A.; Simmons, G.H.; Hahn, O.J. (eds.). (Health Physics Society, East Weymouth, MA (USA)). Dec 1982. 701p. (CONF-8106181—). NTIS, PC A99/MF A01. Order Number DE83900961.

From Health physics summer school on selected topics in reactor health physics; Lexington, KY, USA (14 Jun 1981).

Separate abstracts were prepared for the 21 papers in the proceedings of the Health Physics Society 1981 Summer School on Reactor Health Physics. (KRM)

20710 (NUREG/CP—0039, pp M.1-M.30) **Selected monitoring practices.** Rich, B.L. (EG & G Idaho, Inc., Idaho Falls). Dec 1982. NTIS, PC A99/MF A01. Contract AC07-76ID01570.

From Health physics summer school on selected topics in reactor health physics; Lexington, KY, USA (14 Jun 1981).

This paper covers, in general terms, a discussion of considerations in monitoring and controlling radiation hazards in a nuclear plant. The following areas are discussed: types of fields encountered from fission and activation products, neutron fields, and others, with implications; related considerations such as calibration sources, emergency conditions, ALARA; portable survey instrument considerations as they apply to monitoring; personnel dosimetry, limitations and considerations; field control principles; and effluent evaluation considerations.

20711 (NUREG/CP—0039, pp U.1-U.30) **Impact of the 1980 BEIR-III report on low-level radiation risk assessment, radiation protection guides, and public health policy.** Fabrikant, J.I. (Univ. of California, Berkeley). Dec 1982. NTIS, PC A99/MF A01. Contract W-7405-ENG-48.

From Health physics summer school on selected topics in reactor health physics; Lexington, KY, USA (14 Jun 1981).

This paper presents a general background to our understanding of the potential health effects of low-level radiation. It uses as the basis for discussion the deliberations of the 1980 BEIR Report. Discussion includes: (1) what we know about the important biological and health effects of low-level radiation; (2) what we do not know about these health effects of low-level radiation; (3) what the uncertainties are in the dose-response relationships for radiation-induced cancer; (4) what the controversy is over low-level radiation; and (5) what the uncertainties are in estimation of the carcinogenic risk in man of low-level radiation. Review includes: (1) the sources of epidemiological data for estimation of excess cancer risk in exposed human populations; and (2) the current risk estimates of radiation-induced cancer in man. Discussion also includes what is known about the teratogenic and genetic effects in man of low-level radiation. Conclusions address what the implications are of numerical risk estimation and decision-making for radiological protection and public policy.

20712 (NUREG/CR—1582-Vol.1) **Seismic hazard analysis overview and executive summary.** Bernreuter, D.L.; Minichino, C. (Lawrence Livermore National Lab., CA (USA)). Oct 1982. Contract W-7405-ENG-48. 35p. (UCRL—53030-Vol.1). NTIS, PC A03/MF A01 - GPO. Order Number DE83008594.

The Site Specific Spectra Project (SSSP) described in this report was a multi-year study funded by the US Nuclear Regulatory Commission (NRC) as part of NRC's Systematic Evaluation Program (SEP). The main objective of this project was to provide assistance to the NRC by developing estimates of the seismic hazard at the nine oldest nuclear power plant sites east of the Rocky Mountains which were included in the SEP. This volume gives brief overview of the SEP and the SSSP including a discussion of the formal elicitation of expert opinion used to obtain a subjective representation of parameters that affect seismic hazard and the development of the seismic hazard at the nine SEP facilities.

20713 (NUREG/CR—2334) **Interphase transport in horizontal stratified cocurrent flow.** Jensen, R.J.; Yuen, M.C. (Northwestern Univ., Evanston, IL (USA)). May 1982. 201p. NTIS, PC A10/MF A01.

The problem of interfacial transport in cocurrent, horizontal stratified gas-liquid systems is considered. Local condensation heat transfer coefficients and interface shear stress were obtained from mass and force balances. Based on cocurrent stratified air-water flow data, the noncondensing interface shear stress was found to be a function of the relative velocity between the phases and the liquid fraction. Incorporated into Linehan's relation for condensing flow shear stress, the correlation was found to estimate the shear velocity for the condensation data considered. Local condensation heat transfer coefficients and gas absorption mass transfer coefficients were found to be directly proportional to the shear velocity.

20714 (NUREG/CR—2401) **PWR FLECHT SEASET systems effects: natural circulation and reflux condensation. Task plant report: NRC/EPRI/Westinghouse Report No. 12.** Rosal, E.R.; Hochreiter, L.E.; Andreychek, T.S. (Electric Power Research Inst., Palo Alto, CA (USA); Westinghouse Electric Corp., Pittsburgh, PA (USA)). Feb 1983. 414p. (EPRI-NP—2015; WCAP—9973). NTIS, PC A18/MF A01 - GPO. Order Number DE83901508.

This report presents a descriptive plan of tests for the Systems Effects Task of the Full-Length Emergency Cooling Heat Transfer Systems Effects tests (FLECHT SEASET). This task is designed to produce experimental data which can be used to address issues related to natural circulation cooling modes in a pressurized water reactor (PWR). The natural circulation tests were planned in direct response to the accident at Three Mile Island. The tests consist of natural circulation and reflux condensation cooling experiments using electrical heating rods to simulate curent nuclear core arrays of PWR and PWR fuel vendors. The FLECHT SEASET systems effects tests facility with a scale factor of 1/307 with respect to a four-loop 3411 MWt PWR was used. The facility was designed with all elevations identical to those of a PWR. Two full-height steam generators with active secondary side heat removal are also part of the system design. All tests were conducted with a cosine axial power profile. The data obtained from these tests will be used to evaluate the effets of components and systems parameters during natural circulation cooling modes.

20715 (NUREG/CR—2618) **Experiment data report for Semiscale Mod-2A Natural-Circulation Test S-NC-7C.** Larson, R.A. (EG and G Idaho, Inc., Idaho Falls (USA)). Mar 1982. Contract AC07-76ID01570. 45p. (EGG—2179). NTIS PCE06/MF A01 - GPO. Order Number DE83007981.

This report presents test data recorded for Test S-NC-7C of the Semiscale Mod-2A Natural Circulation Test Series. This is one of several Semiscale tests that investigate the thermal-hydraulic phenomena resulting from operational transients or small-break loss-of-coolant accidents (LOCAs) involving loss of mechanical primary coolant circulation in a pressurized water reactor. These tests produce experimental data to develop and assess the analytical capability of computer models used to predict the results of such small-break LOCAs and operational transients. The primary objectives of Test S-NC-7C were to experimentally characterize the relationship of natural circulation flow to primary system inventory, and to examine the influence on system behavior of imbalancing the secondary side of one loop.

20716 (NUREG/CR—2659) Iodine transport predicted for a postulated steam-line break with concurrent ruptures of steam-generator tubes. Postma, A.K.; Hesson, G.M.; Faletti, D.W. (Pacific Northwest Lab., Richland, WA (USA)). Feb 1983. Contract AC06-76RL01830. 59p. (PNL—3794). NTIS (US Sales Only), PC A04/MF A01 - GPO $5.00. Order Number DE83008319.

Iodine transport in the primary and secondary cooling systems of a pressurized water reactor following a postulated steam line break with concurrent rupture of steam generator tubes was analyzed. The goal of the study was a conservative estimate of the quantity of iodine which could escape from the break to the atmosphere. Ionic iodine, elemental iodine, and methyl iodide were studied. Ionic iodine was the dominant species and its release was governed by the carryover of atomized primary water. The number of ruptured tubes was treated as a parameter. While both an instantaneous and a linear release of iodine from fuel pins to the primary coolant were included in the models, it was found that the instantaneous release dominated because the blowdown transient (IRT Code calculations) lasted just a few minutes. The fraction of an instantaneous iodine source term (total of the three forms) which could escape from the steam line break was predicted to be 3.7% for one ruptured tube and 12.5% for five ruptured tubes. Thus most of the iodine released from the fuel as a result of the postulated accident will be retained within the primary and secondary coolant systems.

20717 (NUREG/CR—2680-Rev.1) Equipment fragility data base. Seismic Safety Margins Research Program. Cover, L.E. (Lawrence Livermore National Lab., CA (USA)). 10 Jan 1983. Contract W-7405-ENG-48. 109p. (UCRL—53038-Rev.1). NTIS, PC A06/MF A01 - GPO. Order Number DE83007347.

Part of the effort of the Seismic Safety Margins Research Program (SSMRP) has been directed at generating a fragility data base for equipment used in control and safety systems in commercial nuclear power plants. Component fragility data have been compiled in various forms, depending on their content, intended use, and level of reduction. The data are stored in a relational data base on the LLNL CEC 7600 computers; this provides easy accessibility for LLNL computer users. This report describes the present structure of the data base and presents its contents through the use of tables. This report is a revision of an earlier one of the same name and numbers (NUREG/CR-2680) and (UCRL-53038). Additional data have been included and the presentation has been revised to enhance its usability.

20718 (NUREG/CR—2800) Guidelines for nuclear-power-plant safety-issue-prioritization information development. Andrews, W.B.; Gallucci, R.H.V.; Heaberlin, S.W.; Bickford, W.E.; Konzek, G.J.; Strenge, D.L.; Smith, R.I.; Weakley, S.A. (Pacific Northwest Lab., Richland, WA (USA)). Feb 1983. Contract AC06-76RL01830. 273p. (PNL—4297). NTIS, PC A12/MF A01 - GPO $8.00. Order Number DE83008244.

Pacific Northwest Laboratory has developed a methodology, with examples, to calculate - to an approximation serviceable for prioritization purposes - the risk, dose and cost impacts of implementing resolutions to reactor safety issues. This report is an applications guide to issue-specific calculations. A description of the approach, mathematical models, worksheets and step-by-step examples are provided. Analysis using this method is intended to provide comparable results for many issues at a cost of two staff-weeks per issue. Results will be used by the NRC to support decisions related to issue priorities in allocation of resources to complete safety issue resolutions.

20719 (NUREG/CR—2809-Vol.3) Aerosol Release and Transport Program. Quarterly progress report, July-September 1982. Adams, R.E.; Tobias, M.L. (Oak Ridge National Lab., TN (USA)). Mar 1983. Contract W-7405-ENG-26. 36p. (ORNL/TM—8397-Vol.3). NTIS, PC A03/MF A01 - GPO. Order Number DE83008030.

This report summarizes progress for the Aerosol Release and Transport Program sponsored by the Nuclear Regulatory Commission's Office of Nuclear Regulatory Research, Division of Accident Evaluation, for the period July-September 1982. Topics discussed include: (1) the source-term experimental program in the Fuel Aerosol Simulant Facility; (2) NSPP experiment 601 involving the generation of mixed concrete-iron oxide aerosols in steam; (3) small vessel tests of plasma torch techniques for concrete aerosols; (4) technical support work for the Marviken and DEMONA test progams; (5) core-melt experiments involving cesium vaporization and manganese release; (6) summaries of calculational results obtained in the ABCOVE exercise; (7) hot-film anemometer experiments on fan-mixer effects in the NSPP.

20720 (NUREG/CR—2849) Comparison of COMPARE and BEACON subcompartment analyses of Battelle-Frankfurt containment tests. Idar, E.S.; Lime, J.F.; Gido, R.G. (Los Alamos National Lab., NM (USA)). Jan 1983. Contract W-7405-ENG-36. 73p. (LA—9461-MS). NTIS, PC A04/MF A01 - GPO $5.00. Order Number DE83007959.

This report presents the results of computations performed with the COMPARE/MOD1 and BEACON/MOD3 computer codes for selected Battelle-Frankfurt loss-of-coolant accident experiments. COMPARE is used widely to perform nuclear power plant containment subcompartment analyses, and BEACON is an advanced multiphase, multidimensional best-estimate code. The objective of this study was to evaluate the margins of COMPARE calculations by comparing them with BEACON calculations and test data. The calculations were performed for the Battelle-Frankfurt D3, D6, and C9 tests. Descriptions of the two codes and the Battelle-Frankfurt experiments are included. Comparisons of the codes' calculations and experimental data for absolute pressure, differential pressure, and temperature are presented for margin evaluation. Evaluations of the sensitivity of BEACON calculations to variations in model noding, form loss, and vent area modeling are prsesented. Conclusions summarizing the results of the COMPARE margin evaluation and BEACON sensitivity studies are given as well.

20721 (NUREG/CR—3028) Review of the Limerick Generating Station Probabilistic Risk Assessment. Papazoglou, I.A.; Karol, R.; Shiu, K.; Fiarman, S.; Lederman, L.; Ludewig, H.; Pratt, W.T.; Bari, R.A. (Brookhaven National Lab., Upton, NY (USA)). Feb 1983. Contract AC02-76CH00016. 410p. (BNL-NUREG—51600). NTIS, PC A18/MF A01 - GPO $9.50. Order Number DE83008246.

A review of the Probabilistic Risk Assessment of the Limerick Generating Station was conducted with the broad objective of evaluating its risks in relation to those identified in the Reactor Safety Study (WASH-1400). The review included a technical assessment of the assumptions and methods used in the Limerick study. It also included a re-evaluation of the main results within the scope and general methodological framework of the study. This included both qualitative and quantitative analyses of accident initiators, data bases, accident sequences which result in core damage, core melt phenomena, fission product behavior, and offsite consequences. Specific comparisons were made between the Limerick study, the Brookhaven review, and the WASH-1400 reactor for the core damage frequency and the average frequencies of acute and latent fatalities. The effect of uncertainties was considered throughout the review process and the uncertainty bands for the risk indices were quantified.

20722 (NUREG/CR—3069-Vol.1) **Interaction of electromagnetic pulse with commercial nuclear-power-plant systems. Volume I. Executive summary.** Ericson, D.M. Jr.; Strawe, D.F.; Sandberg, S.J.; Jones, V.K.; Rensner, G.D.; Shoup, R.W.; Hanson, R.J.; Williams, C.B. (Sandia National Labs., Albuquerque, NM (USA)). Feb 1983. Contract AC04-76DP00789. 42p. (SAND—82-2738/1). NTIS, PC A03/MF A01 - GPO $4.75. Order Number DE83007880.

It has been recognized for many years that the detonation of a nuclear weapon at high altitude leads to the creation of an intense electromagnetic field of very short duration, the electromagnetic pulse (EMP). The EMP from a single burst at the proper altitude could induce large currents and voltages in electrical equipment over the entire continental United States. Commercial nuclear power plants are not required to have protection against EMP. Therefore, the study has the following objectives: determine the vulnerability of systems required for safe shutdown of a specific nuclear plant to the effects of EMP; establish how any safe shutdown systems vulnerable to EMP may best be hardened against it; and characterize to the extent possible, the effects of EMP on nuclear plants in general based upon the results for systems in the example plant. The systems of concern in an example plant were identified and defined. Then, estimates were made of the currents and voltages which might exist at key points if the plant were subjected to EMP. Concurrently, component damage thresholds were estimated. These two sets of estimates were combined to assess the vulnerability of selected components. Because nuclear plants are complex, a modest experimental program was conducted to verify (or reject) conclusions reached about signal distribution and attenuation in the plant electrical systems.

20723 (NUREG/CR—3069-Vol.2) **Interaction of electromagnetic pulse with commercial nuclear-power-plant systems.** Ericson, D.M. Jr.; Strawe, D.F.; Sandberg, S.J.; Jones, V.K.; Rensner, G.D.; Shoup, R.W.; Hanson, R.J.; Williams, C.B. (Sandia National Labs., Albuquerque, NM (USA)). Feb 1983. Contract AC04-76DP00789. 421p. (SAND—82-2738/2). NTIS, PC A18/MF A01 - GPO $11.00. Order Number DE83007881.

This study examines the interaction of the electromagnetic pulse from a high altitude nuclear burst with commercial nuclear power plant systems. The potential vulnerability of systems required for safe shutdown of a specific nuclear power plant are explored. EMP signal coupling, induced plant response and component damage thresholds are established using techniques developed over several decades under Defense Nuclear Agency sponsorship. A limited test program was conducted to verify the coupling analysis technique as applied to a nuclear power plant. The results are extended, insofar as possible, to other nuclear plants.

20724 (NUREG/CR—3126) **Semiscale Mod-2A Intermediate Break Test series: test-results comparison.** Boucher, T.J.; Dimenna, R.A. (EG and G Idaho, Inc., Idaho Falls (USA)). Jan 1983. Contract AC07-76ID01570. 51p. (EGG—2238). NTIS, PC A04/MF A01. Order Number DE83007847.

Results are presented from an analysis of Semiscale Mod-2A Intermediate Break Tests S-IB-1, -2, and -3. The tests were 100% (percentage of cold leg pipe flow area), 50%, and 21.7%, respectively, communicative cold leg break loss-of-coolant experiments. They were intended to provide reference data for evaluation and assessment of reactor safety code capabilities to predict integral blowdown, refill/reflood experiments for intermediate break sizes, and, particularly, to provide data to extend the code into the reflood regime. Comparisons of Semiscale intermediate break test results with those from large and small break tests provided characterization of the phenomena observed during the intermediate break tests. An additional objective of Test S-IB-3 was to provide reference data for comparison of Semiscale test results with results from LOFT Test L5-1 and LOBI Test B-R1M.

20725 (ORNL/TM—8554) **Comparative study of water boiling in a vertical tube under temperature-controlled or heat-flux-controlled boundary conditions.** Carbajo, J.J. (Oak Ridge National Lab., TN (USA)). Mar 1983. Contract W-7405-ENG-26. 35p. NTIS, PC A03/MF A01.

The Simulant Boiling Flow Visualization (SBFV) loop is an experimental facility where natural-convection boiling of water was accomplished in a transparent vertical tube by using hot glycerine; thus, direct observation was possible. As a result, heating was obtained through a temperature-controlled rather than a power-controlled boundary condition. To compare the SBFV data with previous experiments using a stainless steel test section and a power-controlled boundary condition, a comparative study of the effect on water boiling with the two different boundary conditions was performed. The computer program LOOP-W was used for this purpose. This program has been used successfully in analyzing data from the SBFV, and it was modified so that analogous cases could be run with the two different boundary conditions.

20726 (PNL-SA—10409) **Investigation of flow recirculation in a rod bundle during natural-convection flow and power transients.** Fort, J.A.; Bates, J.M.; Rector, D.R.; Khan, E.U. (Pacific Northwest Lab., Richland, WA (USA)). Jan 1983. Contract AC06-76RL01830. 45p. (CONF-830103—42). NTIS, PC A03/MF A01. Order Number DE83007053.

From 2. international topical meeting on nuclear reactor thermal hydraulics; Santa Barbara, CA, USA (11 Jan 1983).

An experimental investigation conducted at the Pacific Northwest Laboratory studied the flow recirculation phenomenon in a rod bundle during natural-convection flow and power transients. The experimental data were used to validate the recirculation model in the COBRA-WC computer program. The COBRA-WC code was then used to predict the flow and temperature fields in a prototypic Liquid Metal Fast Breeder Reactor (LMFBR) blanket assembly for a worst-case, natural-convection transient. The geometry of the 2 x 6 rod bundle was chosed to facilitate direct velocity measurements by Laser Doppler Anemometry (LDA). The rod bundle power skews ranged from uniform bundle power to 1:0, including 2:1, 3:1, 4:1, and the bundle average Reynolds number ranged from 1400 to 200 for steady flows as well as for a number of 45-sec flow transients. Application of the COBRA-WC code to a prototypic blanket assembly for a worst-case natural-circulation transient shows that, although flow recirculation does occur, the temperature in the recirculating channels is well below the peak assembly temperature.

20727 (PNL-SA—10557) **COBRA-WC pretest predictions and post-test analysis of the FOTA temperature distribution during FFTF natural-circulation transients.** Khan, E.U.; George, T.L.; Rector, D.R. (Pacific Northwest Lab., Richland, WA (USA)). 23 Jun 1982. Contract AC06-76RL01830. 7p. (CONF-830103—41). NTIS, PC A02/MF A01. Order Number DE83007045.

From 2. international topical meeting on nuclear reactor thermal hydraulics; Santa Barbara, CA, USA (11 Jan 1983).

The natural circulation tests of the Fast Flux Test Facility (FFTF) demonstrated a safe and stable transition from forced convection to natural convection and showed that natural convection may adequately remove decay heat from the reactor core. The COBRA-WC computer code was developed by the Pacific Northwest laboratory (PNL) to account for buoyancy-induced coolant flow redistribution and interassembly heat transfer, effects that become important in mitigating temperature gradients and reducing reactor core temperatures when coolant flow rate in the core is low. This report presents work sponsored by the US Department of Energy (DOE) with the objective of checking the validity of COBRA-WC during the first 220 seconds (sec) of the FFTF natural-circulation (plant-startup) tests using recorded data from two instrumented Fuel Open Test Assemblies (FOTAs). Comparison of COBRA-WC predictions of the FOTA data is a part of the final confirmation of the COBRA-WC methodology for core natural-convection analysis.

20728 (PNL-SA—10833) **CLEAR: a model for the calculation of evacuation-time estimates in Emergency Planning Zones.** McLean, M.A.; Moeller, M.P.; Desrosiers, A.E. (Pacific Northwest Lab., Richland, WA (USA)). Jan 1983. Contract AC06-76RL01830. 26p. (CONF-830126—2). NTIS, PC A03/MF A01. Order Number DE83007052.

From Conference on modeling and simulation on microcomputers; San Diego, CA, USA (27 Jan 1983).

This paper describes the methodology and application of the computer model CLEAR (Calculates Logical Evacuation And Response) which estimates the time required for a specific population density and distribution to evacuate an area using a specific transportation network. The CLEAR model simulates vehicle departure and movement on a transportation network according to the conditions and consequences of traffice flow. These include handling vehicles at intersecting road segments, calculating the velocity of travel on a road segment as a function of its vehicle density, and accounting for the delay of vehicles in traffice queues. The program also models the distribution of times required by individuals to prepare for an evacuation. CLEAR can calculate realistic evacuation time estimates using site specific data and can identify troublesome areas within an Emergency Planning Zone.

20729 **(UCID—19115-Rev.1) Technical evaluation report (Revision 1) on the proposed design modifications and technical specification changes on grid voltage degradation for the Peach Bottom Atomic Power Station, Units 2 and 3.** Selan, J.C. (Lawrence Livermore National Lab., CA (USA)). 11 Mar 1983. Contract W-7405-ENG-26. 14p. NTIS, PC A02/MF A01. Order Number DE83008427.

This report is a revision of the technical evaluation documented in a separate report dated November 3, 1981 (UCID-19115) on the proposed design modification and Technical Specification changes for the protection of the Class 1E equipment from grid voltage degradation for the Peach Bottom Atomic Power Station, Units 2 and 3. The review criteria are based on several IEEE standards and The Code of Federal Regulations. The evaluation compares the submittals made by the plant with the NRC staff positions and the review criteria. The evaluation finds that the proposed design modifications and the required changes to the Technical Specifications will ensure that the Class 1E equipment will be protected from sustained voltage degradation.

20730 **Post accident debris cooling.** Mueller, U.; Guenther, C. (eds.). Karlsruhe, Germany; G. Braun (1983). 378p. (CONF-820717—). Sheridan House Inc., 175 Orawaupum Street, White Plains, NY 10606 $30.00.

From PAHR information exchange conference; Karlsruhe, F.R. Germany (28 Jul 1982).

The meeting is considered a continuation of a series of four earlier Information Exchange Meetings on POST ACCIDENT HEAT REMOVAL (PAHR). The previous meetings were organized by Sandia Laboratories at Albuquerque in 1974 and 1975, by Argonne National Laboratories in 1977, and by the Ispra Establishment of the Joint Research Center of the European Communities in 1978. The aim of the meeting was to summarize the present understanding of debris cooling phenomena and, moreover, to foster the exchange of information and ideas among specialists on PAHR-problems related to Fast Breeder and Light Water Reactors. Topics include: debris bed formation and debris bed properties; debris bed experiments and interpretation (LMFBR); heat removal from particle beds (LWR-HTR); experimental test facilities and programs; interaction of core debris with underlying structural materials; computation modeling of PAHR phenomena; and core debris retention concepts.

20731 **Post-service examination of the EBR-II superheater duplex tubes.** Longua, K.J.; Buzzell, J.A.; Porter, D.L. (Argonne National Laboratory, P.O. Box 2528, Idaho Falls, ID 83401). *Transactions of the American Nuclear Society;* **41**: 301(Jun 1982). (CONF-820609—).

From American Nuclear Society annual meeting; Los Angeles, CA, USA (6 Jun 1982).

20732 **Federal radiological assistance.** Combs, G. *Transactions of the American Nuclear Society;* **41**: 422(Jun 1982). (CONF-820609—).

From American Nuclear Society annual meeting; Los Angeles, CA, USA (6 Jun 1982).

20733 **(ORNL-tr—4960) Influence of cladding on the values of K_1 for emerging defects in the vessel belt line: semi-elliptical flaws; longitudinal flaws.** Lance, C.; Robisson, F.; Pellissier-Tanon, A. (Oak Ridge National Lab., TN (USA)). 1982. Contract W-7405-ENG-26. Translation source information not available . 96p. NTIS, PC A05/MF AO1. Order Number DE83007240.

While the usual analyses done on nuclear components account well for the presence of the cladding in the thermoelastic analyses, the calculation of K is generaly done, on the other hand, ignoring the presence of the latter (presence of cladding). The purpose of this study is to give the order of magnitude of the influence of the cladding on the K_1 observed for an emerging defect on the internal skin, longitudinal or semi-elliptical, and accounting for the real state of stresses observed in the cladding and the base metal. The discontinuity of stresses at the interface of the stainless steel and base metal due to different coefficients of thermal expansion is accounted for. The effect of residual stresses after final stress relieving treatment is also considered. The case of the core ferrule (belt line) subjected to a LOCA (Loss of Coolant Accident) is studied.

2505 Flywheels

20734 **(PB—82-232919) Physical properties data compilations relevant to energy storage. V. Mechanical properties data on alloys for use in flywheels.** Ledbetter, H.M. (National Measurement Lab. (NBS), Washington, DC (USA)). [nd]. 38p. NTIS, PC A03/MF A01.

This report deals with the physical and mechanical properties of twenty-one commercial alloys that are candidates for flywheel rotors used as inertial-energy-storage systems. Base metals include aluminum, iron, and titanium. Alloys vary in complexity from simple carbon steels to superalloys. Properties include: mass density, Young's modulus, shear modulus, bulk modulus, Poisson's ratio, yield strength, ultimate strength, fatigue strength, fracture toughness, and creep strength. Property values were collected from many types of sources and were analyzed statistically to detect possible outlying values. For each alloy, the report contains typical chemical composition, typical heat treatment, metallurgical descriptions, and typical property values. The report also shows the variations of these properties and the relative abundances of experimental property values. (Copyright (c) 1982, by the Secretary of Commerce on Behalf of the United States Government.)

20735 **(PB—82-238130) Stationary flywheel energy storage systems. Final report.** Gilhaus, A.; Hau, E.; Gassner, G.; Huss, G.; Schauberger, H. (Maschinenfabrik Augsburg-Nuernberg (M.A.N.) A.G., Muenchen (Germany, F.R.)). Jul 1982. Translation of Stationare Schwungrad-Energiespeicher, n.p., 1981.;. 111p. NTIS, PC A06/MF A01.

Advance in materials, e.g., the development of high-strength fiber composite materials, today makes possible the building of flywheel storage systems with high energy storage densities. A report is given of a study intended to discover industrial applications of Stationary Flywheel Energy Accumulators. The economic value for the consumer and the effects on the power supply grid were investigated. Up to now, Stationary Flywheel Energy Accumulators have only had limited use. The main reason for thinking of the application in a wider range was the hope that they could be used economically for lowering the demanded maximum output of the power supply grid. The possible savings in energy costs however, have proved to be too small for recovering the investment costs. An additional possibility for energy storage by flywheels exists where energy otherwise lost can be used effectively is brake energy storage in vehicles. The future use of flywheels in wind power plants also seems to be promising. Attractive savings of energy can be obtained by introducing modern flywheel technology for emergency power supply units which are employed, for instance, in telecommunication systems.

2506 Thermal

20736 (CONF-810940—13) **Development of natural stratification technology.** Cole, R.L. Bellinger, F.O. (Argonne National Lab., IL (USA)). 1981. Contract W-7405-ENG-26. 9p. NTIS, PC A02/MF A01. Order Number DE82000117.

From Annual contractors' review meeting on thermal and chemical storage; Tysons Corner, VA, USA (16 Sep 1981).

The development of natural stratification of water in sensible heat storage tanks is studied, and comparisons of experimental data with diffusion theory equations are made. A simple 1-D model of stratification that gives good results is presented and verified with measured tank performance. A stratification index is introduced that allows a rapid comparison to be made of tank performance data. A semi-empirical equation is given that will allow a prediction to be made regarding the tank operating performance providing that an empirical constant related to the mixing heights may be evaluated. A method to estimate a value for the constant is given for the case of a tank with a side inlet and outlet. Implications of stratification in regard to overall system control strategy are discussed. The goal is to provide system designers with the guidelines necessary to assure the establishment and maintenance of stratification and to take advantage of it.

20737 (NP—3900022) **Layout of a latent heat storage system with finned tubes.** Wolff, D. (Dortmund Univ. (Germany, F.R.). Abt. Chemietechnik). 26 Oct 1980. 157p. (In German). NTIS (mf) (US Sales only).. Order Number DE83900022.

Thesis. Microfiche only, copy does not permit paper copy reproduction.

The theoretical and experimental investigations show by the example of Glauber's salt in a finned-tube latent heat storage vessel how heat transfer and storage capacity at charging and discharging depend on the variables of geometry, temperature, time and on the composition of the storing medium. By vertical arrangement of transversely finned tubes the separation problems occurring with Glauber's salt are solved insofar as the technical utilization of the latent heat of conversion corresponding to the complete conversion during charging and discharging not being possible, no decrease, of the reduced storage capacity, however, is found even after very many charging/discharging cycles. For the heat transfer during discharging correlations can be given on the basis of a model concept, be means of which a heat transfer coefficient, varying during the discharging process, can be predicted almost for the total range of discharge as a function of geometry, temperature and state of discharge. On the basis of the simple working formula for the heat transfer coefficient at crystallization of a latent heat storing medium the dynamic behavior of a compact finned-tube storage vessel can be predicted by means of a computer code. These means allow to perform the thermal design of a compact latent heat storage facility according to given design criteria accounting for economic aspects.

20738 (PB—82-232331) **Seasonal thermal storage: Swedish practice, developments and cost projections.** Margen, P. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1981. 33p. NTIS, PC A03/MF A01.

The report reviews the types of heat store being developed in Sweden for seasonal storage of heat. This type of storage allows summer excess heat from industrial waste heat plants, garbage burning plants and future central solar heat stations to be stored for winter use on district heating networks. Whereas above ground steel or concrete tanks are usually too expensive, insulated earth pits, uninsulated rock caverns and deep ground schemes using rock or clay promise to achieve sufficiently low costs to justify storage when supplied with free or cheap summer heat. For all these concepts demonstration plants have been or are being built in Sweden.

20739 (PNL—4587) **Aquifer thermal-energy-storage costs with a seasonal-chill source.** Brown, D.R. (Pacific Northwest Lab., Richland, WA (USA)). Jan 1983. Contract AC06-76RL01830. 65p. NTIS, PC A04/MF A01. Order Number DE83006700.

The cost of energy supplied by an aquifer thermal energy storage (ATES) system from a seasonal chill source was investigated. Costs were estimated for point demand and residential development ATES systems using the computer code AQUASTOR. AQUASTOR was developed at PNL specifically for the economic analysis of ATES systems. In this analysis the cost effect of varying a wide range of technical and economic parameters was examined. Those parameters exhibiting a substantial influence on the costs of ATES delivered chill were: system size; well flow rate; transmission distance; source temperature; well depth; and cost of capital. The effects of each parameter are discussed. Two primary constraints of ATES chill systems are the extremely low energy density of the storage fluid and the prohibitive costs of lengthy pipelines for delivering chill to residential users. This economic analysis concludes that ATES-delivered chill will not be competitive for residential cooling applications. The otherwise marginal attractiveness of ATES chill systems vanishes under the extremely low load factors characteristic of residential cooling systems. (LCL)

20740 (PNL-SA—11128) **United States Department of Energy aquifer thermal-energy-storage field-test facilities.** Raymond, J.R.; Allen, R.D.; Kanneberg, L.D. (Pacific Northwest Lab., Richland, WA (USA)). Jan 1983. Contract AC06-76RL01830. 11p. (CONF-830208—1). NTIS, PC A02/MF A01. Order Number DE83006615.

From 7. meeting of the IEA solar heating and cooling program; Innsbruck, Austria (5 Feb 1983).

The US DOE has two field test facilities (FTF) for measuring the performance of and technical problems associated with aquifer thermal energy systems (ATES). The high temperature (>100°C) FTF is on the University of Minnesota campus at St. Paul. The low temperature (<100°C) FTF is near Mobile, Alabama. The design and operation of the FTF's are discussed. (LCL)

2509 Batteries

20741 (AD-A—116381/5) **Studies leading to the development of high-rate lithium sulfuryl chloride battery technology. Quarterly report No. 1, 1 Sep-31 Dec 81.** Marikar, F. (Gould, Inc., Rolling Meadows, IL (USA). Gould Labs.-Energy Systems). Mar 1982. 56p. NTIS, PC A04/MF A01.

The overall aim of the program is an examination of the viability of an active electrolyte lithium/sulfuryl chloride battery system. The specific objectives are to quantify the stability of lithium in sulfuryl chloride solutions; explore the means to improve the stability of lithium; and establish the limits of performance of carbon/teflon cathodes in sulfuryl chloride electrolytes. During this quarter we measured the rates of corrosion of lithium in sulfuryl chloride in cells and sealed capsules by microcalorimetry; estimated by complex plane impedance measurements; followed the growth of the film on cell storage, its disruption on polarization and its healing following polarization; established the baseline cathode performance; and measured the conductivity and density of SO_2Cl_2-$LiAlCl_4$ electrolysis at ambient and high temperature.

20742 (BMFT-FB-T—81-053) **Development of gas phase metallized plaques for electrodes of storage batteries, in particular for nickel oxide electrodes. Final Report, Jul. 1979.** Linkohr, R.; Schladitz, H. (Deutsche Automobilgesellschaft m.b.H., Esslingen (Germany, F.R.)). Jun 1981. 87p. (In several languages). NTIS, PC A05/MF A01.

Nickel oxide electrode plaques for alkaline batteries were developed by nickel carbonyl vapor deposition plating on large fiber plaque substrates made of carbon. The most promising technique is the one in which carbonyl gas flows continuously through the carbon felt, allowing continuous processing as well as improved uniformity of the nickel distribution. Structural strength, electrical resistance, heat conduction, and gas permeation of the plaques were approximated by simple models which are borne out by experimental comparison it is indicated that electrochemical measurements in half cell arrangements are reached for nickel savings, capacity per unit area, and current capability. (ESA)

20743 **(BMFT-FB-T—81-100) Nickel-iron battery of high energy density. Final Report, Jul. 1980.** Kraemer, G.; Oliapuram, V.A.; Lexow, K.W.; Horn, K.G. (Varta Batterie A.G., Kelkheim (Germany, F.R.). Forschungs- und Entwicklungszentrum). Jul 1981. 163p. (In several languages). NTIS, PC A08/MF A01.

The energy and power densities of conventional Nickel-Iron accumulators at about 26 wh/kg (5 h) and 18 w/kg (1 h) respectively are rather low. By using active materials of high utilization, electrode construction with low-weight support, light cell containers, and less electrolyte with gas recombination specific values of 45 wh/kg (5 h) and 35 w/kg (1 h) can be obtained as well as short-time load peaks of about 100 w/kg. An elastic casing is an essential feature of the new battery. The reversible pressure-volume changes can be used as a state-of-charge indicator. Production procedures, experimental results and recommendations for use are given. A 1 kwh battery has been completed.

20744 **(CONF-821106—28) In-situ determination of dimensional changes of electrodes in LiAl/FeS cells during cycling.** Shimotake, H.; Anderson, K.E.; Gay, E.C. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 31p. NTIS, PC A03/MF A01. Order Number DE83007730.

From Annual meeting of heat transfer and energy conversion; Los Angeles, CA, USA (14 Nov 1982).

The positive and negative electrodes of Li-Al/FeS cells undergo unique dimensional changes during cycling. Quantitative measurements of such changes are important in order to improve the cell designs and operational modes. The electrode behavior during cycling was monitored by a high sensitivity transducer. Changes in dimension were measured to the nearest +-2 μm in situ.

20745 **(CONF-821211—5) NASIGLAS electrolyte for sodium/sulphur cells.** Susman, S.; Nelson, P.A. (Argonne National Lab., IL (USA)). Oct 1982. Contract W-31-109-ENG-38. 8p. NTIS, PC A02/MF A01. Order Number DE83007636.

From 5. DOE battery and electrochemical contractors' conference; Crystal City, VA, USA (7 Dec 1982).

NASIGLAS compositions corresponding to the stoichiometries Na/sub 1+x/Zr/sub 2-x//$_3$Si/sub x/P/sub 3-x/O/sub 12-2x//$_3$ have been prepared by batch pressing from a 1600 to 1650°C melt. The range of compositions extends from $x = 3$ to $x = 2.25$. Evidence of phase separation and crystallization become more apparent at the higher phosphate compositions. Optical microscopy and x-ray diffraction indicate trace quantities of γ-Na_3PO_4 at $x \leqq 2.5$. For $x=3$, the glass transformation temperature determined by DTA is 995 K and the crystallization temperature is 1250 K (measured at a heating rate of 25°C/min.). Ionic conductivities were measured by the complex admittance method and results are given. (WHK)

20746 **(CONF-8010159—14) Transient-current distributions in porous zinc electrodes in KOH electrolyte.** Liu, M.B.; Cook, G.M.; Yao, N.P. (Argonne National Lab., IL (USA)). 1980. Contract W-31-109-ENG-38. 36p. NTIS, PC A03/MF A01. Order Number DE83007684.

From Fall meeting of the Electrochemical Society; Hollywood, FL, USA (5 Oct 1980).

Transient-current distributions were measured in porous zinc electrodes at current densities ranged from 24 to 240 mA/cm^2 in 7.24 N KOH saturated with ZnO. The current distributions were highly nonuniform. The reaction penetration depth was initially about 0.015 cm and decreased gradually to about 0.008 cm at steady state. The current distribution change occurring during passivation of the electrode was measured. The analysis of the experimental data indicate that the high nonuniformity of current distributions was due to high electrolyte resistance compared with both the charge-transfer resistance and the diffusion resistance of OH$^-$ ions. A model incorporating a surface blockage mechanism by compact ZnO formation did not completely predict the observed passivation behavior of the electrode. It was suggested that the passivation of the electrode may have been caused by pore plugging.

20747 **(CONF-8105105—6) Effect of electrolyte conductance on current distribution in porous zinc electrode in KOH electrolyte.** Liu, M.B.; Cook, G.M.; Yao, N.P. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 11p. NTIS, PC A02/MF A01. Order Number DE83007646.

From Symposium on electrocatalyis; Minneapolis, MN, USA (10 May 1981).

An analysis of the current distributions in porous zinc electrodes is presented which indicates that the current distributions are indeed controlled by the conductivity of the electrolyte within the porous structure. (WHK)

20748 **(DOE/ET/29368—T13) Modeling and computerized characterization of lead-acid battery discharges. Battery Energy Storage Test (BEST) Facility.** Hyman, E.A. (Public Service Electric and Gas Co., Newark, NJ (USA)). Jan 1983. Contract AC02-76ET29368. 92p. NTIS, PC A05/MF A01. Order Number DE83008368.

Characterization of the discharge performance of large-scale, lead-acid battery subunits has been implemented at the BEST Facility via computer-adjusted parameter values of a new empirical performance model fitted to time-series data for each subunit. The model, which includes relaxation effects, accurately fits electrical behavior during various time-varying current discharges: very deep discharges, interrupted discharges, high start/low finish, high finish/low start, parabolic and rapid sinusoidal current variations. Cell data fitted was obtained from cells of four different sizes, two of which are antimony grid and two of which are calcium grid. Sample applications illustrating the usefulness of the model, and a discussion of characterization methodology results are presented. This report is produced at a time when routine battery cycling at the BEST Facility is beginning. The BEST Facility data set analyzed is limited (ten discharges). This report, therefore, emphasizes validation of the techniques used. It is expected that substantive results from use of the characterization technique will be available in about one year.

20749 **(DOE/ET/29368—T14) SCOPE: the BEST facility data analysis and reporting system. Battery Energy Storage Test (BEST) Facility.** Hyman, E.A. (Public Service Electric and Gas Co., Newark, NJ (USA)). Jan 1983. Contract AC02-76ET29368. 29p. NTIS, PC A03/MF A01. Order Number DE83008392.

The Battery Energy Storage Test (BEST) Facility is a national test facility for battery energy storage systems. SCOPE is the BEST Facility data storage and analysis system. SCOPE is an acronym standing for STORE - CHARACTERIZE - ORGANIZE - PRESENT - EVALUATE. The term SCOPE SYSTEM denotes hardware, system and applications software, procedures, and personnel assembled to support the data processing needs of BEST Facility operation. This report is not a technical manual nor is it a user manual. This document is intended to describe what the SCOPE system is and what it can do. This report addresses the new or prospective user. (WHK)

20750 **(EUR—7595-EN/Vol.2) Advanced electrochemical energy storage devices.** Tofield, B.C. (Commission of the European Communities, Luxembourg). 1982. 264p. Available from the Commission of the European Communities, Luxembourg.

The introduction of electric vehicles is of particular importance to Europe where there is a special need to economise in oil consumption for strategic and economic reasons, and for long-term resource conservation. The development of improved batteries is the most urgent need to facilitate the more widespread acceptance of electric vehicles in the market-place. Other important reasons for supporting battery development are to facilitate the operations of electric utilities, and for providing storage capability for solar or wind-generated electricity. Our programme has the additional aim of assisting the European battery industry to satisfy the new demand in Europe and to compete for overseas markets. Battery-systems currently under engineering development are reviewed in Sub-Projet IV, cell configurations in Sub-Project II and electrolyte requirements in Sub-Project III and Sub-Project IV. Work on two advanced, high-temperature batteries, sodium-sulphur and lithium-iron sulphide, has been carried out within the frame of the European Communities' Research and Development Programme in Energy Conservation, 1975-79. All systems currently under development for vehicle propulsion pose such considerable technical or environmental problems that there can be no guarantee of any of them making a successful entry into the market-place. Similar drawbacks apply to batteries for utility applications and for storage of renewable energy.

20751 (NP—3900028) **Year-book of the Deutsche Gesellschaft fuer Chronometrie e.V. Vol. 32.** (Deutsche Gesellschaft fuer Chronometrie e.V., Stuttgart (Germany, F.R.)). 1981. 148p. (In German). NTIS (US Sales Only), PC A07/MF A01. Order Number DE83900028.

When developing new energy sources the battery manufacturer has to observe the various operating conditions to be applied like cell dimensions, load capability, energy density, self-discharge and operating voltage. The mutual dependence of desired cell properties will be discussed for alkaline systems, lithium systems as well as for solid electrolyte systems, which has to be observed in future time also in order to choose an adequate system that permits an optimal operation of the electronic wrist watch.

20752 (SAND—83-7013C) **Simple model of Exxon's Zn/Br_2 battery.** Van Zee, J.; White, R.E.; Grimes, P.G.; Bellows, R.J. (Texas A and M Univ., College Station (USA). Dept. of Chemical Engineering; Exxon Research and Engineering Co., Linden, NJ (USA). Advanced Energy Systems Labs.). 1983. Contract AC04-76DP00789. 26p. (CONF-830308—6). NTIS, PC A03/MF A01. Order Number DE83007839.

From American Institute of Chemical Engineers national meeting; Houston, TX, USA (27 Mar 1983).

A simple model of Exxon's Zn/Br_2 battery is presented and used to predict the energy efficiency of the battery for various electrolyte resistivities and cell geometries. Efficiencies of greater than 75% are predicted by the model.

29 ENERGY PLANNING AND POLICY

20753 (DOE/EIA—0205(82/4Q)) **Energy Information Directory. Fourth quarter 1982.** (National Energy Information Center, Washington, DC (USA)). 1982. 71p. NTIS, PC A04/MF A01. Order Number DE83008028.

This directory is a list of many of the government offices that are involved in energy matters. The offices are classified according to their specialities. For the purposes of this publication, each office has been given an alphanumeric identification symbol (A-01, A-02, etc.). The subject index uses these identification symbols instead of page numbers in referring the reader to relevant entries. Most entries provide an abbreviated office address. For the complete address, consult the Index of Building Locations. Following the name and title is the DOE routing symbol which refers to the organization and is a part of the mailing address.

20754 (DOE/TIC/EGC—82/4) **Energygrams: brief descriptions of energy technology.** (Department of Energy, Oak Ridge, TN (USA). Technical Information Center). 1982. 100p. (PB—82-903604). NTIS $8.00.

Energygrams: Brief Descriptions of Energy Technology, is a compilation of technical notes (called Energygrams) published by the Technical Information Center. The Center instituted the Energygram program to help fulfill a mission of the US Department of Energy (DOE) to transfer information and technology generated from DOE-sponsored research to identifiable audiences in industry, education, and federal, state, and local government. The Technical Information Center routinely screens all DOE R and D reports to identify appropriate information. It also coordinates with DOE and DOE laboratory and contractor program managers in identifying research and development projects for the transfer program and in reviewing the technical content of Energygrams before publication.

20755 (ESC—22) **Integral energy scenarios and models for the Netherlands.** van Oostvoorn, F. (ed.). (Karlsruhe Univ. (TH) (Germany, F.R.). Inst. fuer Beton und Stahlbeton). Nov 1982. 161p. (In Dutch). NTIS (US Sales Only), PC A08/MF A01. Order Number DE83901340.

In 1980 an informal Working Group on Integral Energy Scenarios (WIES) was formed to present a framework for discussion on scenarios. To exchange insights and know-how on scenarios a number of lectures were given by different members. This has now resulted in a collection of papers on scenarios and their models. This report contains an overview, followed by a collection of invited papers. The papers aim at giving background information of several scenarios and energy models. Five studies of scenarios are presented. Chapter one contains a short description of a study on long term socio-political developments in the Netherlands. This study starting with the policy environment of scenarios will soon be published. Two energy models, a simulation model and an L.P.-model, are presented in chapter two and three. Also two input-output models are presented in chapters four and five. Chapter six contains a description of models and methods used to estimate long term supply and demand of natural gas. In chapter seven the planning tools and methods used for estimation of long term electricity supply are shown. A low energy growth scenario is described in chapter eight. This scenario is supported by no-nuclear groups and environmentalists. Finally, chapter nine shows a complete energy scenario developed by the Ministry of Economic Affairs.

2901 Energy Analysis And Modeling

20756 (AD-A—121950/0) **Energy forecasting models within the Department of the Navy. Master's thesis.** Buttolph, L.W. (Naval Postgraduate School, Monterey, CA (USA)). Jun 1982. 307p. NTIS, PC A14/MF A01.

Executive Order 12003 requires that all federal activities reduce their energy consumption by 20% from fiscal year 1975 by fiscal year 1985. The Defense energy Information System (DEIS II) provides a system of measuring, reporting, and comparing energy use levels in pursuit of that goal. The use of regression and time series models of energy use were examined for application within the present DEIS II system. A data base of monthly electricity use, gross floor areas , four weather variables, and building area category identification codes were used in a framework study of 12 Naval Regional Medical Centers. Specific methodologies for model development, interpretation, and application to a control system are demonstrated and discussed.

20757 (DOE/EIA—0202/9-2) **Short-term energy outlook. Volume II. Methodology.** (USDOE Energy Information Administration, Washington, DC. Office of Energy Markets and End Use). Nov 1981. 86p. NTIS, PC A05/MF A01. Order Number DE83008096.

Analytical techniques and methodologies used to prepare the short-term energy forecasts published in Volume I of the November 1981 Outlook are presented. This technical presentation is intended for those readers interested in details of the methods behind the forecasts published in Volume I.

20758 (DOE/EIA—0267, pp 8-144) **Overview of the arc forecasts.** 1980. NTIS, PC A99/MF A01.

In Annual report to Congress, 1979. Volume 3. Projections; energy programs/energy markets-overview; energy programs/energy markets-technical papers.

This chapter groups discussion of energy projections by EIA division directors in charge of coordinating these, as well as independent energy analysts. (PSB)

20759 (DOE/EIA—0267, pp 145-233) **Oil and gas.** 1980. NTIS, PC A99/MF A01.

In Annual report to Congress, 1979. Volume 3. Projections; energy programs/energy markets-overview; energy programs/energy markets-technical papers.

This chapter discusses work done in oil and gas area by US EIA. Panel reviews are presented by L.A. Rapoport, B.C. Ball, R. Griffin, R.D. Guerin, E. Murphy, R.C. Sparling, and David Lindahl. (PSB)

20760 (DOE/EIA—0267, pp 344-390) **Macroeconomic effects.** 1980. NTIS, PC A99/MF A01.

In Annual report to Congress, 1979. Volume 3. Projections; energy programs/energy markets-overview; energy programs/energy markets-technical papers.

An overview of the macroeconomic elements in energy forecasting is presented. Panel members were: W. Curtis, K.A. Mork, S. Thurman and R. Dohner. (PSB)

20761 (DOE/EIA—0267, pp 391-465) **Demand.** 1980. NTIS, PC A99/MF A01.

In Annual report to Congress, 1979. Volume 3. Projections; energy programs/energy markets-overview; energy programs/energy markets-technical papers.

Parameters that are used for constructing energy demand models are presented by T. Morlan and reviewed by a panel consisting of R. Itteilag, W.R. Patterson, M. Rodekohr, R. Halvorsen, and J. Neri. (PSB)

20762 (DOE/EIA—0267, pp 466-489) **Welcome and introduction to review of energy policy study.** 1980. NTIS, PC A99/MF A01.

In Annual report to Congress, 1979. Volume 3. Projections; energy programs/energy markets-overview; energy programs/energy markets-technical papers.

An overview of EIA policy making and forecasting energy use is given. The role of the panelists in defining EIA's policy limits and comparing how that policy interacts with other energy programs is given. (PSB)

20763 (DOE/EIA—0267, pp 490-511) **Political and policy perspectives on the report's findings.** 1980. NTIS, PC A99/MF A01.

In Annual report to Congress, 1979. Volume 3. Projections; energy programs/energy markets-overview; energy programs/energy markets-technical papers.

This chapter addresses the attempt to extrapolate the effects that would have followed if a different energy policy had been chosen. Conclusions were it was an impossible task. (PSB)

20764 (DOE/EIA—0267, pp 512-564) **Energy policy in managing the transition.** 1980. NTIS, PC A99/MF A01.

In Annual report to Congress, 1979. Volume 3. Projections; energy programs/energy markets-overview; energy programs/energy markets-technical papers.

Government's role in energy policy is discussed using the Applied Analysis Program as a basis. More emphasis on emergency plans was urged. A deficiency in the focus of the study was seen as a failure to define the government role in urging the market toward its stated policy goals. (PSB)

20765 (DOE/EIA—0267, pp 565-630) **Energy policy and other national concerns.** 1980. NTIS, PC A99/MF A01.

In Annual report to Congress, 1979. Volume 3. Projections; energy programs/energy markets-overview; energy programs/energy markets-technical papers.

Effects of the interrelation between energy policy and income distribution, macroeconomics and inflationary interrelations, and the interaction with environmental problems are discussed. Panel speakers are: R.H. Haveman, L. Ruff, D.W. Jorgenson, B. Bosworth, and L.C. Thurow. (PSB)

20766 **(EUR—6762-FR-Vol.3) Development of optimization model for energy system program analysis and models of energy systems.** (Institut Economique et Juridique de l'Energie, Grenoble (France)). 1980. 61p. (In French). European Community Information Service, 2100 M Street, NW, Suite 707, Washington, DC 20037.

20767 **(PB—82-221714) The energy supply model 'MESSAGE'. Final report.** Schrattenholzer, L. (International Inst. for Applied Systems Analysis, Laxenburg (Austria)). [nd]. 42p. NTIS, PC AE03/MF E03.

This report describes the general form of an energy supply model called MESSAGE (Model for Energy Supply Systems And their General Environmental impact). MESSAGE is a dynamic linear programming model minimizing total costs of energy supply over a given time horizon. It balances secondary energy demand with primary energy supply. The model permits definitions of load regions, distinguishes between indigenous and imported resources, and takes account of the environmental impact of energy supply strategies. The most important application of MESSAGE is in the description of the IIASA global energy scenarios. A set of models and formalized procedures, each describing one part of the energy system, is arranged as a loop. Iterative application of the model loop leads to globally consistent scenarios in the development of the global energy system. The important relation for MESSAGE in this loop is with the energy demand model MEDEE-2 which provides the demand data for MESSAGE. Information on energy costs flows back to the demand model. MESSAGE can be used as a stand-alone model, and can also be applied to geographical regions other than the world regions of the global study.

20768 **(PB—82-227208) Long-term alternative energy R and D strategies. Final report.** (Commission of the European Communities, Luxembourg). [nd]. 52p. NTIS, PC AE04/MF E04.

A previous study by the Institute for Applied Systems Analysis dealt in detail with the long-term global energy problem. The present study represents an attempt to transfer the global results to the lower level of the 'sub-region' comprising the European Community so that they may be used as an interface between global and national levels. A further aim is to identify long-term energy R and D strategies for selected European countries which would be consistent with the global scenarios already identified. The on-going analysis is based on previously reported results of model runs for the energy/demand balance of 'Region III', comprising Western, Northern and Southern Europe, Japan, Australia, New Zealand, Oceania, Israel and South Africa, as well as for the energy/supply balance of nine European countries. The first stage was the disaggregation of the economic growth and energy demand and of the energy supply systems of Region III into sub-regions, one of which represents the EEC. Appendix 1 contains the results of the re-calculation of the final energy demand spectrum for the 50 year period until 2030. Appendix 2 contains the results of a re-calculated energy supply pattern for the sub-regions.

20769 **Energy analysis: as an economic tool.** Slesser, M. Ispra, Italy; Commission of the European Communities (1979). 67p. (EUR—6387-EN). European Community Information Service, 2100 M Street N.W., Suite 707, Washington, DC 20037.

Energy analysis is about estimating the energy resource required to make a given good or service available on the market place, and then interpreting that information within a theoretical framework. The methodology is established, and fairly widely accepted among the scientific community if not within the economic community. Differences still exist with respect to system boundary, but these are slowly being resolved.

20770 (CONF-811275—1) Energy-pricing policies and their implications: a case study for a planned economy. Liu, B.; Wyant, F. (Oklahoma City Univ., OK (USA); Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 25p. NTIS, PC A02/MF A01. Order Number DE83007824.

From Allied Social Science Association annual meeting; Washington, DC, USA (28 Dec 1981).

The primary objective of this study is to illustrate a benefit-cost cross-impact assessment framework by which the positive and negative impacts of energy pricing subsidies versus the proposed marginal cost pricing in developing countries in general and those in Egypt in particular are delineated. The varying impacts of the two energy pricing policies in Egypt are compared and evaluated quantitatively. In addition to the direct impacts of domestic energy pricing policies, the indirect effects of these policies on US energy pricing policy options and international energy resources development alternatives are examined. In summary, the preliminary study findings seem to be in favor of the marginal cost pricing policy over the existing public subsidies in Egypt as far as the energy planning goals or objectives for the country are concerned. However, it should be stressed that this study is more of a conceptual evaluation focusing on methodological development than an empirical or statistical assessment for Egypt, due to both data deficiencies and study limitations.

20771 (DOE/EI/10750—T1) Establishment of leading energy indicators. Final report. (Triton, Washington, DC (USA)). 14 Dec 1981. Contract AC01-80EI10750. 48p. NTIS, PC A03/MF A01. Order Number DE83007184.

Using financial and operating data collected by the Financial Reporting System (FRS) of DOE from energy producing firms, a methodology for analyzing energy time series was developed around the National Bureau of Economic Research (NBER) Algorithm for identifying cycles and identifying lead-lag relationsips. Although current FRS data are insufficient for this purpose, it is anticipated that the potential indicators will evolve with improved data compilation. (PSB)

20772 (DOE/EIA—0349/2) Energy company development patterns in the postembargo era. An overview of financial performance, 1974-1980. Volume 2, statistical tables. (Department of Energy, Washington, DC (USA). Energy Information Administration). Oct 1982. 117p. NTIS, PC A06/MF A01. Order Number DE83008002.

Aggregate financial and operating data were reported by the 26 major energy companies in tabulated form. The purpose of the second volume is to make the aggregate financial and operating data readily available to analysts and policy-makers, in both the private and public sectors, who have an interest in energy and financial performance. This report provides information useful for the development of energy and financial policy both in the public and private sectors. Economic performance, in financial and physical dimensions, continues to serve as the most significant factor in evaluating past decisions and guiding future options in the development and supply of energy resources. The information contained in this report is intended to promote an understanding and a critical review of the motivations and consequences of corporate investment decisions in the energy area.

20773 (EPRI-EA—2837) Air-pollution damage to man-made materials: physical and economic estimates. Final report. Stankunas, A.R.; Unites, D.F.; McCarthy, E.F. (TRC Environmental Consultants, Inc., East Hartford, CT (USA)). Feb 1983. 85p. NTIS, PC A05/MF A01. Order Number DE83901464.

This report considers the damage to three materials from SO_2 air pollution in a northeastern urban area (Boston). The three materials studied were paint, galvanized steel, and structural concrete (exclusive of paving). Using a field survey of 357 individual sites, the study estimated the quantities of these materials exposed to different concentrations of SO_2 for the entire urban study area and for the neighborhoods. Given the quantities of exposed materials, the study attempted to present economic estimates of the damage from SO_2 to the study materials. No adequate damage function could be found for concrete; hence, no estimate of the SO_2 damage to concrete is possible. The damage to paint varied considerably depending upon the damage function used, thus reflecting the uncertainty of the estimate. For the entire urban study area, the annual damage to paint ranged from $830,000 to $31,300,000. For galvanized steel, the estimated annual damage from SO_2 for the total study area was only $335,000. Estimates of damage are also presented by neighborhood. Some of the fundamental concepts necessary for materials damage estimates are reviewed in an appendix to the report. There is also a discussion of several key papers that previously estimated material damage from SO_2.

20774 (HSDPD—9/UNUP-11) Goals, processes, and indicators of development: a project description. Galtung, J. (United Nations University, Tokyo (Japan)). 1978. 45p. United Nations University, Toho Seimei Building, 15-1 Shibuya 2-chome, Shibuya-ku, Tokyo 150, Japan.

The five features listed below were studied to contribute to new theories and practices of development: focus is on development of people in security, welfare, identity, and freedom; a developed country guarantees an acceptable minimum of these basic needs in conformity with constraints set by nature and ecological balance; a methodological emphasis on dialog between people and planners interacting to create a world network for integrated research projects. A suggested format for the first year is presented. (PSB)

20775 (PB—82-238676) Vehicle operating costs, fuel consumption, and pavement type and condition factors. Final report Sep 79-Oct 81. Zaniewski, J.P.; Butler, B.C.; Cunningham, G.; Elkins, G.E.; Paggi, M.S. (Texas Research and Development Foundation, Austin (USA)). Mar 1982. 375p. NTIS, PC A16/MF A01.

This report presents updated vehicle operating cost tables which may be used by a highway agency for estimation of vehicle operating costs as a function of operational and roadway variables. These results, partially based on fuel consumption tests on a group of late model vehicles and on a survey of truck fleet owners, are representative of the advancement in vehicle propulsion technology and increase in unit prices since the last comprehensive study of vehicle operating cost was conducted in the United States. To make the procedure flexible to changes in unit prices, consumption rates of the major vehicle cost components are presented in tables of constant speed on vertical grades, constant speed on horizontal curves, speed change cycles, and idling for each vehicle classification.

20776 Energy and education: planning for higher prices and potential shortages. Petrock, E.M.; Bauman, P.C. Denver, CO; Education Commission of the States (Jul 1982). 62p. (DOE/IR/10903—T1). Education Commission of the States, Suite 300, 1860 Lincoln St., Denver, CO 80295. Contract FG05-80IR10903.

This publication focuses on information generally not available in current energy plans: revised federal policies, characteristics of state energy contingency documents, planning considerations, fuel characteristics and energy supply management techniques. Also included are the conclusions and recommendations made by the State Energy and Education Task Force, chaired by the Honorable Richard D. Lamm, governor of Colorado, and composed of policy makers and experts in energy and education matters. The annotated bibliography lists sources of information for monitoring energy-related data, a sampling of state developed energy conservation and emergency plans and other related references.

REFER ALSO TO CITATION(S) 19578, 20292, 20624, 20773, 20837, 21026, 21680, 21690, 21692, 21748, 21815, 21816, 21817, 21820, 21821, 21830, 21831, 21844, 21845, 21846, 21847, 21851, 21882, 21888, 21889, 21990

20777 (CONF-820970—, pp A.3-A.25) **CO_2 research program of CEC.** Fantechi, R. (Commission of the European Communities, Brussels, Belgium). Feb 1983. NTIS, PC A23/MF A01.

From Carbon dioxide research conference: carbon dioxide, science and consensus; Berkeley Springs, WV, USA (19 Sep 1982).

Projects described relate to the global carbon cycle and possible climatic changes due to increased carbon dioxide concentration in the atmosphere. Parameters studies include ocean relationships, especially water-air interactions; environmental transport; atmospheric chemistry changes that may occur through pollution abatement efforts; synergistic effects of carbon monoxide, nitrogen oxides, and methane; stratospheric trends; forecasting greenhouse effects in Europe and globally; modeling ecological concentration from archival data; transport and interaction in subantarctica regions; socioeconomic impacts; and transport with minerals in major river systems. (PSB)

20778 (ORNL/TM—8310) **Wilderness designation of Bureau of Land Management lands and impacts on the availability of energy resources.** Oakes, E.H.; Voelker, A.H. (Oak Ridge National Lab., TN (USA); Science Applications, Inc., Oak Ridge, TN (USA)). Feb 1983. Contract W-7405-ENG-26. 101p. NTIS, PC A06/MF A01. Order Number DE83008306.

In 1964 Congress mandated the establishment of the National Wilderness Preservation System - a collection of federal lands dedicated to the preservation of selected parts of our once vast wilderness. Because wilderness management precludes many traditional land uses, controversy has plagued the efforts of land-management agencies to select and recommend areas for wilderness inclusion. This study examines potential impacts on the supply of energy resources from the possible withdrawal by the Bureau of Land Management (BLM) of some part of the 24.3 million acres of public lands now under study for inclusion in the wilderness system. Except for uranium, the energy-resource potential of the total WSA-acreage is low. Wilderness designation of some WSAs is therefore not expected to cause serious impacts on the future availability of energy resources. Because the significance of land withdrawals by the BLM will depend to some extent on the availability of other federal lands for mineral activities, an up-to-date estimate of the current and future status-of-access to western federal lands for mineral activities was prepared. Overall conclusions of the report are that (1) the inclusion of some BLM land in the National Wilderness Preservation System will not interfere with the nation's required supply of energy resources, (2) there is sufficient federal land currently available in the West for mineral activities, (3) the availability of western federal land for mineral activities will increase in the future, (4) the administration should continue to support the major land-review programs, and (5) the administration should accelerate the review process for WSAs in regions that have a high energy-resource potential.

20779 (PB—82-230459) **Research outlook 1982.** (Environmental Protection Agency, Washington, DC (USA). Office of Research and Development). Apr 1982. 135p. NTIS, PC A07/MF A01.

This edition is a five-year strategy document which describes how the EPA research program plans to address major issues. Each chapter relates to the research applicable to a segment of the Agency's regulatory program. Within each chapter, an introduction defines the area of concern, a section on legislated responsibilities indicates the laws which engender the research program and the body discusses major gaps in scientific and technical knowledge and how they are to be filled to assure a cost-effective regulatory program. The chapters also present selected milestones which indicate the timing of important segments of the research program and resource options for conditions of high, moderate and no growth. These growth scenarios are intended to indicate potential program increases in the Agency's research and development. The chapters in the report are: Energy, Hazardous Air Pollutants, Gases and Particles, Oxidants, Mobile Sources, Pesticides, Radiation, Toxic Chemical Testing and Assessment, Hazardous Wastes, Superfund, Drinking Water, Water Quality, Industrial Wastewater, Municipal Wastewater.

20780 (PB—82-237421) **AEROS manual series. Volume III: summary and retrieval manual. update number 2.** (Environmental Protection Agency, Research Triangle Park, NC (USA). Office of Air Quality Planning and Standards). Apr 1979. 345p. NTIS, PC A15/MF A01.

The AEROS Summary and Retrieval Manual (Vol. III) describes the reporting and analysis capabilities of the various AEROS systems. The reports available from each of the major systems are described and their retrieval options are explained. Sample computer printouts are used to illustrate the report formats. This manual also describes the analysis packages available for use in the evaluation of AEROS data and describes the user access procedures for obtaining AEROS reports. It describes the standard publications available from the NADB to provide information on emissions and air quality. It also provides specific examples of applications of AEROS data and the use of AEROS reports in typical air quality control activities. The manual also gives an overview of the Comprehensive Data Handling System (CDHS), which is an AEROS-related system for storing and reporting air quality and emission data.

20781 (CONF-8110257—1) **Partial-equilibrium model for long-term price and supply in world metal markets.** Macal, C.M.; Hill, L.G. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 29p. NTIS, PC A03/MF A01. Order Number DE83007668.

From ORSA/TIMS joint national meeting; Houston, TX, USA (11 Oct 1981).

This paper describes a model to estimate long-term world prices of metals that could be in short supply in the future. A time-stepped simulation model solves for market equilibrium prices and interregional flows in successive time periods using a quadratic programming algorithm. Preliminary results are presented on the application of the model to estimate price impacts of nickel requirements by nickel-zinc electric vehicle batteries. 5 figures, 3 tables.

20782 (GAO/RCED—83-6) **Analysis of the energy research and development budget proposal process.** (General Accounting Office, Washington, DC (USA). Resources, Community and Economic Development Div.). 5 Nov 1982. 26p. General Accounting Office, P.O. Box 6015, Gaithersburg, MD 20760.

Information on the energy research and development (R and D) budget proposal process is presented. In view of the magnitude of the proposed changes for fiscal year 1983 and the continuing congressional interest in the energy R and D area, we reviewed the process underlying the administration's fiscal year 1983 energy R and D budget proposal. This report describes: (1) how the fiscal year 1983 energy R and D budget was developed, (2) the roles played by the Department of Energy and Office of Management and Budget officials, and (3) factors that influenced decisions made on the budget.

20783 (ERG—035) **The nuclear controversy: unequal competition in public policy-making.** Sanderson, I. (Open Univ., Milton Keynes (UK)). May 1980. 76p. NTIS, PC A05/MF A01.

The public policy making process as regards nuclear power is analyzed and the epistemological basis for such an analysis is examined. It is asserted that disputes over the development of nuclear power are not primarily about the objective facts of the matter but rather derive from differences in basic assumptions about, and evaluatory perceptions of, society, technology and the nature of progress. The balance of power in such disputes is therefore not mainly determined by the 'correctness' of the facts upon which a position rests but rather by the extent to which underlying assumptions and values accord with prevailing ideological themes. A meaningful debate can be guaranteed only through the establishment of institutional structures which provide a framework of truely democratic participation and equality of power and influence.

20784 **Fusion: Where we are and where we're going.** Clarke, J.F.; Dowling, R.J. (Department of Energy, Washington, DC, (USA). Office of Fusion Energy). *Journal of Nuclear Materials;* **111**: vp(Nov-Dec 1982).

From 5. international conference on plasma surface interactions in controlled fusion devices; Gatlinburg, TN, USA (3 - 7 May 1982).

Status of the U.S. magnetic fusion energy program with respect to the Administration's position on fusion energy, composition and technical status of the program, and strategy for the future including a brief review of the 1983 budget are discussed.

20785 (GAO/EMD—82-110) **Analysis of two allegations about the Tennessee Valley Authority's energy-conservation programs and their efficiency and effectiveness.** (General Accounting Office, Washington, DC (USA). Energy and Minerals Div.). 11 Aug 1982. 7p. General Accounting Office, P.O. Box 6015, Gaithersburg, MD.

Two allegations were investigated regarding the Tennessee Valley Authority's energy conservation programs. Regarding the first allegation, it was found that TVA was slow to respons to a request for a home inspection that was necessary for the complainants to qualify for a low interest heat pump loan. TVA officials cited poor communications, abnormally large backlog, and loss of two energy advisors as circumstances contributing to the oversight. The second allegation was made by a former TVA energy advisor that he was fired for disclosing improprieties in the home insulation program. Two lawsuits resulted; the first seeking a copy of TVA's investigations of the complainant's charges, and the second asserting that the former employee had been defamed in a statement released to a local newspaper. Types of energy conservation programs sponsored by TVA are identified., as well as how the programs are organized and administered, and the scope of activity under each program. 9(LEW)

20786 (PB—82-238536) **Federal energy conservation programs. Perspectives from the public and private sectors: Volume I. Summary of a public hearing, July 14 and 15, 1981, Washington, DC.** (REAP Associates, Inc., Washington, DC (USA)). May 1982. 50p. NTIS, PC A03/MF A01.

Section 11 of the Federal Nonnuclear Research and Development Act mandates an annual public hearing on the adequacy of attention to energy conservation method and the environmental consequences of the application of energy technologies. This report summarizes the views of 88 individuals and groups who testified at the Section 11 hearing July 14 and 15, 1981 in Washington, D.C., or who submitted written testimony. The hearing focused on the federal governments' energy conservation programs. A wide range of opinions was presented including the views of utilities, trade groups, state and local governments, conservation businesses and advocacy groups. A complete transcript of oral and written testimony is available as Volume II of this report.

20787 (PB—82-238544) **Federal energy conservation programs. Perspectives from the public and private sectors: Volume II. Public hearing, July 14 and 15, 1981, Washington, DC.** (REAP Associates, Inc., Washington, DC (USA)). May 1982. 470p. NTIS, PC A20/MF A01.

The 1981 National hearing on Section 11 of the Federal Nonnuclear Research and Development Act was held July 14 and 15, 1981 in Washington, D.C. The hearing focused on the federal governments' energy conservation programs. This transcript presents the testimony of 88 individuals and groups who testified at the hearing, or who submitted written testimony. Testimony regarding issues discussed at the hearing included energy policy, benefits of energy conservation, state and local governments and private sector activities, successes and failures of federal programs, barriers to conservation and a continuing federal role. A summary of the oral and written testimony is available as Volume I of the report.

20788 (CONF-8110257—2) **Energy-sector-model applications in energy assessments of industrializing and developing countries.** Macal, C.M. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 39p. NTIS, PC A03/MF A01. Order Number DE83007685.

From ORSA/TIMS joint national meeting; Houston, TX, USA (11 Oct 1981).

A description is given of the use at Argonne National Laboratory of energy-sector models in national energy planning for developing and industrializing countries. An equilibrium approach is used to project future fuel prices and supplies. The methodology for developing and applying the models to Portugal, Argentina, and South Korea is discussed, based on the Argonne experience.

20789 (DOE/EIA—0008(82/3Q)) **Energy information. Quarterly report: third quarter, 1982.** (Department of Energy, Washington, DC (USA). Energy Information Administration). Dec 1982. 45p. NTIS, PC A03/MF A01. Order Number DE83008043.

Report to Congress.

This report contains energy information including imports of crude oil, petroleum products, natural gas, and coal; reserves and production of crude oil, natura gas, and coal; refinery activities; and petroleum inventories.

20790 (DOE/EIA—0267) **Annual report to Congress, 1979. Volume 3. Projections; energy programs/energy markets-overview; energy programs/energy markets-technical papers.** (Maryland Univ., College Park (USA). Coll. of Business and Management). 1980. Contract FG01-80EI10672. 712p. NTIS, PC A99/MF A01. Order Number DE83006457.

This contractor report is an edited transcript of the proceedings of a two-day symposium, held at the University of Maryland on August 7-8, 1980. The symposium was held in order to independently review the Energy Information Administration's (EIA) Annual Report to Congress, 1979 - Volume Three: Projections, Energy Programs/Energy Markets-Overview and Energy Programs/energy Markets-Technical Papers. These reports were delivered to the Congress and the public by August 1980. Participants included energy experts from academia, government and the private sector. The government sector was represented by local, state and federal government energy experts, most notable being EIA staff members from the Office of Applied Analysis. The symposium and these proceedings cover the underlying assumptions, methodologies, and energy system projections presented in the three reports.

20791 (DOE/EIA—0267, pp 1980) **Utilities.** 1980. NTIS, PC A99/MF A01.

In Annual report to Congress, 1979. Volume 3. Projections; energy programs/energy markets-overview; energy programs/energy markets-technical papers.

This chapter reviews the coal and electric utilities dispatch and capital expansion models. Forecasts are contrasted with 1978 figures and major changes which acted to influence the predicted consumption demand are discussed. Panel members were: R. Eynon, R. Gordon, F. Keady, M. Baughman, J. Karaganis, R.G. Clark, J.O. Roberts, J.J. McSweeny, and L. Mills. (PSB)

20792 **(EUR—7780-EN) Input data for the Federal Republic of Germany for the energy demand model MEDEE-3.** Ruehle, G.; Scheirle, N.; Thoene, E.; LeVan, T.; Zeidl, D. (Institut fuer Kerntechnik und Energiewandlung e.V., Stuttgart (Germany, F.R.)). 1982. 188p. European Community Information Service, 2100 M Street, N.W., Suite 707, Washington, DC 20037.

The report summarizes the results of an interdisciplinary national group of experts from the Federal Republic of Germany in the compilation of a data base for the energy demand model MEDEE-3. The IEJE provisional data base was examined, corrected, completed and validated.

20793 **(NP—3900159) Econometrical model of the energy demand of New York State.** Chatterji, M. (Muenster Univ. (Germany, F.R.). Sonderforschungsbereich 26 Raumordnung und Raumwirtschaft). Feb 1981. 26p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE83900159.

Some general remarks are made on energy scenarios in New York State and the econometrical model of the energy demand is described. The development of the pertinent equations is presented.

20794 **(NP—3901213) Texas energy history.** Burnett, D.R.; Chang, J. (Texas Energy and Natural Resources Advisory Council, Austin (USA)). Nov 1982. 114p. Texas Energy and Natural Resources Advisory Council, Energy Policy Div., 200 East 18th St., Austin, TX 78701.

This publication provides an overview of historical reserves, production, transmission, conversion, consumption, and valuation of energy in Texas. The Graphic Summary contains graphs comparing energy industry in the United States and Texas. Section II contains Texas data series from 1960 to the present.

20795 **(P—105-82-005) Securing California's energy future. Draft 1983 biennial report to the Governor and the Legislature.** (California Energy Resources Conservation and Development Commission, Sacramento (USA)). Nov 1982. 351p. California Energy Commission, 1516 Ninth Street, Sacramento, CA 95814.

The Draft 1983 Biennial Report assesses energy supply and consumption of resources available to California; evaluates ways in which projected energy consumption rates could be reduced through increased energy efficiency and conservation; assesses a variety of electricity and nongenerating energy technologies and the issues surrounding their development and commercial deployment; indicates the amount and types of new electrical generating capacity which may be needed to meet forecasted demand levels; and describes potentially adverse social, economic, and environmental impacts which could result from continuing current trends of energy supply and consumption.

20796 **(PB—82-217605) Energy models of European communities implementation and methodological tests in Italy. Final report.** (Commission of the European Communities, Luxembourg). 1981. 56p. (EUR—7289-EN). NTIS PC E04/MF E04.

The strategy employed to obtain a meaningful involvement of Italian users in energy model implementation together with the difficulties encountered are outlined. The methodological tests carried out on the EXPLOR and EFOM models are described in detail. The EXPLOR model is used to analyze energy demand for various sectors. Two EFOM models were analyzed, the first evaluating the behaviour of the model under reference conditions and the second evaluating alternative cases where variations have been added to take account of the costs of nuclear investment, the cost of imported crude oil and the constraints on coal imports. The results do not give meaningful indications for energy planning and decision making but can be regarded as a preliminary methodological exercise showing the capabilities and potentialities of the models. When properly used, the models should give a better understanding of the energy system structure, facilitate the evaluation of decision factors, improve energy policy planning and provide a reference energy system framework for arriving at a concensus on alternative strategies.

20797 **(PB—82-219262) Trends in energy demand in Italy (energy demand model for Italy). Final report.** (Commission of the European Communities, Luxembourg). [nd]. 152p. (EUR—7304-IT). NTIS PC E07/MF E07.

This report describes the research into an energy demand model (EDM) for Italy and its integration into the EEC model EXPLOR. The results of the research are described and discussed, and some suggestions for further areas of research are made. A detailed analysis is made of the EDM/Italy data base, trends in final demand of energy, EDM Battelle-Frankfurt results, a comparison of the Frankfurt and Cambridge models, and tables relating to the linkage from EXPLOR/EDM to EFOM 12CB.

2930 Policy, Legislation, And Regulation

REFER ALSO TO CITATION(S) 19746, 19961, 20055, 20210, 20762, 20763, 20765, 20777, 20783, 20790, 20794, 20795, 20812, 20813, 20815, 21888

20798 (DOE/EIA—0267, pp 631-679) **Wrap-up session on energy policy study.** 1980. NTIS, PC A99/MF A01.

In Annual report to Congress, 1979. Volume 3. Projections; energy programs/energy markets-overview; energy programs/energy markets-technical papers.

All panel moderators were given ten minutes to capsule their gleanings from the proceedings. The final chapter summarizes each panel members contributions to the meeting. (PSB)

20799 **(GAO/ID—82-60) Priority support for energy programs under the Defense Production Act.** (General Accounting Office, Washington, DC (USA)). 1982. 5p. US General Accounting Office, P.O. Box 6015, Gaithersburg, MD.

Administrative procedures used by the Departments of Energy and Commerce to implement section 101 (c) of the Defense Production Act of 1950 are presented, specifically as they pertain to priorities for steel to meet future energy requirements. Information obtained on the section 101 (c) program from the Commerce and Energy Departments indicates that its authority has been used sparingly and has not significantly affected producers and suppliers of domestic steel or other materials and equipment. From program inception in 1977 through June 30, 1982, the Energy Department received only 50 applications for priority rating; it sent 32 applications to Commerce for further processing, turned down 16 as not being eligible for priority rating, and still was processing 2 as of June 30, 1982. Commerce authorized priority ratings for 23 of the 32 applications and denied priority ratings for 9 of them. Of these 32 applications, 21 involved steel material; 13 of them related to Alaskan North Slope projects, 6 to coal projects, 1 to the Strategic Petroleum Reserve, and 1 to natural gas. Commerce authorized priority ratings for 14 of the 21 applications.

20800 (N—82-18707) **National energy research and development program.** (Serice de la Programmation de la Politique Scientifique, Brussels (Belgium)). 1980. 23p. (In French). NTIS, PC A02/MF A01.

This bibliography cites 24 reports generated by a program designed to study the national energy system, possibilities for energy conservation, and the use of new energy sources in Belgium. Topics covered include a mathematical model of the energy system social impacts regional aspects the energy infrastructure compatibilities, energy consumption in buildings and industries the use of solar energy heat recovery and storage and the use of fossil fuels.

20801 (NP—3901020) **Discussion on energy policy in the SPD.** von Oppeln, S. (Freie Univ. Berlin (Germany, F.R.). Fachbereich Politische Wissenschaft). 1980. 128p. (In German). NTIS (US Sales Only), PC A07/MF A01. Order Number DE83901020.

The project on democratic-socialist parties of Western Europe in the FGS Foreign Policy aims at analyzing actual sectors of policy after a phase of intensive theoretical work. It intends to perform systematic comparative studies on the policies of democratic-socialist parties e.g. in the central sectors of agriculture, environmental policy and energy policy. The present preliminary study is to be seen in this research context. As exemplified by the SPD the question for claims and reality, motives and interests of the discussion on energy policy of the SPD is asked. In this form, the study, as an interim result, can not yet do complete justice to the importance of the topic. It is an important approach to the publication of these Occasional Papers to animate the critical discussion on topical issues in research.

20802 (NP—3901671) **Development of standards and program packages. Volume III. Appendices. Final report, Phase 2.** McCarthy, P.M.; Barnes, H.H.; Londner, H.D.; Edmondson, S.E.; Friedlander, S.C. (Applied Management Sciences, Inc., Silver Spring, MD (USA)). 17 Sep 1982. 319p. NTIS, PC A14/MF A01. Order Number DE83901671.

Eighty-two implementation strategies are analyzed. Each summary description consists of the following elements: title of the strategy; description of the strategy; appropriate technologies; barriers designed to overcome; regional evaluations; policy interventions; summary results of the literature; and reference sources. Descriptions are grouped according to the eight market segments for which the strategies were designed: owner occupants, renters, and investors of the residential sector; owner occupants, renters, and investors of the commercial sector; and end-user, and intermediary of the government sector. (PSB)

20803 (PB—82-240045) **Analysis of state regulatory actions regarding rates for buyback electricity and back-up electric service for natural gas cogeneration. Final report.** Podlasek, R.J. (Podlasek (R.J.), Springfield, IL (USA)). Mar 1982. 52p. NTIS, PC A04/MF A01.

The objectives were: (1) To evaluate progress of state regulatory commissions in implementing rates for buyback electricity and back-up electric service for natural gas cogeneration, (2) to determine the underlying methodology utilized by state commissions in developing cogeneration rates, and (3) to identify cogeneration technical parameters which influence the magnitude of buyback and back-up rates.

20804 (PB—82-243072) **The automobile calendar: recent and pending federal activities affecting motor vehicles. Final report.** (Regulatory Council, Washington, DC (USA)). Jan 1981. 399p. NTIS, PC A17/MF A01.

This report provides a comprehensive review of current government activities intended to affect the manufacture, sale, and use of the automobile and other motor vehicles. It is intended to be a pilot, industry-specific calendar, modeled on the Council's Calendar of Federal Regulations, which is published twice a year, in May and November. While the Calendar of Federal Regulations covers only the most important regulatory activities affecting all industries, the Automobile Calendar covers all regulatory activities intended to significantly affect only one industry.

20805 (CONF-810631—7) **Optimum resource use in synfuels development.** Livengood, C.D.; Wilzbach, K.E. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 15p. NTIS, PC A02/MF A01. Order Number DE83007648.

From 74. annual meeting of the Air Pollution Control Association; Philadelphia, PA, USA (21 Jun 1981).

In this paper the question of optimum coal-resource use is examined. One conclusion is that electricity, substituted for oil or gas, is in some areas the most resource-efficient synfuel. The move toward the all-electric home, which has been the historical trend, should be encouraged. The development and commercialization of advanced, high-efficiency power plants will enhance the advantages of such increased residential electrification. The primary advantage will be the energy savings achieved by heat pumps, but other benefits may be anticipated as well, such as the optimization of energy conversion and pollution control at central installations. Direct use of coal should be encouraged at large commercial and industrial installations, where the amount of energy used justifies the additional complexity over gas/oil systems. Coal-derived liquids or gas appear attractive for industry only in existing units or in very small boilers. Fuel shortages may also be critical in transportation. If the petroleum supply is restricted, coal liquids and shale oil will be pressed into service for aircraft fuel and long-distance surface transport. One major source of lost coal energy not addressed here is the failure to extract all of the coal during underground mining. With traditional room and pillar mining methods, coal left in the ground may amount to as much as 50% of the known deposits. Technology advances in this area would greatly enhance resource utilization. In summary, we find that coal synfuels should be developed to cope with shortages of petroleum and natural gas that may arise as resources become depleted (or because of political upheavals). Energy policy-makers should pay greater attention also to the improvement of end-use technologies and the indications they give us for the most efficient use of our resources. 5 figures, 2 tables.

20806 (DOE/EIA—0167(81)P) **Domestic natural gas reserves and production dedicated to interstate pipeline companies, 1981 (preliminary report).** Arnold, J.R. (USDOE Energy Information Administration, Washington, DC. Office of Oil and Gas). 27 Jul 1982. 7p. NTIS, PC A02/MF A01. Order Number DE83008158.

This annual report provides preliminary information on the natural gas reserves of the interstate pipeline companies as requested by the FERC for regulatory purposes. A preliminary compilation of information reported by interstate natural gas pipeline companies to the Energy Information Administration (EIA) on FERC Form 15, Interstate Pipeline's Annual Report of Gas Supply, indicates that domestic natural gas reserves dedicated to the interstate market at the end of 1981 were 98.3 trillion cubic feet (Tcf), an increase of 1.2% from the 97.1 Tcf at the end of 1980. EIA's preliminary compilation indicates that the volume of natural gas produced from dedicated reserves in 1981 totaled 11.6 Tcf, approximately equal to the volume of natural gas produced during 1980.

20807 (GAO/RCED—83-10) **Interior's report of shut-in or flaring wells unnecessary, but oversight should continue.** (General Accounting Office, Washington, DC (USA). Office of the Comptroller General). 5 Oct 1982. 14p. General Accounting Office, P.O. Box 6015, Gaithersburg, MD 20760.

Report to The Congress.

The Interior Department's annual report to the Congress on offshore oil and gas wells shut-in (not producing) or flaring natural gas, as required by the Outer Continental Shelf Lands Act Amendments of 1978, does not satisfy the congressional intent behind the requirement. Furthermore, it is less necessary now because of recent legislative and administrative actions to decontrol oil and gas prices. Repeal of the reporting requirement would free up resources of both the Interior Department and the General Accounting Office - the Comptroller General is required to annually examine and report on Interior's methodology for allowing wells to be shut-in or flare natural gas - for other activities. Interior's monitoring of shut-in and flaring well activities, however, should continue as part of its day-to-day management and oversight of offshore production operations.

20808 **(IIM/IP—81-30) Vertical integration as a source of market power.** Phelps, J.H. (Wissenschaftszentrum, Berlin (Germany, F.R.). Internationales Inst. fuer Management und Verwaltung). Nov 1981. 67p. Available from Fachinformationszentrum Energie, Physik, Mathematik, Karlsruhe, Germany, F.R.

Discussion papers.

This paper has put forward a theory of vertial integration where the ability of a group of firms to engage in noncompetitive pricing is increased by altering conjectural variations. An analysis of conditions faced by major oil companies at refining indicated little likelihood of market power, short of a complex, secret price fixing agreement. Vertical integration to branded retail outlets appears to have created the ability to price noncompetitively without overt collusion. More interesting for vertical policy are the results on non price rivalry where excess profits appear to have been turned into social costs.

20809 **(KOM—(81)-229(endg.)) Substitution of coal for petroleum in 'other industries'.** (Commission of the European Communities, Strasbourg (France)). 6 May 1981. 52p. (In German). NTIS (US Sales Only), PC A04/MF A01. Order Number DE83750302.

The coal share of the primary energy consumption in the European Community has gone down from 57% in 1958 to 19% in 1978. What could motivate today the 'remaining industry' (beside energy sector, steel industry and small trade) to rearrange from crude oil or gas to coal again. Decision criteria can be divided into two groups, namely in technical and financial problems of each undertaking (1), as well as the surrounding data wreath (2). To (1) belong building and waste problems and investment and conversion costs, to (2) above all procurement problems and governmental contributions. Also political viewpoints (sure availability of coal) presumably will contribute to the final decision.

20810 **(NP—3900029) Energy reserves and energy conservation. Pt. 1.** Gruenhagen, J. (Deutsche Presse-Agentur G.m.b.H., Hamburg (Germany, F.R.)). 16 Feb 1981. 14p. (In German). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83900029.

A status report is given on the worldwide reserves of nonrenewable energy sources.

20811 **(NP—3900188) Report of the business year 1980 from 1st January until 31st December 1980.** (Badische Gas- und Elektrizitaetsversorgung A.G., Loerrach (Germany, F.R.)). 1981. 21p. (In German). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83900188.

The annual report of the company had been submitted at the regular general meeting on 1. July 1981. Some explanations on the annual account 1980 are given and the report of the supervisory board is presented. The report of the managing committee is chiefly related to the natural gas deal. The annual balance until 31st December 1980 as well as the profit and loss account are given in the appendix.

20812 **(PB—82-242926) Cooperation and conflict: regulating coal production. Final report.** (Regulatory Council, Washington, DC (USA)). Jan 1981. 70p. NTIS, PC A04/MF A01.

The document is a report of the Regulatory Council Coal Project, which was initiated in response to industry charges that regulatory overlap and conflict adversely affect coal production. In resolving such problems, the Council staff concluded: problems from overlapping and inconsistent regulations occur more frequently between federal and state agencies than between federal agencies; a significant portion of the overlap and inconsistency arises in enforcement; coal operators have been affected by disagreements between the Office of Surface Mining and state agencies on how to implement the new surface reclamation regulatory program; and overlapping reporting requirements and redundant permitting requirements are significant problems.

2950 Hydrogen And Synthetic Fuels

20813 **(GAO/RCED—83-27) Evaluation of administrative procedures at the Synthetic Fuels Corporation.** (General Accounting Office, Washington, DC (USA). Resources, Community and Economic Development Div.). 18 Oct 1982. 63p. General Accounting Office, P.O. Box 6015, Gaithersburg, MD 20760.

Report to The Chairman, United States Synthetic Fuels Corporation.

The Synthetic Fuels Corporation has improved its administrative procedures, but further actions are needed to strengthen contracting practices and internal financial controls. Pertinent recommendations are made in this report. This report also discusses the evolution of the Corporations's current salary structure and the activities of the Office of the Inspector General.

20814 (SERI/CP—231-1873, pp 123-134) **Photo-Kolbe reaction in biomass wastestreams.** Schwerzel, R.E.; Byker, H.J.; Vutetakis, D.G.; Wood, V.E. (Battelle, Columbus Labs., OH). Dec 1982. NTIS, PC A08/MF A01/.

From SERI biomass program principal investigators review meeting; Washington, DC, USA (23 Jun 1982).

The results presented here demonstrate that the photo-Kolbe reaction is part of a much more complex series of reactions than might be anticipated at first sight. A number of competing processes serve to lower the efficiency of hydrocarbon formation, and the search for conditions which will provide a high yield of hydrocarbons under illumination with visible light has so far proved unrewarding. The finding that short-wave ultraviolet light is required to initiate the photo-Kolbe reaction on un-derivatized semiconductor powders is particularly disappointing, as the large-scale production of hydrocarbon fuels with platinized powders would appear to be economically prohibitive. This problem might be alleviated, at least to some extent, by the use of metals other than platinum or by the use of other surface-modification techniques; the photoelectrochemical behavior of such powders is largely unexplored, however. The prospect of producing fuels for heating and transportation from renewable resources and solar energy by means of the photo-Kolbe reaction remains appealing, but at present the realization of this promise seems far from assured.

2960 Electric Power

REFER ALSO TO CITATION(S) 19699, 19710, 19715, 19931, 20248, 20249, 20250, 20251, 20252, 20253, 20254, 20268, 20285, 20286, 20288, 20289, 20761, 20789, 20791, 20794, 20803, 20855, 20856, 20857, 20858, 20897, 21889

20815 **(DOE/CS/40538—T1) Assessment of electric-utility ownership and operation of industrial-cogeneration facilities. Final report.** (Hagler, Bailly and Co., Washington, DC (USA)). Dec 1982. Contract AC02-81CS40538. 151p. NTIS, PC A08/MF A01. Order Number DE83005494.

To better understand the opportunities for direct utility involvement in the ownership and operation of industrial cogeneration facilities, the Department of Energy requested a study of the factors affecting utility ownership and operation of these facilities. The study team, with the assistance of a utility steering committee composed of representatives of 10 major investor-owned utilities, reviewed pertinent laws and regulations, held discussions with key regulatory personnel, defined prototypical ownership and operating arrangements, evaluated cogeneration facility technical characteristics and financial attractiveness, and determined specific measures designed to encourage greater utility involvement in the ownership and operation of industrial cogeneration facilities. This report discusses factors affecting utility involvement in cogeneration facilities, the positive effects of deregulation on such involvement, measures to improve the regulatory environment, and measures to improve the financial performance of utility-owned cogenerating facilities. (LCL)

20816 **(DOE/CS/40538--T2) Assessment of electric-utility ownership and operation of industrial cogeneration facilities. Final report.** (Hagler, Bailly and Co., Washington, DC (USA)). Dec 1982. Contract AC02-81CS40538. 151p. NTIS, PC A08/MF A01. Order Number DE83007985.

The study team, with the assistance of a utility steering committee composed of representatives of 10 major investor-owned utilities, reviewed pertinent laws and regulations, held discussions with key regulatory personnel, defined prototypical ownership and operating arrangements, evaluated cogeneration facility technical characteristics and financial attractiveness, and determined specific measures designed to encourage greater utility involvement in the ownership and operation of industrial cogeneration facilities. Conclusions follows: under current laws and regulations, an unregulated subsidiary of an electric utility with or without a joint venture with an industrial customer is the most attractive ownership and operating arrangement; small natural gas-fired combustion turbines/heat recovery boiler cogeneration systems offer the highest and most stable financial attractiveness to electric utilities; and variations in steam and electricity transaction rates have a greater effect on the financial attractiveness of utility investments in industrial cogeneration facilities than variations in the cost of capital and the financial structure of electric utilities.

20817 **(DOE/EIA--0191(81)) Cost and quality of fuels for electric-utility plants: 1981 annual.** (Department of Energy, Washington, DC (USA). Energy Information Administration). Sep 1982. 181p. NTIS, PC A09/MF A01. Order Number DE83006469.

This report contains information for 1981 on the cost and quality of fossil fuel receipts to all US electric utility plants with a generating capacity of 25 MW or greater. Plant-by-plant data is grouped by utility in alphabetical order. As compared with 1980, total electric power generation increased 0.4% to 2295 billion kWh. Subdivided by fuel type, coal-fueled generation was 1203 x 10^{9} kWh, up 3.5% and 52.3% of all power generation; nuclear reactors produced 273 x 10^{9} kWh, up 8.8%; and 11.4% of the total; oil produced 206 x 10^{9} kWh, down 16.3%, and 9% of the total; natural gas usage was unchanged and produced 15.1% of the total; and hydro generation at 11.4% of total was down 5.4%. Monthly, state, and regional data are tabulated. (LCL)

20818 **(DOE/EIA--0226(82/01)) Electric power monthly.** (USDOE Energy Information Administration, Washington, DC. Office of Coal, Nuclear, Electric and Alternate Fuels). Jan 1982. 159p. NTIS, PC A08/MF A01. Order Number DE83007733.

The Electric Power Monthly is designed to provide information about electric power production and consumption in a concise format to satisfy the needs of a wide variety of audiences. This publication is geared to applications by electric utilities, industry, consumers, educational institutions, and government in recognition of the growing importance of energy planning in a contemporary society. It presents monthly summaries of electric utility statistics at the national, regional, State, or local levels on the following subjects: fuel stocks; fuel receipts; fuel consumption; net generation; net energy for load; peak load and net capability; cost (fuel receipts); retail prices of electric power; and sales, revenue, and income. Each of these subjects is covered in a separate chapter. Chapters on stocks, receipts, consumption, and net generation present data first for the total US, followed by data summaries at the regional level and the State level. The chapter on sales, revenue, and income of electric utility companies presents US totals, followed by State data. Chapters on net energy for load, and peak load and net capability present US totals first, followed by regional data. The chapter on cost provides national averages followed by State averages, while the chapter on retail prices presents US averages followed by local averages. Each chapter contains related text, tables, or graphs.

20819 **(DOE/EIA--0226(82/03)) Electric Power Monthly.** (USDOE Energy Information Administration, Washington, DC. Office of Coal, Nuclear, Electric and Alternate Fuels). Mar 1982. 157p. NTIS, PC A08/MF A01. Order Number DE83008286.

The Electric Power Monthly is designed to provide information about electric power production and consumption in a concise format to satisfy the needs of a wide variety of audiences. This publication is geared to applications by electric utilities, industry, consumers, educational institutions, and government in recognition of the growing importance of energy planning in a contemporary society. It presents monthly summaries of electric utility statistics at the national, regional, state, or local levels on the following subjects: fuel stocks; fuel receipts; fuel consumption; net generation; net energy for load; peak load and net capability; cost (fuel receipts); retail prices of electric power; and sales, revenue, and income. Each of these subjects is covered in a separate chapter. Chapters on stocks, receipts, consumption, and net generation present data first for the total US, followed by data summaries at the regional level and the state level. The chapter on sales, revenue, and income of electric utility companies present US' totals, followed by regional data. The chapter on cost provides national averages followed by state averages, while the chapter on retail prices presents US' averages followed by local averages. Each chapter contains related text, tables, or graphs.

20820 **(DOE/EIA--0226(82/08)) Electric power monthly.** (USDOE Energy Information Administration, Washington, DC. Office of Coal, Nuclear, Electric and Alternate Fuels). Aug 1982. 102p. NTIS, PC A06/MF A01. Order Number DE83008005.

The Electric Power Monthly is designed to provide information about electric power production and consumption in a concise format to satisfy the need of a wide variety of audiences. This publication is geared to applications by electric utilities, industry, consumers, educational institutions, and government in recognition of the growing importance of energy planning in a contemporary society. Each chapter contains related text, tables, or graphs.

20822 **(DOE/EIA—0344) Guide for the assessment of technologies for generating electricity.** (USDOE Energy Information Administration, Washington, DC. Office of Coal, Nuclear, Electric and Alternate Fuels). Jun 1982. 632p. NTIS, PC A99/MF A01. Order Number DE83006468.

This guide provides a general understanding of electric power generation, places each technology in perspective with regard to other technologies, refers the reader to supplementary and more detailed information, and provides a framework for future updating of data bases maintained by EIA. The guide includes information on already commercialized technologies for generating electricity and technologies that have not moved beyond the prototype or demonstration state. It does not, however, include nuclear technologies or cogeneration, and does not discuss the fuel costs associated with producing electricity by each technology.

20823 **(DOE/EIA—0348(81)) Electric Power Annual.** (USDOE Energy Information Administration, Washington, DC. Office of Coal, Nuclear, Electric and Alternate Fuels). Nov 1982. 193p. NTIS, PC A09/MF A01. Order Number DE83008074.

The Electric Power Annual is designed to provide information about electric power production and consumption in a concise format to satisfy the needs of a wide variety of audiences. This publication is geared to applications by electric utilities, industry, consumers, educational institutions, and government in recognition of the growing importance of energy planning in a contemporary society. It presents annual summaries of electric utility statistics at the national, regional, state, or local levels on the following subjects: installed nameplate capacity; fuel stocks; fuel receipts; fuel consumption; net generation; net energy for load; peak load and net capability; cost (fuel receipts); retail prices of electric power; and sales, revenue, and income. Each of these subjects is covered in a separate chapter. Chapters on stocks, receipts, consumption, and net generation present data first for the total US, followed by data summaries at the regional level and the state level. The chapter on sales, revenue, and income of electric utility companies presents US' totals, followed by state data. Chapters on net energy for load, and peak load, and net capability present US' totals first, followed by regional data. The chapter on cost provides national averages followed by state averages followed by state averages, while the chapter on retail prices presents US' average followed by local averages. Each chapter contains related text, tables, or graphs.

20824 **(DOE/PE/70027—T1) Case studies in major bulk-power transactions.** (NPS Energy Management, Inc., Washington, DC (USA)). 1 Sep 1982. Contract AC01-79PE70027. 89p. NTIS, PC A05/MF A01. Order Number DE83006223.

As part of a series of studies examining various aspects of opportunities for deregulating the electric utility industry and for introducing greater competition into bulk power markets, an analysis was made of selected bulk power sales subject to some form of Federal regulation and an attempt was made to determine whether these transactions provide any useful insights into the likely outcomes of similar intersystem transactions in a deregulated environment. This report describes two major bulk power agreements among utilities in the US and two major international bulk power agreements between utility systems in the US and Canada. Questions examined in each of these agreements include the nature of sale; extent of and exercise of FERC jurisdiction; effects of state regulation; extent of required wheeling service; and degree of available competition. The study results show that while deregulation and the resulting competitive pricing might in some instances result in improved efficiency and resource allocation, there are disadvantages to be considered as well. In any event, such deregulation would reduce costs, burdens and delays associated with the regulatory process. Consequently, a number of alternatives are suggested which might lead to improvement in the process of intersystem transaction regulation and some of which might also be considered to be partial deregulation. (LCL)

20825 **(DOE/PE/70027—T3) Financing new electric-generating facilities in deregulated markets: insights from analogous industries.** (NPS Energy Management, Inc., Washington, DC (USA)). 1 Sep 1982. 177p. NTIS, PC A09/MF A01. Order Number DE83006220.

The objective of this study was to assess the terms (if any) under which medium to large scale generating projects could be financed in a deregulated (i.e., competitive) bulk power market. This working paper outlines some of the major considerations needed to address this issue based on experience in other industries and suggests an analytical framework wherein further research can be undertaken.

20826 **(DOE/PE/70106—1) Long-term consumer impacts of electricity-rate regulatory policies.** Navarro, P. (Energy and Environmental Policy Center, Cambridge, MA (USA)). Jan 1983. Contract AM01-79PE70106. 94p. NTIS, PC A05/MF A01. Order Number DE83006590.

Can rate suppressive electric utility regulation raise electricity rates higher than they otherwise would be under more fair and reasonable regulation and thereby make ratepayers worse off. This study examines that hypothesis within the context of several regulatory penalties which rate suppression imposes on the electricity consumer through its distortive effects on the utility's investment and operating decisions and through a risk premium that rate suppression appears to impose on a utility's cost of capital. The sources of rate suppression within the context of state public utility commission (PUC) regulation of the electric utility industry and the PUCs' regulatory mandate are described and analyzed. The effects of rate suppression on an electric utility's investment and operating strategy are examined within the context of the utility's twin responsibilities to ratepayers and shareholders. The three regulatory penalties associated with rate suppression, i.e., fuel penalty, cost of capital penalty, and reliability penalty are discussed. A rate-forecasting methodology to measure the regulatory penalties imposed by rate suppression is developed. A ratemaking model in wide use among the PUCs is used to forecast electricity rates and critical utility financial indicators under the two alternative regulatory regimes (rate-suppression versus capital attraction) for the two alternative investment strategies (capital minimization versus capital optimization). The results of the forecasting analysis provide conclusive evidence that the welfare of electricity ratepayers may be substantially reduced when PUCs adopt policies which prevent a utility from earning its market cost of capital, i.e., when rates are suppressed.

20827 **(DOE/RA/04934—T2) Developer handbook for Section 210 of PURPA for Montana.** Baker, C. (Franklin Pierce Law Center, Concord, NH (USA). Energy Law Inst.). 23 Feb 1982. Contract AC02-78RA04934. 79p. NTIS, PC A05/MF A01. Order Number DE83006780.

The essential element of the Public Utility Regulatory Policies Act of 1978 (PURPA) for developers is a reordering by Congress of the relationship between electric utilities and small power producers. The goal of PURPA is to encourage development of alternative sources of electricity by helping small power production become economically viable. The strategy adopted by Congress for encouraging development has two main components. First, the utility must purchase the power produced by a project meeting certain definitional requirements; and second, the utility must pay a price for the power, determined in accordance with guidelines set out in the FERC regulations. This handbook is designed to explain to developers in Montana the requirements of PURPA, including: who may qualify for treatment as a facility that may invoke the mandates of PURPA; the impact of PURPA on the state; the role of the state utility commission and the impact of state laws on the developer. Thus, the primary goal of the handbook is to provide potential small producers with a working understanding of their status and rights vis a vis the state utility commissions and electric utilities, and to aid the potential developer in obtaining the information needed to stimulate further research and development.

20828 (DOE/RA/04934—T3) Public Utility Commission manual for Section 210 PURPA for New york. (Franklin Pierce Law Center, Concord, NH (USA). Energy Law Inst.). 30 Sep 1982. Contract AC02-78RA04934. 122p. NTIS, PC A06/MF A01. Order Number DE83006702.

The Public Utility Regulatory Policies Act of 1978 (PURPA) places obligations on both electric utilities and state regulatory commissions. PURPA requires every electric utility to purchase all energy and capacity made available to it, by a qualifying facility, and to sell energy and capacity to a qualifying facility upon the qualifying facility's request. State regulatory commissions must implement and administer these utility obligations and other requirements that were implemented by the Federal Energy Regulatory Commission's (FERC) final rules, which became effective March 20, 1981; and must set fair rates for electric power purchases and sales between utilities and small power producers. This manual provides a concise, annotated explanation of the final FERC rules, a description of federal and state statutory authorizations, court challenges to these authorizations, analysis of the relationship between federal and state laws, analysis of New York's implementation of section 210 of PURPA and for comparison, annotations of selected state regulatory authority decisions.

20829 (DOE/RA/04934—T11) Developer handbook for Section 210 of PURPA for Georgia. (Franklin Pierce Law Center, Concord, NH (USA). Energy Law Inst.). 30 Sep 1982. Contract AC02-78RA04934. 65p. NTIS, PC A04/MF A01.

The essential element of the Public Utility Regulatory Policies Act of 1978 (PURPA) for developers is a reordering by Congress of the relationship between electric utilities and small power producers. The goal of PURPA is to encourage development of alternative sources of electricity by helping small power production become economically viable. The strategy adopted by Congress for encouraging development has two main components. First, the utility must purchase the power produced by a project meeting certain definitional requirements; and second, the utility must pay a price for the power, determined in accordance with guidelines set out in the FERC regulations. This handbook is designed to explain to developers in Georgia the requirements of PURPA, including: who may qualify for treatment as a facility that may invoke the mandates of PURPA; the impact of PURPA on the state; the role of the state utility commission and the impact of state laws on the developer. Thus, the primary goal of the handbook is to provide potential small producers with a working understanding of their status and rights vis a vis the state utility commissions and electric utilities, and to aid the potential developer in obtaining the information needed to stimulate further research and development.

20830 (DOE/RA/04934—T12) Developer handbook for Section 210 of PURPA for New Hampshire. Wersan, D.; O'Connell, J. (Franklin Pierce Law Center, Concord, NH (USA). Energy Law Inst.). 4 Sep 1981. Contract AC02-78RA04934. 62p. NTIS, PC A04/MF A01. Order Number DE83006776.

The essential element of the Public Utility Regulatory Policies Act of 1979 (PURPA) for developers is a reordering by Congress of the relationship between electric utilities and small power producers. The goal of PURPA is to encourage development of alternative sources of electricity by helping small power production become economically viable. The strategy adopted by Congress for encouraging development has two main components. First, the utility must purchase the power produced by a project meeting certain definitional requirements; and second, the utility must pay a price for the power, determined in accordance with guidelines set out in the FERC regulations. This handbook is designed to explain to developers in New Hampshire the requirements of PURPA, including: who may qualify for treatment as a facility that may invoke the mandates of PURPA; the impact of PURPA on the state; the role of the state utility commission and the impact of state laws on the developer. Thus, the primary goal of the handbook is to provide potential small producers with a working understanding of their status and rights vis a vis the state utility commissions and electric utilities, and to aid the potential developer in obtaining the information needed to stimulate further research and development.

20831 (DOE/RA/04934—T14) Public Utility Commission manual for Section 210 of PURPA for North Carolina. (Franklin Pierce Law Center, Concord, NH (USA). Energy Law Inst.). 30 Sep 1982. Contract AC02-78RA04934. 113p. NTIS, PC A06/MF A01. Order Number DE83006694.

The Public Utility Regulatory Policies Act of 1978 (PURPA) places obligations on both electric utilities and state regulatory commissions. PURPA requires every electric utility to purchase all energy and capacity made available to it, by a qualifying facility, and to sell energy and capacity to a qualifying facility upon the qualifying facility's request. State regulatory commissions must implement and administer these utility obligations and other requirements that were implemented by the Federal Energy Regulatory Commission's (FERC) final rules, which became effective March 20, 1981; and must set fair rates for electric power purchases and sales between utilities and small power producers. This manual provides a concise, annotated explanation of the final FERC rules, a description of federal and state statutory authorizations, court challenges to these authorizations, analysis of the relationship between federal and state laws, analysis of North Carolina's implementation of section 210 of PURPA and for comparison, annotations of selected state regulatory authority decisions.

20832 (DOE/RA/04934—T16) Public Utility Commission manual for Section 210 of PURPA for Colorado. (Franklin Pierce Law Center, Concord, NH (USA). Energy Law Inst.). 30 Sep 1982. Contract AC02-78RA04934. 109p. NTIS, PC A06/MF A01. Order Number DE83006659.

The Public Utility Regulatory Policies Act of 1978 (PURPA) places obligations on both electric utility to purchase all energy and capacity made available to it, by a qualifying facility, and to sell energy and capacity to a qualifying facility upon the qualifying facility's request. State regulatory commissions must implement and administer these utility obligations and other requirements that were implemented by the Federal Energy Regulatory Commission's (FERC) final rules, which became effective March 20, 1981; and must set fair rates for electric power purchases and sales between utilities and small power producers. This manual provides a concise, annotated explanation of the final FERC rules, a description of federal and state statutory authorizations, court challenges to these authorizations, analysis of the relationship between federal and state laws, analysis of Colorado's implementation of section 210 of PURPA and for comparison, annotations of selected state regulatory authority decisions.

20833 (DOE/RA/04934—T26) Developer handbook for Section 210 of PURPA for Maine. O'Connell, J. (Franklin Pierce Law Center, Concord, NH (USA). Energy Law Inst.). 4 Sep 1981. Contract AC02-78RA04934. 62p. NTIS, PC A04/MF A01. Order Number DE83006781.

The essential element of the Public Utility Regulatory Policies Act of 1978 (PURPA) for developers is a reordering by Congress of the relationship between electric utilities and small power producers. The goal of PURPA is to encourage development of alternative sources of electricity by helping small power production become economically viable. The strategy adopted by Congress for encouraging development has two main components. First, the utility must purchase the power produced by a project meeting certain definitional requirements; and second, the utility must pay a price for the power, determined in accordance with guidelines set out in the FERC regulations. This handbook is designed to explain to developers in Maine the requirements of PURPA, including: who may qualify for treatment as a facility that may invoke the mandates of PURPA; the impact of PURPA on the state; the role of the state utility commission and the impact of state laws on the developer. Thus, the primary goal of the handbook is to provide potential small producers with a working understanding of their status and rights vis a vis the state utility commissions and electric utilities, and to aid the potential developer in obtaining the information needed to stimulate further research and development.

20834 **(DOE/RA/04934—T30) Public Utility Commission manual for Section 210 of PURPA for Montana.** (Franklin Pierce Law Center, Concord, NH (USA). Energy Law Inst.). 30 Sep 1982. Contract AC02-78RA04934. 121p. NTIS, PC A06/MF A01. Order Number DE83006705.

The Public Utility Regulatory Policies Act of 1978 (PURPA) places obligations on both electric utilities and state regulatory commissions. PURPA requires every electric utility to purchase all energy and capacity made available to it, by a qualifying facility, and to sell energy and capacity to a qualifying facility upon the qualifying facility's request. State regulatory commissions must implement and administer these utility obligations and other requirements that were implemented by the Federal Energy Regulatory Commission's (FERC) final rules, which became effective March 20, 1981; and must set fair rates for electric power purchases and sales between utilities and small power producers. 20835 **(DOE/RA/50236—1) NCSL Small-Scale Hydro Project. Final report, September 1978-January 1983.** (National Conference of State Legislatures, Denver, CO (USA)). 1983. Contract FG03-80RA50236. 37p. NTIS, PC A03/MF A01. Order Number DE83007416.

The principal objective of the National Conference of State Legislatures' (NCSL) Small Scale Hydro Project was to stimulate small-scale hydropower. The project had the following work tasks: to initiate state small-scale hydro policy reviews; provide technical assistance to state small-scale hydro policy reviews; serve as liaison with small-scale hydro community; and perform project evaluation by preparing technical status reports. The activities performed in this project and the technical assistance provided to specified states are enumerated. (LCL)

20836 **(DOE/RG/06380—T1) Electric-utility financial database documentation.** (Temple, Barker and Sloane, Inc., Lexington, MA (USA)). Jul 1979. Contract AC01-78RG06380. 41p. NTIS, PC A03/MF A01. Order Number DE83006021.

This report is intended to describe and document a computerized national electric utility database which contains data for each of the 212 privately owned Class A and B electric utilities which existed at the end of 1976. The database contains both historical and projected financial operating data items which are intended to provide DOE with a sufficient base to make company-specific financial projections for a ten-year period. This report defines and describes each of the data items in the database, and documents the procedures used to derive each item so that the database can be maintained in the future. Data items include: operations and maintenance expenses; exogenous variables; financial parameters; existing electrical plant; initial financial items; and capital budget.

20837 **(EPRI-CS—2860) Continuous-emission monitoring in the electric-utility industry. Final report.** (Kilkelly Environmental Associates, Inc., Raleigh, NC (USA)). Feb 1983. 114p. NTIS, PC A06/MF A01. Order Number DE83901457.

Many electric utility companies are experiencing difficulty and incurring significant costs in attempting to comply with federal and state continuous emission monitoring (CEM) regulations. Electric utility users have found that CEM systems are expensive to operate, require extensive maintenance, are not reliable, and are subject to numerous application-specific problems. In addition, CEM regulations are complex, difficult to interpret, and constantly changing. These difficulties not withstanding, most electric utility companies are either now required or will soon be required to install and operate CEM systems. Therefore, information that may assist prospective users in establishing successful CEM programs was compiled from the results of two utility surveys, a CEM user's workshop, and several site evaluations of CEM installations. From this information, it was determined that the major elements of an effective CEM program include: (1) corporate commitment, (2) thorough understanding of CEM regulations, (3) recognition of the limitations of CEM technology, (4) adequate consideration of application-specific influences, (5) comprehensive maintenance and quality assurance, (6) adequately trained, dedicated personnel, and (7) working rapport with the regulating agency. Incorporation of these elements during the development stage will help minimize the cost and burden of implementing many CEM programs.

20838 **(EPRI-EA—2832) Energy use and customer welfare effects of residential time-of-use rates. Final report.** Parks, R.W. (Parks (Richard W.), Seattle, WA (USA)). Jan 1983. 50p. NTIS, PC A03/MF A01. Order Number DE83901459.

The first part of this study presents an econometric analysis of the consumer response to time-of-use pricing of electricity using data from the Wisconsin Residential Time-Of-Use Electricity Pricing Experiment for July of 1977. We employ a neoclassical consumer choice framework that assumes a two-stage consumer budgeting process. This framework, used also by Caves and Christensen and others in analyzing electricity demand, places emphasis on the estimation of substitution parameters in the context of conditional demand functions. We provide estimates of the elasticities of substitution which indicate how consumers adjust their consumption at various times in response to changes in the relative prices of electricity at these times. We distinguish a peak, off-peak, and two shoulder periods in our analysis. The results confirm for this multiperiod analysis the results of studies that examine only peak versus off-peak use in finding small but statistically significant substitution responses by consumers. The second part of the study considers measures of the welfare consequences for consumers of a shift to time differentiated rates. We show how the special structure of the choice model can be used to permit a simple calculation of a compensating variation measure of the welfare effects, and we present estimates of the measure for the various experimental groups based on the econometric results together with other evidence.

20839 **(EPRI-NP—2875) Information system for generation availability: executive summary. Final report.** Keller, R.W. (TERA Corp., Englewood, CO (USA)). Feb 1983. 23p. NTIS, PC A02/MF A01. Order Number DE83901444.

This report presents a summary of EPRI-sponsored research into the requirements, applications, and design of an Information System for Generation Availability (ISGA). A review of the program's accomplishments is provided, and a guide is included to the available material, the majority of which is in a form that enables direct adaptation and application by individual utilities. EPRI funding and industry support for the ISGA, initiated in 1976, were terminated in 1982.

20840 **(GAO/EMD—82-102) Clear federal-policy guidelines needed for future Canadian-power imports.** (General Accounting Office, Washington, DC (USA). Office of the Comptroller General). 20 Sep 1982. 81p. General Accounting Office, P.O. Box 6015, Gaithersburg, MD 20760.

Report to The Congress.

United States imports of Canadian electricity have been rapidly increasing for the last 10 years and are expected to continue for the next decade. Canadian utilities will have excess capacity equivalent to the output of 10 to 20 large nuclear powerplants available for export through 1996. The Department of Energy exercises control over imports of Canadian electricity by issuing permits for the construction of electrical transmission facilities at international borders. To date such permit applications have been appraised on a case-by-case basis. But anticipated increases in Canadian imports clearly signify the need for clear policy guidelines on the role of Canadian power to guide DOE's permit approval program and as part of its overall electricity planning efforts. GAO recommends that the Secretary of Energy work with the executive subcabinet working group on Regulation, Completition, and Efficiency in the Electric Utility Industry to establish clear Federal policy guidelines towards Canadian power imports

20841 (GAO/EMD—82-125) **Federal Government is still not adequately prepared to respond to major electrical emergencies.** (General Accounting Office, Washington, DC (USA). Energy and Minerals Div.). 13 Sep 1982. 23p. General Accounting Office, P.O. Box 6015, Gaithersburg, MD 20760.

Report to The Chairman, House Subcommittee on Energy, Environment, and Safety Issues Affecting Small Business.

In a previous review GAO found Federal electrical-emergency-preparedness programs and plans to be deficient. After a year, very little substantive progress has been made at preparing the United States to respond to a national or regional disruption. While the Department of Energy and the Federal Emergency Management Agency have taken a few positive steps, Federal electrical-emergency-preparedness programs and plans have not been developed. Without a strong Federal role in electrical emergency preparedness, it may be difficult to manage and restore electrical power if a major disruption occurred because States will not be able to deal with such an incident in an effective and timely manner. To be prepared, GAO believes the Department of Energy and the Federal Emergency Management Agency should implement its previous recommendations.

20842 (ITA—82-08-503) **Survey of the Italian market on electric power systems and energy conservation equipment. Foreign market survey report.** (J.B.A., Milan (Italy)). Jan 1982. 67p. NTIS PC $15.00/MF A01.

The market research was undertaken to study the present and potential US share of the market in Italy for electric power systems and energy conservation equipment; to examine growth trends in Italy end-user industries over the next few years; to identify specific product categories that offer the most promising export potential for US companies; and to provide basic data which will assist US suppliers in determining current and potential sales and marketing opportunities. The trade promotional and marketing techniques which are likely to succeed in Italian were also reviewed.

20843 (ITA—82-08-507) **A brief market study on electric power systems and energy conservation equipment in Thailand. Foreign market survey report (final).** (Applied Research Corp., Singapore). Mar 1982. 72p. NTIS PC $15.00/MF A01.

The market research was undertaken to study the present and potential US share of the market in Thailand for electric power systems and energy conservation equipment; to examine growth trends in Thai end-user industries over the next few years; to identify specific product categories that offer the most promising export potential for US companies; and to provide basic data which will assist US suppliers in determining current and potential sales and marketing opportunities. The trade promotional and marketing techniques which are likely to succeed in Thailand were also reviewed.

20844 (ITA—82-08-516) **The market for power generation equipment in Turkey (1982-1986). Foreign market survey report.** Gur, E.Y. (American Embassy, Ankara (Turkey)). Mar 1982. 49p. NTIS PC $15.00/MF A01.

The market research was undertaken to study the present and potential US share of the market in Turkey for power generation equipment; to examine growth trends in Turkish end-user industries over the next few years; to identify specific product categories that offer the most promising export potential for US companies; and to provide basic data which will assist US suppliers in determining current and potential sales and marketing opportunities. The trade promotional and marketing techniques which are likely to succeed in Turkey were also reviewed.

20845 (NP—3900143) **Energy supplies and energy conservation. Pt.2.** (Badenwerk A.G., Karlsruhe (Germany, F.R.)). 1982. 53p. (In German). NTIS (US Sales Only), PC A04/MF A01. Order Number DE83900143.

A description of the structure and the activities of this power utility company is given which had also served as an information basis for the general meeting held on the 25th of June 1982. Furthermore, explanations on the annual accounting of 1981 are given and the report of the supervisory board is presented. The annual balance as well as the profit and loss account are given in the appendix.

20846 (NP—3901023) **Electric power supply in the Federal Republic of Germany - August 1981.** (Bundesministerium fuer Wirtschaft, Bonn (Germany, F.R.)). 1981. 3p. (In German). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83901023.

Tables and diagrams are presented for the month under report with figures on electric power generation (water, heat), exchange with other countries and the GDR, industrial power generation, power consumption, power generation on the third Wednesday of the month, consumption and stock of coal in utility-owned power plants and development of power consumption from the public supply network.

20847 (NP—3901024) **Electric power supply in the Federal Republic of Germany - February 1982.** (Bundesministerium fuer Wirtschaft, Bonn (Germany, F.R.)). 1982. 4p. (In German). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83901024.

Tables and diagrams are presented for the month under report with figures on electric power generation (water, heat), exchange with other countries and the GDR, industrial power generation, power consumption, power generation on the third Wednesday of the month, consumption and stock of coal in utility-owned power plants and development of power consumption from the public supply network.

20848 (NP—3901025) **Electric power supply in the Federal Republic of Germany in the year 1981.** (Bundesministerium fuer Wirtschaft, Bonn (Germany, F.R.)). 1981. 4p. (In German). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83901025.

Tables and diagrams are presented for the year under report with figures on electric power generation (water, heat), exchange with other countries and the GDR, industrial power generation, power consumption, power generation on the 3rd Wednesday in December, consumption and stocks of coal in utility-owned power plants and the development of power consumption from public supply network.

20849 (NP—3901666) **Reserve-reliability analysis study module V. Final report.** (ICF, Inc., Washington, DC (USA)). Aug 1982. 63p. NTIS, PC A04/MF A01. Order Number DE83901666.

Customer costs of electrical energy shortfalls (i.e., customer outage costs) by major customer class categories, as a function of increasing levels of curtailments were estimated for residential, commercial and industrial sectors. The total regional outage cost as a function of increasing levels of curtailments, and under alternate curtailment strategies was forecasted. A strategic planning model was developed to analyze issues related to strategic resource planning: identification of least cost investment strategies under uncertain load growth which rely on the economically optimal level of demand-side and renewable resource options in addition to traditional supply-side options; reserve-reliability tradeoff (i.e., the optimal level of power supply reliability); and impact of a less conservative planning philosophy vis-a-vis the assumption of critical water planning.

20850 (NP—3901667) **User's manual for the bill comparison and usage modification programs. Rate-design analysis study module IV. Technical appendix to final report.** (ICF, Inc., Washington, DC (USA)). Aug 1982. 50p. NTIS, PC A03/MF A01. Order Number DE83901667.

This manual describes the use and applications of two FORTRAN programs. This bill comparison program calculates electric bills for specified consumption levels under two sets of rates and then compares them on monthly, seasonal and annual bases. The usage modification program uses price elasticities to estimate the effects on consumption of a new set of rates. After the new consumption levels are calculated, electricity bills under the new rates are calculated on both a monthly and annual basis. The manual is organized in three sections. Section II describes the output tables which are produced along with a listing of the input files needed to run the programs. Section III provides a detailed line-by-line discussion of the entries for the input files. Three appendices are used to provide listings of the programs, including the program used to generate the transfer tape.

20851 (NP—3901668) **Rate design analysis study module IV. Final report, Phase II.** (ICF, Inc., Washington, DC (USA)). Aug 1982. 98p. NTIS, PC A05/MF A01. Order Number DE83901668.

Rate design alternatives were reviewed to encourage cost-effective conservation and renewable resources within the Pacific Northwest region. An analytic framework was developed for evaluating the rate design alternatives. Recommendations are given concerning relevant rate designs and their impacts. Policy options are suggested for implementing the findings.

20852 (ORNL/TM—8510) **Age and capacity profile of electric-generation plants in the United States.** Hudson, C.R. II. (Oak Ridge National Lab., TN (USA)). Mar 1983. Contract W-7405-ENG-26. 40p. NTIS, PC A03/MF A01. Order Number DE83008169.

There are currently over 9000 power plants in the United States of varying types and ages. This study categorizes these plants by age, fuel type, and region. In addition, capacity trends through time and potential replacement-capacity needs are addressed.

20853 (P—110-82-003) **Delivering energy services: new challenges for California's electric utilities.** Praul, C.G.; Marcus, W.B.; Dawson, M.H. (California Energy Resources Conservation and Development Commission, Sacramento (USA)). Mar 1982. 364p. California Energy Commission, 1516 Ninth Street, Sacramento, CA.

The purpose of this paper is to explore the financial circumstance and energ service corporation opportunities of California's investor-owned and municipal electric or electric/gas utilities. Background information is provided on the national utility context and the current financial status of the state's major investor-owned electric, electric/gas utilities. Two utility finance/electricity supply strategies for the 1980s are reviewed California and national programs requiring increased utility energy service capabilities are discussed. Concerns and recommendations regarding utility transformation toward broader energy service roles are presented.

20854 **Sample design considerations and sample selection for the Vermont time-of-day electricity use survey.** Hausman, J.A. (Massachusetts Inst. of Tech.); Trimble, J.L. pp 83-96 of Review of public data use 9. New York, NY; Elsevier North Holland (1981).

This article presents a sample selection procedure that separates two potentially serious forms of sample bias. It also reviews the sample selection procedure in a mail survey of residential electricity users in the state of Vermont. The survey was designed to provide evidence, for policy purposes, of the potential long-range effects of a new rate structure for residential users - the time-of-day (TOD) rate, for which changes depend on what period of day electricity is consumed. Adjustments to TOD rates are of national policy interest. Vermont is one of but a few areas for which real evidence of the long-term effect of TOD rates is available. The design strategy for examining long-range effects is to allow for the comparison of electricity-using durable good purchases and energy-saving capital expenditures between two groups of residential customers - one under the TOD rate and the other not.

2980 Consumption And Utilization

REFER ALSO TO CITATION(S) 19647, 19648, 19649, 19699, 20761, 20776, 20789, 20809, 20945, 20947

20855 (DOE/EIA—0035(82/05)) **Monthly Energy Review.** (Department of Energy, Washington, DC (USA). Energy Information Administration). May 1982. 105p. NTIS, PC A06/MF A01. Order Number DE83008093.

Current data and trends are presented for production, consumption, stocks, imports, exports, and prices for the principal energy commodities in the United States. Also included are data on internaional production of crude oil, consumption of petroleum products, petroleum stocks, and production of electricity from nuclear powered facilities. Energy production during the first 2 months of 1982 totaled 10.7 quadrillion Btu, virtually unchanged from the level of production during the same period of 1981. Energy consumption during the first 2 months of 1982 totaled 13.5 quadrillion Btu, a 1.6% decrease compared to consumption during the same period of 1981. Net imports of energy during the first 2 months of 1982 totaled 1.2 quadrillion Btu, 38.0% below the level of the first 2 months of 1981.

20856 (DOE/EIA—0035(82/06)) **Monthly Energy Review.** (Department of Energy, Washington, DC (USA). Energy Information Administration). Jun 1982. 103p. NTIS, PC A06/MF A01. Order Number DE83007964.

Current data and trends are presented for production, consumption, stocks, imports, exports, and prices for the principal energy commodities in the United States. Also included are data on international production of crude oil, consumption of petroleum products, petroleum stocks, and production of electricity from nuclear powered facilities. Energy production during the first 3 months of 1982 totaled 16.7 quadrillion Btu, a 1.5% increase compared to the level of production during the same period of 1981. Energy consumption during the first 3 months of 1982 totaled 19.9 quadrillion Btu, a 0.9% decrease compared to consumption during the same period of 1981. Net imports of energy during the first 3 months of 1982 totaled 1.7 quadrillion Btu, 39.3% below the level of the first 3 months of 1981.

20857 (DOE/EIA—0035(82/07)) **Monthly energy review.** (Department of Energy, Washington, DC (USA). Energy Information Administration). Jul 1982. 105p. NTIS, PC A06/MF A01. Order Number DE83008091.

Current data and trends are presented for production, consumption, stocks, imports, exports, and prices for the principal energy commodities in the United States. Also included are data on international production of crude oil, consumption of petroleum products, petroleum stocks, and production of electricity from nuclear powered facilities. Energy production during the first 4 months of 1982 totaled 22.2 quadrillion Btu, a 5.0-percent increase compared to the level of production during the same period of 1981. Natural gas production decreased by 2.4 percent. Increases in production occurred for petroleum and coal. Petroleum production was up by 0.2 percent and coal production was up by 15.9 percent. All other forms of energy production combined were up by 15.5 percent. Energy consumption during the first 4 months of 1982 totaled 25.8 quadrillion Btu, a 0.3-percent decrease compared to the level of consumption during the same period of 1981. Net imports of energy during the first 4 months of 1982 totaled 2.1 quadrillion Btu, 40.7 percent below the level of the first 4 months of 1981.

20858 (DOE/EIA—0035(82/09)) **Monthly energy review. First half 1982 summary.** (Department of Energy, Washington, DC (USA). Energy Information Administration). Sep 1982. 108p. NTIS, PC A06/MF A01. Order Number DE83008090.

The report presents current data and trends for production, consumption, stocks, imports, exports, and prices for the principal energy commodities in the United States. Also included are data on international production of crude oil, consumption of petroleum products, petroleum stocks, and production of electricity from nuclear powered facilities. This issue contains energy summary data for the first 6 months of 1982. Electricity sales during this period declined 1.1 percent from the level for the first half of 1981. Because domestic energy consumption was lower and energy production was higher than during the first half of 1981, lower levels of energy imports were sufficient to meet the Nation's energy requirements. Refiner acquisition costs of crude oil and prices of petroleum products were lower than in the first 6 months of the previous year. Supplies of natural gas and coal were larger at the end of June 1982 than at the end of June a year earlier.

20859 **(DOE/EIA—0035(82/11)) Monthly energy review.** (USDOE Energy Information Administration, Washington, DC. Office of Energy Markets and End Use). Nov 1982. 104p. NTIS, PC A06/MF A01. Order Number DE83008012.

Current data are presented for production, consumption, stocks, imports, exports, and prices for the principal energy commodities in the United States. Also included are data on international production of crude oil, consumption of petroleum products, petroleum stocks, and production of electricity from nuclear powered facilities. Energy production during the first 8 months of 1982 totaled 43.4 quadrillion Btu, a 2.1 percent increase compared to the level of production during the same period of 1981. Energy consumption during the first 8 months of 1982 totaled 48.0 quadrillion Btu, a 3.2-percent decrease compared to consumption during the same period of 1981. Net imports of energy during the first 8 months of 1982 totaled 4.7 quadrillion Btu, 30.1 percent below the level of the first 8 months of 1981.

20860 **(DOE/EIA—0321/1) Residential energy consumption survey: consumption and expenditures, April 1980-March 1981. Part 1. National data.** (USDOE Energy Information Administration, Washington, DC. Office of Energy Markets and End Use). Sep 1982. 248p. NTIS, PC A11/MF A01. Order Number DE83008001.

This report covers consumption for the period April 1980 through March 1981. It contains detailed tabulations of total consumption and expenditures and of consumption and expenditures per household for all fuels and for specific fuels. These data are given by significant energy-related characteristics of the household. Energy use by the measured area of the house is also included. This report also contains results of an effort to measure consumption of wood fuels.

20861 **(DOE/EIA—0358) Report on the 1980 manufacturing industries energy consumption study and survey of large combustors.** (USDOE Energy Information Administration, Washington, DC. Office of Energy Markets and End Use). Jan 1983. 60p. NTIS, PC A04/MF A01. Order Number DE83008811.

An overview of data collected from a 1980 Manufacturing Industries Energy Consumption Study and Survey of Large Combustors was designed to collect information on large combustors in the United States and the manufacturing establishments operating them. The survey was mailed to a list of respondents in late November and early December 1980. Although responses were received from approximately 76%, the usefulness of the survey was substantially diminished for the following reasons: the results of this survey are probably somewhat biased due to systematic nonresponse error; and because of the withdrawal of authority for this survey, the EIA was unable to undertake a followup of respondents to resolve problems of missing and seemingly questionable data.

20862 **(NP—3900027) Energy supplies and energy conservation. Pt. 2.** Gruenhagen, J. (Deutsche Presse-Agentur G.m.b.H., Hamburg (Germany, F.R.)). 17 Feb 1981. 17p. (In German). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83900027.

This second part of the documentation gives a short survey of the utilization of conventional energy carriers and of alternative energy conversion methods (cogeneration, heat pumps, solar energy, bioenergy, wind and water power).

2990 Unconventional Sources And Power Generation

REFER ALSO TO CITATION(S) 19931, 19965, 19965, 19976, 19983, 19984, 19985, 19987, 20013, 20015, 20016, 20021, 20036, 20038, 20074, 20075, 20077, 20164, 20191, 20205, 20208, 20862, 20895, 20900, 20999, 21002

20863 **(DOE/EIA—0360(80)) 1980 Active-Solar Installations Survey.** (Applied Management Sciences, Inc., Silver Spring, MD (USA)). Oct 1982. Contract AC01-80EI10231. 57p. NTIS, PC A04/MF A01. Order Number DE83008026.

The survey covers active solar installations made during and prior to calendar year 1980. As the first survey of active solar installations in the United States, the objective was to establish a national baseline information system that could provide current data on residential and commercial active solar installations as well as a listing of firms involved in the active solar industry, including installers. Potential respondents were identified from regional lists of solar equipment dealers and installers compiled by each Regional Solar Energy Center (RSEC). The RSEC lists were computerized and combined into a mailing list of 5466 company names and addresses. An additional 1619 referrals, were provided by survey respondents from the RSEC list. However, because of resource constraints, 981 of these referrals were not included in the survey. To substantiate that the results of this survey represent accurate statistics on the number of active solar installations in the United States, a comparison was made to the Solar Collector Manufacturing Survey installations. (PSB)

20864 **(EUR—7597-EN/Vol.1) Present state of technology of recovery and conversion process for synthetic fuels.** Caemmerer, D.; Niclauss, M.; Schinke, H. (Commission of the European Communities, Luxembourg). 1982. 20p. Available from the Commission of the European Communities, Luxembourg.

The production of synthetic fuels, as alternative to the use of crude oil, is technologically possible by different ways and means. Since the 1920's the greatest attention has been paid to the raw materials with a fossil base such as hard coal, lignite, shale oil and tar sands. For the extraction and conversion of such deposits large-scale plants with relatively low investment and running costs are needed. It is necessary to widen the range of energy bases as the conventional primary energy bases such as crude oil, natural gas and coal are growing scarce, more expensive, and might become unavailable for political reasons. One alternative is the use of solar energy, either from solar collectors and photocells or indirectly from biomass. Therefore the production of synthetic fuels from biomass is considered with particular care in the presented study. The analysis introduces the various sources of synthetic fuels and deals with all important aspects related to the recovery and conversion processes for synthetic fuels, like technology, apparatus and pollution, economy and market structure and also certain political developments which might become decisive. Finally some recommendations are made for directions of future advanced developments. These recommendations cover however technological points of view only.

20865 **(LBL—14782-Rev.) Methods for evaluating the DOE Appropriate-Technology Program: A review and compilation of evaluation methods.** Lucarelli, B. (Lawrence Berkeley Lab., CA (USA)). Jul 1982. Contract AC03-76SF00098. 92p. NTIS, PC A05/MF A01. Order Number DE83007165.

Procedures are described for evaluating the energy impact of renewable energy resource projects. Four recommendations are made: to establish a common set of guidelines for evaluating the energy impact of federal energy grant programs; use a simplified evaluation approach in the interim until the guidelines are set; develop additional project evaluation methods; and analyze the non-energy impacts of the Appropriate Technology Program. Previously used evaluation approaches are discussed as regards energy impact definition, sample selection, project evaluation, and program impact analysis. Methods are described for determining direct energy impacts of: wind electric, hydroelectric, anaerobic digestion (biomass); solar water heating and space heating; passive solar; weatherization/conservation; and geothermal space and water heating technologies. The methodology for estimating the cost-effectiveness of an energy system is presented. Tables of load collector ratios and solar savings fraction for different passive systems are supplied.

30 DIRECT ENERGY CONVERSION

3001 Mhd Generators

REFER ALSO TO CITATION(S) 22764

20866 (CONF-800151—2) Three-dimensional analysis of MHD generators: development of electrical solution. Ahluwalia, R.K.; Vanka, S.P.; Im, K.H.; Zwick, S.A. (Argonne National Lab., IL (USA)). 1980. Contract W-31-109-ENG-38. 11p. NTIS, PC A02/MF A01. Order Number DE83007599.

From Aerospace sciences meeting; St Louis, MO, USA (12 Jan 1980).

A model for calculating three-dimensional current and electric-field distributions in MHD generator channels is formulated and numerically solved. The chief advantage of this model is that its solution can be implemented on the digital computer in less than one CPU second and thus the model can be conveniently coupled to a full three-dimensional gas-dynamic analysis. The model is equally valid for Faraday, diagonal insulating-side-wall, and diagonal conducting-sidewall channels. Accuracy of the model is calibrated by compring its predictions with the results of three-dimensional finite segmentation analyses. The model is found to perform best for channels with low wall temperatures and low electrode pitch-to-height ratios, and when the boundary layers are thick. A discussion is given of the roles of the nonuniformity in normal current density, as predicted by the model, leading to velocity overshoots in the boundary layers, and of the transverse nonuniformity in Hall current density, generating secondary flows.

20867 (CONF-810614—7) Radiative transfer in spectrally-dissimilar absorbing-emitting-scattering adjacent mediums. Im, K.H.; Ahluwalia, R.K. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 10p. NTIS, PC A02/MF A01. Order Number DE83007650.

From 16. thermophysics conference; Palo Alto, CA, USA (23 Jun 1981).

Structure of radiation field in a cylindrical medium having two regions of different, but uniform absorption and scattering coefficients is analyzed. Fundamental aspects of the problem are elucidated by considering the case of a gray medium. It is shown for example that for unequal absorption coefficients in the two regions, both emission and absorption rates are discontinuous at the interface of the two regions, but the heat flux and incident radiation are continuous. As an application of the analysis, the influence on heat transfer of spatial distribution of particles in a coal-burning swirl combustor is investigated. In the example application, spectral calculations are performed spanning over the broad frequency range of the thermal radiation spectrum.

20868 (CONF-810639—6) Secondary-flow effects in diagonal MHD channels. Ahluwalia, R.K.; Vanka, S.P. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 10p. NTIS, PC A02/MF A01. Order Number DE83007934.

From 19. symposium on the engineering aspects of magnetohydrodynamics; Tullahoma, TN, USA (15 Jun 1981).

Detailed three-dimensional calculations are made to study the generation of secondary flows in conducting and insulating-sidewall diagonal channels. The secondary flows are found to have considerable influence on the velocity overshoots, momentum and thermal mixing, flow asymmetry, and the power output. They tend to diminish the velocity overshoots, to promote mixing, and to introduce flow asymmetry. The gross predictions of the three-dimensional model are compared with the experimental data taken at the University of Tennessee Space Research Institute and found to be in good agreement.

20869 (CONF-810664—3) Coupled three-dimensional flow and electrical calculations for Faraday MHD generators. Vanka, S.P.; Ahluwalia, R.K. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 11p. NTIS, PC A02/MF A01 . Order Number DE83007656.

From 5. AIAA computational fluid dynamics conference; Palo Alto, CA, USA (22 Jun 1981).

A three-dimensional model incorporating fully the interaction between the flow and electrical fields in MHD channels is presented. The model consists of Navier-Stokes equations in parabolic form, Maxwell and Ohm's equations as they apply to the MHD situation, and a two-equation turbulence model. The model predictions are first compared against the supersonic flow experimental data from the AEDC facility; these data reflect weak MHD interaction in that the flow field is little affected by the electrical-power extraction. The model is then applied to high-interaction subsonic flow in the AEDC channel to show the emergence of velocity overshoots, secondary flow, and the asymmetries in flow and electrical fields.

20870 (CONF-810812—47) Retrofit of a coal-fired open-cycle liquid-metal MHD to steam power plants. Pierson, E.S.; Herman, H.; Petrick, M.; Grammel, S.J.; Dubey, G. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 7p. NTIS, PC A02/MF A01. Order Number DE83007874.

From IECEC conference; Atlanta, GA, USA (9 Aug 1981).

The application of the new, coal-fired open-cycle liquid-metal MHD (OC-LMMHD) energy-conversion system to the retrofit of an existing, oil- or gas-fired conventional steam power plant is evaluated. The criteria used to evaluate the retrofit are the net plant efficiency and the cost benefit relative to other options, i.e., continuing to burn oil, a conventional retrofit to burn coal (if possible), and an over-the-fence gasifier for boilers that cannot burn coal directly. The efficiency and cost calculations are based on a specific existing steam plant, and a detailed description of the retrofit plant. The unique capability of the OC-LMMHD cycle to control the pollutants normally associated with burning coal is discussed.

20871 (CONF-820645—5) Nucleation of slag and seed in MHD plants. Im, K.H.; Ahluwalia, R.K. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 9p. NTIS, PC A02/MF A01. Order Number DE83007622.

From 20. symposium on engineering aspects of magnetohydrodynamics; Los Angeles, CA, USA (14 Jun 1982).

Evolution of slag and K_2SO_4 particles from the parent vapors in the MHD plant is analyzed by considering the processes of homogeneous nucleation, heterogeneous nucleation and agglomeration of particles in conjunction with gas phase equilibrium chemistry. The nucleation characteristics of the two species are found to be different primarily because of the heavier molecular weight and lower condensation temperature of K_2SO_4. Calculations indicate that in the presence of nucleated slag particles, K_2SO_4 is more likely to condense on the slag particles than to self-nucleate even at moderate slag loadings and rapid quenching of gas. In the downstream components where the gas residence time is comparatively long, agglomeration is seen to cause significant narrowing of the slag particle size spectrum by coagulating the small particles with the larger ones, to reduce the number density of slag particles by an order of magnitude, and to increase the average size of the particles. In the absence of slag particles, the predicted K_2SO_4 particle size spectrum is sensitive to the reduction in surface tension due to droplet curvature.

20872 (CONF-820645—6) Flow-field development in MHD diffusers. Vanka, S.P.; Ahluwalia, R.K. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 10p. NTIS, PC A02/MF A01. Order Number DE83007597.

From 20. symposium on engineering aspects of magnetohydrodynamics; Los Angeles, CA, USA (14 Jun 1982).

The development of the flow field in diffusers for the MHD power generation system is analyzed. The equations governing the flow processes are solved by a numberical procedure in which the inlet conditions are appropriate to the exit conditions of an MHD channel. The development of velocity distortions and secondary flows are investigated for a number of diffuser angles with either side-wall or electrode-wall divergence. For all the cases considered, it is found that the flow separation always occurs at the corner regions of the top wall. The influences of secondary flows and turbulent viscosity are demonstrated.

20873 (CONF-820645—7) Aerosol and vapor deposition of slag and seed in MHD components. Ahluwalia, R.K.; Im, K.H. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 13p. NTIS, PC A02/MF A01. Order Number DE83007619.

From 20. symposium on engineering aspects of magnetohydrodynamics; Los Angeles, CA, USA (14 Jun 1982).

Consistent models are formulated for determining the deposition of slag and seed particles in the components of the MHD plant by the mechanism of thermophoresis, Brownian diffusion, turbulence and inertial impingement. The predictions from the deposition models are compared favorably with the experimental data. The formulated models are found to be significant improvements of the existing deposition theories. A fouling theory is developed that can be used for interpreting, correlating and extrapolating the experimental data. The premise of the fouling theory is confirmed through comparison with the experimental data. The deposition model is incorporated into the population balance equation containing other terms to account for homogeneous nucleation, direct condensation and agglomeration of particles. The complete model is used to study the condensation and deposition of slag and seed in the downstream components of the MHD plant.

20874 (CONF-8111106—1) Integration of open-cycle MHD with various chemical and metallurgical processes. Jones, M.S. Jr. (Ebasco Services, Inc., Newport Beach, CA (USA)). 1981. 22p. Ebasco Services, Inc., Newport Beach, CA.

From Specialists meeting on coal fired MHD power generation; Sydney, Australia (4 Nov 1981).

The use of open-cycle MHD in a cogeneration mode is examined for the electrochemical and metallurgical industries. The MHD cycle has the potential for supplying electricity, steam, and high-temperature air or high-temperature combustion products to meet process requirements. The potential energy savings which may be realized through the use of open-cycle MHD in a cogeneration mode are estimated through the use of a first-order thermodynamic MHD plant model which estimates the amount of fuel required for unit of product as the performance of various plant components are changed. Inputs to the model are the process requirements for electricity, steam, and high-temperature heat. The primary method of analysis is to assume the process requirements for the various industries and to examine how the amount of fuel required varies as the MHD generator enthalpy extraction efficiency is varied. Processes using open-cycle MHD for producing aluminum and chlorine-caustic soda are examined in some detail. Processes for the production of iron or steel, and for the production of hydrogen for ammonia are also examined. The use of open-cycle MHD to produce hydrogen for the manufacture of ammonia is also examined. The use of the high-temperature waste heat in the MHD-channel exhaust for thermochemical hydrogen production in a hybrid cycle is an attractive option. The sizes of possible open-cycle MHD installations for these industries are examined and the conditions that the processes impose on the MHD system are discussed. The suitability of the disc MHD generator for these applications is then examined.

20875 (DOE/ET/15611—T7) Effects of core nonuniformities on the performance of MHD generators. HTGL report No. 234. Wynn, M.C. (Stanford Univ., CA (USA). High Temperature Gasdynamics Lab.). Sep 1982. Contract AC01-80ET15611. 240p. NTIS, PC A11/MF A01. Order Number DE83007901.

The effects on MHD-generator performance of nonuniform temperature and electrical-conductivity distributions in the core of a combustion plasma were investigated. Experiments were performed in which the plasma temperature field in a laboratory-scale MHD channel was perturbed by injection of room-temperature nitrogen. Agreement o the data was obtained with a model developed by extending existing, simple one-dimensional theory. The model was applied to a pilot-plant scale channel and a significant decrease in power production was predicted as a result of nonuniform core properties originating in combustor components. In the experimental portion of the study, room-temperature nitrogen was introduced into an ethanol-oxygen combustion plasma in the wake of an injection apparatus upstream of the channel-active section. Measurements were made of Faraday voltages and currents, as well as plasma-voltage distribution. Temperature profiles were measured at the downstream end of the channel-active section using an optical-resonance line-refersal technique. An electrical model was developed which extended the exact averaged Ohm's Law for strictly 1-D nonuniformities to include the case of property variations strong in a preferred direction. Evolution of the temperature perturbatjion was modeled as the solution to the turbulent convective-diffusion equation. When overall heat balance and temperature-profile data were used to determine local property distributions, the quasi-2D model predictions agreed with plasma-impedance measurements over a range of Hall papameter and nitrogen-injection mass-flow rate.

20876 (DOE/ET/15611—T8) Suppression of turbulence in combustion-driven magnetohydrodynamic flows. Reis, J.C. (Stanford Univ., CA (USA). High Temperature Gasdynamics Lab.). Jan 1983. Contract AC01-80ET15611. 192p. NTIS, PC A09/MF A01. Order Number DE83007902.

Thesis.

The influence of a transverse magnetic field on velocity fluctuations in a combustion-driven magnetohydrodynamic (MHD) flow has been experimentally and theoretically investigated and compared to that in liquid metal MHD flows. The measurements were made with a laser Doppler velocimeter in the Stanford M-2 MHD facility. A comparison of the measured mean velocity profiles, with and without magnetic field, indicated only a slight trend toward a more laminar shape, and substantially less change than in liquid metal flows. The turbulence intensity profiles indicated the same degree of suppression in the core, but substantially less suppression in the boundary layers in comparison to liquid metal flows. The difference is attributed to a reduced electrical conductivity in the boundary layer of the combustion-driven flows. A second difference between combustion-driven and liquid metal MHD flows is that the combustion generated turbulence was dominated by long streamers. A theoretical model for turbulence suppression of the combustion streamers was developed. It was shown that for the magnetic field to affect the flow, a gradient in the velocity in the direction parallel to the magnetic field is required, and that without such a gradient, there would be no effect, even with gradients in the density and conductivity. It was seen that turbulence suppression can be considered to be a local Hartmann effect acting between two adjacent fluid eddies. In computing the effects of turbulence suppression in combustion-driven MHD flows, it is recommended to use the models proposed for liquid metal flows, but with the local electrical conductivity.

20877 (DOE/NASA/3249—1) Vaporization thermodynamics of K_2S and K_2SO_3. Bennett, J.E. (Arkansas State Univ., State University (USA). Dept. of Chemistry). Jun 1982. Contract AI01-77ET10769. 64p. (NASA/CR—168080). NTIS, PC A04/MF A01. Order Number DE83008279.

The vaporization reactions, vapor pressures, and thermodynamics of potassium sulfide and potassium sulfite were studied for purposes of providing fundamental data for the seed-cycle in magnetohydrodynamic electric power generation. Rate-of-effusion studies, supported by tube furnace experiments, x-ray powder diffraction, mass spectrometry and apporpriate chemical analyses and tests, revealed that potassium sulfite disproportionates at high temperatures to form potassium sulfide and potassium sulfate. Potassium sulfide was observed to vaporize incongruently, the initial vapors being predominantly potassium atoms, with minor species being S_2 and various K-S molecules. The ratio of K/S_2 in the vapor is very large initially and decreases steadily with prolonged heating. Several materials were evaluated for purposes of containing K_2S/K_2SO_3 at temperatures $\geqq$ 800°C: Pt, Mo, W, Quartz, machinable glass, BN, high density graphite, pyrolytic-coated graphite, and alumina. Of these, only alumina was observed to be chemically inert to both K_2S but reacted with K_2SO_3. The other materials were not suitable for either substance. Thermodynamic calculations based on measured vapor pressures and approximate free energy functions are described. Results from isothermal total mass loss experiments and from thermogravimetric experiments are also included.

20878 (DOE/NBM—3008205) Design of heat-recovery and seed-recovery units in MHD power generation. Bergman, P.D.; Joubert, J.I.; Demski, R.J.; Bienstock, D. (Bureau of Mines, Pittsburgh, PA (USA). Energy Research Center). 1974. 21p. NTIS, PC A02/MF A01. Order Number DE83008205.

Crucial and limiting engineering and materials problems associated with the design of an MHD steam bottoming plant are discussed. Existing experimental and theoretical results on corrosion, fouling and deposits, potassium seed recovery and regeneration, are reviewed. The state of knowledge regarding the design of heat recovery and seed recovery units for coal-fired MHD plants is inadequate at the present time.

20879 **(DOE/NBM—3008229) MHD combustor designs and materials of construction.** Henry, J.M.; Kurtzrock, R.C.; Bienstock, D. (Bureau of Mines, Pittsburgh, PA (USA). Energy Research Center). 1974. 20p. NTIS, PC A02/MF A01. Order Number DE83008229.

This paper reviews various coal combustor designs for MHD applications and describes the conditions which the materials of construction must withstand. The effect of each of the following variables on MHD combustors is discussed: fuel type, air/fuel ratio, oxygen enrichment, and seed addition. The combustor designs are divided into two broad categories - single-stage combustion and multi-stage combustion.

20880 **(LOG-E—763) Axial field limitations in MHD generators. Part 2: Analytical investigation and comparison with experiments.** Unkel, W.; Kruger, C.H. (Stanford Univ., CA (USA)). Jan 1981. 32p. NTIS, PC A03/MF A01.

REFS Backup document for AIAA Synoptic. Analytical Investigation of Axial Field Limitations in MHD Generators", scheduled for publication in Journal of Energy in Jan. - Feb. 1983.

A detailed fluid and electrical model was developed and used to predict the prebreakdown and incipient breakdown characteristics for a simplified configuration. The model shows that an electro-thermal instability, in either the plasma or the interelectrode insulator, was responsible for the breakdown. The predicted values of the threshold voltage, below which breakdown would not occur, were comparable to the experimental values. Detailed comparison of theory and experiment, however, indicates only moderately good agreement, even for the relatively sophisticated model used. Nevertheless, the model can be used to predict the trends of threshold voltage with the channel parameters. Breakdown modeling of the full generator configuration was limited to a coarse electrical solution to simulate the effect of single or multiple breakdowns on the behavior of the surrounding gaps. Moderate success was achieved with the model.

20881 **(NASA-CR—165053) Conceptual design of superconducting magnet system for magnetohydrodynamic (MHD) Engineering Test Facility (ETF) 200 MWE power plant. Final report.** (Massachusetts Inst. of Tech., Cambridge (USA)). Nov 1981. 259p. NTIS, PC A12/MF A01.

A super conducting magnet system conceptual design to meet the requirements of a magnetohydrodynamic test facility power train is presented. A detailed description of the magnet is accompanied by numerous engineering drawings. Functional requirements, system interfaces, and design criteria are reviewed. System limits, safety precautions, operational procedures, and maintenance procedures are discussed.

20882 **(NASA-CR—165453) MHD oxidant intermediate temperature ceramic heater study. Final report.** Carlson, A.W.; Chait, I.L.; Saari, D.P.; Marksberry, C.L. (Burns and Roe, Inc., Woodbury, NY (USA); FluiDyne Engineering Corp., Minneapolis, MN (USA)). Sep 1981. 199p. NTIS, PC A09/MF A01.

The use of three types of directly fired ceramic heaters for preheating oxygen enriched air to an intermediate temperature of 1144K was investigated. The three types of ceramic heaters are: (1) a fixed bed, periodic flow ceramic brick regenerative heater (2) a ceramic pebble regenerative heater. The heater design, performance and operating characteristics under conditions in which the particulate matter is not solidified are evaluated. A comparison and overall evaluation of the three types of ceramic heaters and temperature range determination at which the particulate matter in the MHD exhaust gas is estimated to be a dry powder are presented.

20883 **Method of generating electricity using an endothermic coal gasifier and MHD generator.** Lytle, J.M.; Marchant, D.D. (to Dept. of Energy). US Patent 4,345,173. 17 Aug 1982. Filed date 12 Aug 1980. vp.

PAT-APPL-177327.

A system and method of generating electrical power wherein a mixture of carbonaceous material and water is heated to initiate and sustain the endothermic reaction of carbon and water thereby providing a gasified stream containing carbon monoxide, hydrogen and nitrogen and waste streams of hydrogen sulfide and ash. The gasified stream and an ionizing seed material and pressurized air from a preheater go to a burner for producing ionized combustion gases having a temperature of about 5000° to about 6000° F which are accelerated to a velocity of about 1000 meters per second and passed through an MHD generator to generate dc power and thereafter through a diffuser to reduce the velocity. The gases from the diffuser go to an afterburner and from there in heat exchange relationship with the gasifier to provide heat to sustain the endothermic reaction of carbon and water and with the preheater to preheat the air prior to combustion with the gasified stream. Energy from the afterburner can also be used to energize other parts of the system.

3005 Fuel Cells

20884 **(ANL—82-67) Advanced-fuel cell development. Progress report, July-September 1981.** Pierce, R.D.; Arons, R.M.; Dusek, J.T.; Fraioli, A.V.; Kucera, G.H.; Ryan, L.J.; Sim, J.W.; Smith, J.L.; Stapay, J.R. (Argonne National Lab., IL (USA)). Dec 1982. Contract W-31-109-ENG-38. 47p. NTIS, PC A03/MF A01. Order Number DE83007810.

The report describes fuel cell research and development activities at Argonne National Laboratory (ANL) during the period July through September 1981. These efforts have been directed toward (1) improving understanding of component behavior in molten carbonate fuel cells and (2) developing alternative concepts for components. The principal focus has been on the development of cathodes fabricated form NiO, sintered γ-$LiAlO_2$ electrolyte supports, and diffusion barriers to prevent gas cross-leakage. Cell tests were performed to assess variables affecting diffusion and to study cathode potential relaxation following current interruption.

20885 **(CONF-820508—7) Electrolyte vaporization losses from molten-carbonate fuel cells.** Ong, E.T.; Claar, T.D. (Institute of Gas Technology, Chicago, IL (USA)). 1982. Contract AC02-78ET11276;AC02-80ET17019. 28p. NTIS, PC A03/MF A01. Order Number DE83009382.

From Spring meeting of the Electrochemical Society; Montreal, Canada (9 May 1982).

Electrolyte loss by vaporization has been identified as a significant performance-degradation mechanism in molten-carbonate fuel cells. The continuous nature of electrolyte vaporization leads to development of tile porosity, which results in increased cell resistance, gas crossover, and loss of structural integrity. In this paper, electrolyte losses from fuel cells reported by different investigators are reviewed and out-of-cell measurements of vapor loss from carbonate melts performed at IGT are presented. These out-of-cell vapor losses are then compared with vaporization losses determined from fuel cells operated for 10,000 hours.

20886 **(CONF-8104192—1) National fuel-cell program.** Nelson, P.A.; Hagey, G.; Shimotake, H. (Argonne National Lab., IL (USA); Department of Energy, Washington, DC (USA)). 1981. Contract W-31-109-ENG-38. 16p. NTIS, PC A02/MF A01. Order Number DE83007753.

From Forum on fuel cell and secondary batteries for load leveling; Tokyo, Japan (13 Apr 1981).

Fuel cells are being developed in programs involving industry, utilities, the Department of Energy, the Electric Power Research Institute, the Gas Research Institute, the National Aeronautics and Space Administration, and the Department of Defense. The development and funding of fuel cells in this diverse program is coordinated by the National Fuel Cell Coordinating Group. Systems having phosphoric acid electrolyte are under development for electric utility, industrial and residential applications. These systems will use a variety of fuels from which hydrogen can be derived, such as liquid and gaseous hydrocarbons and alcohols. Advanced fuel cells, having molten carbonate or solid oxide electrolytes and operating at 650°C and 1000°C, respectively, are also being developed for the above applications and for central power stations in which the fuel gas is prepared in a coal gasification plant. The advantages of fuel cells are projected to be high electrical efficiency, low pollution rates, and siting flexibility.

20887 (DOE/ET/11320—T9) **High-temperature fuel-cell research and development. Final technical progress report, 1 Oct 1980-30 Sep 1981.** Lessing, P.; Johnston, M. (Montana Energy and MHD Research and Development Inst., Inc., Butte (USA)). Oct 1981. Contract AC02-77ET11320. 81p. NTIS, PC A05/MF A01. Order Number DE83007925.

This year end report describes work completed on the following tasks: (1) Molten carbonate electrolyte-matrix fabrication and reinforcement using fibers; (2) surface studies of molten carbonate interactions with various metal and ceramic fuel cell components. A novel process has been developed whereby the electrolyte-matrix is batch formulated, tape cast, and hot rolled. The resulting tapes appear to be strong and have good densities but have yet to be tested in an operating environment. Advancing and receding contact angles of molten carbonates (pure and contaminated) on metal and ceramic substrates under various atmospheres at many temperatures are reported. The carbonate composition $(.62Li-.38K)_2CO_3$ exhibits varying degrees of nonwetting in reducing atmospheres (fuel gas) with metal substrates, but wets ceramic (oxides) under both reducing and oxidizing conditions. Temperature and impurities have measurable effects on the contact angles. The application of contact angle and surface tension data to the molten carbonate fuel cells system is discussed in Appendix II.

20888 (DOE/NASA/0251—1) **Study to establish cost predictions for the production of Redox chemicals.** Ammann, P.R.; Loreth, M.; Harvey, W.W. (Charles River Associates, Inc., Boston, MA (USA)). Jul 1982. Contract AI04-80AL12726. 60p. (NASA/CR—167882). NTIS, PC A04/MF A01. Order Number DE83008280.

The chromium and iron chloride chemicals are significant first costs for NASA Redox energy storage systems. This study was performed to determine the lowest cost at which chromium and iron chlorides could be obtained for a complex of Redox energy storage systems. In addition, since the solutions gradually become intermixed during the course of operation of Redox units, it was an objective of this study to evaluate schemes for regeneration of the operating solutions. Three processes were evaluated for the production of chromium and iron chlorides. As a basis for the preliminary plant design and economic evaluation, it was assumed that the plant would produce about 25,000 tons of contained chromium as $CrCl_3$ and an equivalent molar quantity of $FeCl_2$. Preliminary plant designs, including materials and energy balances and sizing of major equipment, were prepared, and capital and operating costs were estimated.

20889 (DOE/R5/10319—1) **High-efficiency residential fuel-cell energy systems. Final report.** Kashkari, C. (Akron Univ., OH (USA). Dept. of Electrical Engineering). Feb 1983. Contract FG02-81R510319. 60p. NTIS (US Sales Only). Order Number DE83008390.

This report includes a basic analysis of a new idea - the use of small fuel cells to supply electricity to homes. The fuel cell would be operated in the cogeneration mode - waste heat would be utilized for home heating and the energy efficiency of the fuel-cell system will be in the range of 80 to 90%. A computer program was used to simulate the system. The results showed that large amounts of heat would be available for domestic heating. Small fuel cells have been manufactured in this country, and there is no technical problem in developing fuel-cell residential energy systems. The only problem appears to be with economics. By promoting such systems on a large scale, fossil-fuel energy resources would be conserved. The economic analysis shows that, at this time, fuel-cell systems would be expensive as compared to conventional energy systems. But if adopted on a large scale, the prices should come down and fuel-cell systems may become economically viable.

20890 **Fuel cell stack arrangements.** Kothmann, R.E.; Somers, E.V. (to Dept. of Energy). US Patent 4,342,816. 3 Aug 1982. Filed date 22 Apr 1981. vp.

PAT-APPL-256419.

Arrangements of stacks of fuel cells and ducts, for fuel cells operating with separate fuel, oxidant and coolant streams are described. An even number of stacks are arranged generally end-to-end in a loop. Ducts located at the juncture of consecutive stacks of the loop feed oxidant or fuel to or from the two consecutive stacks, each individual duct communicating with two stacks. A coolant fluid flows from outside the loop, into and through cooling channels of the stack, and is discharged into an enclosure duct formed within the loop by the stacks and seals at the junctures at the stacks.

32 ENERGY CONSERVATION, CONSUMPTION, AND UTILIZATION

3201 Buildings

REFER ALSO TO CITATION(S) 19977, 20084, 20098, 20193, 20739, 20785, 20863, 20974, 20995

20891 (AD-A—115182/8) **Validation data for mechanical system algorithms used in building energy analysis programs. Final report.** Dolan, W. (Army Construction Engineering Research Lab., Champaign, IL (USA)). Feb 1982. 177p. (CERL-TR-E—177). NTIS, PC A09/MF A01.

A study is described which collected data developers can use to validate the algorithms used by building energy analysis computer programs to model system and central plant performance of typical heating, cooling, and ventilating (HVAC) systems. Building energy analysis programs compute (1) loads imposed on building environmental control systems for each zone, (2) loads imposed on central equipment (using the zone loads and system performance algorithms), and (3) the primary energy demanded by the central- and zone-specific components. The information collected during this study made it possible to compare actual system performances with computer-generated results of system performances. In addition, this study identified some problems common to HVAC systems, including (1) often unreliable controls performance such as drifting away from calibration and poor repeatability, and (2) as-delivered components which do not operate at manufacturers' specifications.

20892 (AD-A—119595/7) **Conduction phase change beneath insulated heated or cooled structures.** Lunardini, V.J. (Cold Regions Research and Engineering Lab., Hanover, NH (USA)). Aug 1982. 48p. (CRREL—82-22). NTIS, PC A03/MF A01.

The problem of thawing beneath heated structures on permafrost (or cooled structures in non-permafrost zones) must be addressed if safe engineering designs are to be conceived. In general, there are no exact solutions to the problem of conduction heat transfer with phase change for practical geometries. The quasi-steady approximation is used here to solve the conductive heat transfer problem with phase change for insulated geometries including infinite strips, rectangular buildings, circular storage tanks, and buried pipes. Analytical solutions are presented and graphed for a range of parameters of practical importance.

20893 (ANL/ENG—82-03) **Study of lighting-system retrofits for energy conservation at ANL-East. In-house Energy Management Surveys and Studies.** York, R.J.; Hirsch, P.R. (Argonne National Lab., IL (USA)). Sep 1982. Contract W-31-109-ENG-38. 133p. NTIS, PC A07/MF A01. Order Number DE83007813.

A number of approaches or techniques gaining recognition and acceptance are: some high-output fluorescent lighting fixtures, high pressure sodium lighting for indoor use, electronic ballasts, specially designed electromagnetic ballasts and compatible lamps, daylight control, task-ambient lighting, time-controlled switching, and manual three-position switching. The objective of this study is to determine the energy and cost benefits obtainable from the application of these specific energy conservation lighting techniques to selected Laboratory building areas, and to determine, on the basis of these benefits, what site-wide applications of these energy conservation lighting techniques would be cost effective.

20894 (BNL—32417) Buoyancy-induced flow studies in thermally stratified loop of a double-envelope building. Ghaffari, H.T.; Jones, R.F. (Brookhaven National Lab., Upton, NY (USA)). 1983. Contract AC02-76CH00016. 7p. (CONF-830405—11). NTIS, PC A02/MF A01. Order Number DE83005908.

From 6. annual ASME technical conference on commercial building heating and cooling applications; Orlando, FL, USA (19 Apr 1983).

There is a wide interest in the flow studies of thermally stratified loops of double-envelope houses. These loops primarily serve to hold a moderate air temperature around the inner buildings, and to reduce thermal losses and air movements into the house by diminishing infiltration. Further, if the thermal mechanism of the building is well designed, it may be possible to cause a solar-assisted, buoyancy-induced cycling of the flow during the day and a probable reverse cycling during the night. The benefits of this flow pattern are a possible storage of heat in the ground level of the crawl space during the day, its retrieval at night, and a better mixing of warmed air in various zones of the loop. The double-envelope section of the building to be discussed here was monitored from October 1981 to October 1982. Data collected were debugged and the monitoring system was adjusted and calibrated. Results from this experiment concerning significant local flows are analyzed. Hence, a validation of the conceptual thermal mechanism is obtained, and empirical and analytical assessments are compared.

20895 (CONF-810295—1) Results of laboratory tests on wood-stove emissions and efficiency. Hubble, B.R.; Harkness, J.B.L. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 19p. NTIS, PC A02/MF A01. Order Number DE83007784.

From International trade show and wood heating seminar; New Orleans, LA, USA (21 Feb 1981).

Air-tight, wood-burning stoves were operated in a manner consistent with typical residential heating requirements in order to determine particulate and carbon monoxide emissions and creosote build-up. Test data are presented as functions of burn-rates and stove efficiencies. The principal conclusions are that emissions from the stove used in this study are related to log-size and wood burn-rate and that CO and particulate emissions and creosote build-up increased with increasing efficiency of operation. Therefore, future environmental testing should be conducted at typical stove operating conditions, low burn-rates with large logs. In addition, heat-loss calculations show a trade-off between sensible heat loss and CO-fuel heat loss over the range of burn-rates studied. This indicates that, if further improvements in stove efficiencies are desired, improvements in stove combustion efficiency are needed. This also decreases stove emissions.

20896 (CONF-830122—3) Opportunities for improved residential cool-storage systems. Kuliasha, M.A. (Oak Ridge National Lab., TN (USA)). 1983. Contract W-7405-ENG-26. 9p. NTIS, PC A02/MF A01. Order Number DE83007508.

From Electric Power Research Institute cool storage workshop; Palo Alto, CA, USA (19 Jan 1983).

During a nationwide concept test program for residential load management using ice storage data were collected from 208 cool storage installations utilizing storage equipment from four manufacturers and 134 control homes with conventional air conditioning. While the data from these tests are currently being analyzed, the qualitative results from these and other tests indicate a number of areas where opportunities exist for improvements in existing cool storage designs. The problem areas of energy efficiency, reliability, storage capacity, condensing unit capacity, and unit cost and the alternatives which have been suggested for alleviating some of the problems which have been experienced are discussed.

20897 (CONF-8106188—1) New ways of heating and cooling buildings with electricity. Asbury, J.G. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 14p. NTIS, PC A02/MF A01. Order Number DE83007873.

From Workshop on the electric imperative; Monterey, CA, USA (Jun 1981).

Case studies of two electric utility service areas indicate that heating with electricity is cost-competitive with oil and natural gas heating, providing that the electric utility meets its intermediate and base loads with coal and/or nuclear generating plants. (MHR)

20898 (DOE/MA—0004/1) FY 1981 annual report on In-House Energy Management. (USDOE Assistant Secretary for Management and Administration, Washington, DC. Office of Facility Planning and Support). Sep 1982. 57p. NTIS, PC A04/MF A01. Order Number DE83007583.

To promote the efficient and economical use of energy at its facilities, DOE has implemented an In-house Energy Management Program designed to reduce energy consumption and increase energy efficiency in its buildings and general operations. The Department's Energy Management Program includes two major areas of effort: buildings energy conservation and general operations energy conservation. The buildings program effort is directed toward improving energy efficiency in the Department's building envelope energy consumption. The general operations progam is aimed at increased energy efficiency in process, production, research, vehicular, and other equipment energy usage. Detailed surveys of major experimental production operations, as well as buildings energy consumption, have been completed or are underway at DOE sites to identify ways to reduce energy consumption. Retrofit projects submitted by DOE's field offices are reviewed and analyzed. Recommended projects are evaluated and prioritized based on their relative merit in accordance with approved life cycle costing procedures.

20899 (DOE/NBM—3008768) Energy conservation manual for multi-family dwellings. (Myers Associates, Inc., Towson, MD (USA); Dale (Jack) Associates, Inc., Towson, MD (USA)). [nd]. 96p. NTIS, PC A05/MF A01. Order Number DE83008768.

A number of the activities involved in managing fuel consumption in apartments, condominiums, and other multi-dwelling unit buildings are presented, and a number of specific recommendations are listed for operating and maintenance procedures and capital investments in new equipment and materials which can reduce energy consumption in those types of buildings. Roles, responsibilities, and actions to be taken are presented for both landlords and tenants. (LEW)

20900 (DOE/PC/30153—T1) Wood-fuel use in Papua New Guinea: an assessment of industrial combustion equipment. Mendis, M.S. (Mitre Corp., McLean, VA (USA). METREK Div.). Nov 1980. Contract AC22-80PC30153. 239p. NTIS, PC A11/MF A01. Order Number DE83006535.

This report presents the results of an engineering and economic assessment of new and retrofit industrial combustion equipment for wood-fuel use in Papua New Guinea. Existing industrial combustion equipment and practices in Papua New Guinea are appraised. Potential industrial wood-fuel systems that utilize wood, wood wastes, charcoal and pyrolytic oils and which are particularly applicable to Papua New Guinea are identified. An economic assessment of wood-fuel systems is conducted for eleven case studies which are representative of a cross-section of Papua New Guinea industry. Conclusions and recommendations are presented to aid both government and industry in Papua New Guinea in fostering the development of appropriate wood-fuel technologies and thereby help displace the consumption of imported petroleum.

20901 (ERATL—83-01) Building services automation. Final report. Bull, R.G.; Baker, P.D.W. (ERA Technology Ltd., Leatherhead (UK)). Jul 1981. 302p. NTIS PC $170.00.

Automatic systems for controlling building services and energy management are becoming increasingly attractive to users of buildings of quite modest sizes and achieve remarkable pay-back periods averaging less than 15 months. The choice of systems available, usually based on microprocessor technology, is difficult for potential users. This report describes the main systems available and compares 35 case studies of users carefully selected to represent current UK practice. It describes the factors which affected their choice and analyses the benefits obtained compared with those expected.

20902 (EUR—7048-EN) Analysis of the factors which determine the COP of a heat pump and a feasibility study on ways and means of increasing same. Fordsmand, M.; Eggers-Lura, A. (Commission of the European Communities, Luxembourg). 1981. 131p. Available from Commission of the European Communities, Luxembourg.

The various possibilities of heat extraction and heat delivery for a water/water heat pump are reviewed, and their technical and economical merits are evaluated. Data are presented on the conditions in the ground. Data relating to ground heat pumps in combination with solar collectors are presented. Two simplified models are described for the calculation of the heat output from horizontal and vertical ground pipes. The Skive-house and its solar/heat pump installation are described, and data are presented from the first 18 months' measurements on same.

20903 (EUR—7939-DE) Signal transmission via the electrical house wiring system for a control system for energy conservation in households and small business. Neudorfer, E.; Radde, H.; Sewald, A. (Commission of the European Communities, Luxembourg). 1982. 94p. (In German). Commission of the European Communities, Luxembourg.

The objective of this project was the definition of a serial data transmission unit which uses the electric house wiring for transmission and which is intended to support the application of microelectronic for the purpose of energy conservation in household and small business. First the requirements to a 'Energy Management System' (Measurement, Control Optimisation) in household and small business, the limitation, caused by system environment, and the state of the art have been examined. After design and experimental examination of different solutions of particular functions, samples of a transmission and interface module have been built up and tested within a special test arrangement and with the real mains.

20904 (GAO/HRD—82-77) Millions can be saved through better energy management in federal hospitals. (General Accounting Office, Washington, DC (USA). Office of the Comptroller General). 1 Sep 1982. 61p. General Accounting Office, P.O. Box 6015, Gaithersburg, MD 20760.

Report to The Congress .

A comparison of the energy savings achieved by hospitals of the Navy, Veterans Administration, and Indian Health service - all of which have energy conservation programs - with that of five non-federal hospitals having aggressive energy management programs indicated that these agencies could save between $16 million and $55 million more each year if additional energy-saving measures were adopted. The investment required to achieve these savings would be quickly recouped. GAO believes that additional energy-saving opportunities also exist at the Army and Air Force hospitals. Two important program elements - technical audits to identify cost-effective energy conservation measures and accountability to ensure that the measures are implemented - are generally missing or incomplete in federal hospitals' energy conservation efforts. By increasing emphasis on these elements, federal agencies could achieve many of the yet unrealized energy savings.

20905 (LA-UR—83-397) Energy-conservation study for the US Air Force Academy. Peterson, J.L.; Davis, L.B. (Los Alamos National Lab., NM (USA)). 1983. Contract W-7405-ENG-36. 127p. (CONF-830319—1). NTIS, PC A07/MF A01. Order Number DE83007554.

From US Air Force Academy energy management personnel meeting; Colorado Springs, CO, USA (1 Mar 1982).

The United States Air Force Academy (AFA) has asked the Los Alamos National Laboratory to assist them in conducting detailed energy and solar analyses of selected AFA buildings using the DOE-2 building energy analysis computer program. The results of the energy conservation study conducted by Los Alamos in FY 1981 and 1982 for Building 2360 (Vandenberg Hall), Building 2169 (Field House), and Building 2410 (Aeronautics Laboratory) are presented. Energy Conservation and Solar Opportunities (ECOs) are identified for each building and predicted heating, cooling and electric energy savings are presented for each ECO. Economic results are summarized as annual dollars saved, discounted benefit-to-cost ratio, maximum investment targets, and the life-cycle cost of implementing each ECO.

20906 (LBL—15183) Energy efficiency in Chinese apartment buildings: parametric runs with the DOE.2 computer program. Huang, Y.J.; Canha de Piedade, A.; Rosenfeld, A.H.; Tseng, D. (Lawrence Berkeley Lab., CA (USA)). Nov 1982. Contract AC03-76SF00098. 32p. (CONF-821121—3; EEB—82-3). NTIS, PC A03/MF A01. Order Number DE83008253.

From 1. US/China conference on energy, resources and environment; Beijing, China (7 Nov 1982).

Using a typical-design uninsulated Beijing apartment building as a base case, we have used the DOE.2 energy analysis program to study the cost-effectiveness of more energy-efficient building design. Two measures have attractive simple payback times: reduced infiltration (one to two years payback) and insulation of the north wall (six years). The cost of conserved coal for the insulation measure is 1.3 Yuan/GJ, which is less than half the international price of coal. This insulation adds only 0.6% to the first cost of the building, yet, combined with more attention to infiltration, it reduces annual heat load from 230 MJ/m^2 to 130. The first cost of these two measures is probably offset by downsizing the heating plant. In Shanghai, reduced infiltration and insulation are justified not on the basis of saving fuel, but because they make the dwellings much more comfortable.

20907 (LBL—15374) Progress in energy-efficient buildings. Wall, L.W.; Rosenfeld, A.H. (Lawrence Berkeley Lab., CA (USA)). Dec 1982. Contract AC03-76SF00098. 25p. (CONF-830211—1). NTIS, PC A02/MF A01. Order Number DE83006953.

From 5. energy audit symposium and productivity exposition of the Association of Energy Engineers; Los Angeles, CA, USA (17 Feb 1983).

Recent accomplishments in buildings energy research by the diverse groups in the Energy Efficient Buildings Program at Lawrence Berkeley Laboratory (LBL) are summarized. Technological progress is reviewed in the areas of ventilation and indoor air quality, buildings energy performance, computer modelling, windows, and artificial lighting. The need for actual consumption data to track accurately the improving energy efficiency of buildings is being addressed by the Buildings Energy Data (BED) Group at LBL. Results to date are summarized from the Building Energy Use Compilation and Analysis (BECA) studies, which include time trends in the energy consumption of new commercial and new residential buildings, the measured savings being attained by both commercial and residential retrofits, and the cost-effectiveness of buildings energy conservation measures. Recent comparisons of predicted vs actual energy usage/savings, and present the case for building energy use labels are also examined.

20908 (N—8229715) Retrofit energy conservation in residential buildings in southern California. Turner, R.H.; Birur, G.C.; Daksla, C. (Jet Propulsion Lab., Pasadena, CA (USA)). Jun 1982. 43p. (NASA-CR—169137; JPL-PUBL—82-55). NTIS, PC A03/MF A01.

The common energy conservation techniques (ECTs) that can be retrofit-installed into residential buildings are surveyed. The quantity of saved energy for heating and cooling attributable to each ECT is evaluated for three common modes of heating: natural gas heating at 60/therm heating via heat pump at $1.20/therm and electric resistance heating at $2.40/therm. In every case, a life cycle cost comparison is made between the long term revenue due to energy conservation and a safe and conventional alternative investment that might be available to the prudent homeowner. The comparison between investment in an ECT and the alternative investment is brought into perspective using the life cycle payback period and an economic Figure of Merit (FOM). The FOM allows for relative ranking between candidate ECTs. Because the entire spectrum of winter heating climates in California is surveyed, the decision maker can determine whether or not a considered ECT is recommended in a given climate, and under what conditions an ECT investment becomes attractive.

20909 (NASA-TM—83175) **Design of an energy conservation building.** Jensen, R.N. (National Aeronautics and Space Administration, Hampton, VA (USA). Langley Research Center). Nov 1981. 32p. NTIS, PC A03/MF A01.

The concepts in designing and predicting energy consumption in a low energy use building are summarized. The building will use less than 30,000 Btu/sq.ft./yr. of boarder energy. The building's primary energy conservation features include heavy concrete walls with external insulation, a highly insulated ceiling, and large amounts of glass for natural lighting. A solar collector air system is integrated into the south wall. Calculations for energy conservation features were performed using NASA's NECAP Energy Program.

20910 (NP—3900026) **Heat transfer through transparent and non-transparent outer walls with a curtain of adjustable light shades.** Gehlisch, K. (Technische Univ. Muenchen (Germany, F.R.). Fakultaet fuer Maschinenwesen). 24 Jul 1981. 185p. (In German). NTIS (US Sales Only), PC A09/MF A01. Order Number DE83900026.

Thesis.

The use of so-called louvers - a method applied and approved in astronautics - in buildings in order to save energy is studied. Shutters in buildings have got the function of influencing the radiation from and to the building in such a way that the need for heating and cooling is reduced. A physical model of a louver system is developed which can be computed by a mathematical calculus. For the mathematical model a computer code is set up allowing to simulate the environmental conditions. Experimentally heat transfer on a vertical wall is investigated using a system of shutters. The results are compared with published data. In addition the studies are extended to the use of shutters in front of windows.

20911 (NYSERDA—82-26) **Design and demonstration of a storage assisted air conditioning system.** (Long Island Lighting Co., Mineola, NY (USA); State Univ. of New York, Stony Brook (USA)). Apr 1982. Contract W-7405-ENG-26. 93p. NTIS, PC A05/MF A01. Order Number DE83008255.

One phase-change material, sodium sulfate decahydrate, has generated considerable interest for thermal storage. A form of this material containing salts to adjust the transition point to approximately 55°F and a gelling agent to prevent segregation of the salts has been developed. This material is packaged in the form of a CHUB, (a cylinder two inches in diameter and twenty inches long) having a weight of 3.25 pounds and a thermal storage capability of 50 Btu per pound. Under this project, a storage-assisted (partial storage) air conditioning system was designed, installed, monitored and evaluated in a typical residential application. This feasibility demonstration was conducted under the direction of the Long Island Lighting Company in a single family residence in Melville, Long Island, New York. The demonstration system consisted of a CHUB thermal storage system utilized in conjunction with a one and one-half ton air conditioning unit to cool a house that would normally require a two and one half ton air conditioning unit.

20912 (ORNL/CON—120) **Methods to deal with self-selection in estimating conservation-program energy savings: use of synthetic data to test alternative approaches.** Hirst, E.; Trimble, J.; Goeltz, R.; Cardell, S. (Oak Ridge National Lab., TN (USA)). Mar 1983. Contract W-7405-ENG-26. 47p. NTIS, PC A03/MF A01. Order Number DE83008138.

Because energy-conservation programs are generally voluntary, households that choose to participate in the programs are almost certain to be different from nonparticipants in important energy-related ways. This self-selection bias greatly complicates efforts to estimate energy savings due to the program. Several methods for dealing with self-selection are discussed. The methods involve either nonrandom sampling of program nonparticipants, binary choice models that explicitly treat household decisions to participate and to retrofit, or both. Because some of the methods discussed are new and have not yet been applied to analysis of energy-conservation programs, a synthetic data set was developed. Numerical experiments were conducted with this data to examine the performance of these different methods. These experiments show that the improved sample design and analytical techniques generally yield more-accurate estimates of program energy savings. Our experience also suggests that a small, well-defined synthetic data set is very helpful in developing, debugging, and evaluating software associated with new analytical approaches.

20913 (ORNL/CON—121) **Residential Conservation Service Program: summary of the second annual reports submitted to the US Department of Energy by states and nonregulated utilities. Final report.** Morris, L.E.; Frogge, L.M.; Ehrenshaft, A.R.; Riordan, J.M. (Oak Ridge National Lab., TN (USA)). Feb 1983. Contract W-7405-ENG-26. 135p. NTIS, PC A07/MF A01. Order Number DE83008304.

This report is a presentation and summary of the data submitted in the second Annual Reports by States and Non-Regulated Utilities detailing the activity level of Residential Conservation Service (RCS) Program elements on a national, state, and local level as of March 31, 1982. Several tables are included which present the reported data (i.e., number of eligible customers, number of audits performed, utility services offered, and RCS Program implementation costs) in a format where state-to-state and utility-to-utility comparisons can be made. Comparative analysis indicates that the program information submitted in the Annual Reports is incomplete and varies significantly from one state or utility to another.

20914 (ORNL/Sub—9001/1) **Aerial measurement of heat loss: Phase II.** (Calspan Corp., Buffalo, NY (USA)). Jul 1982. Contract AC01-78CS20415. 174p. (NYSERDA—82-7). NTIS, PC A09/MF A01. Order Number DE83002729.

The purpose of the program described was to develop techniques to reduce or eliminate some of the variables associated with thermogram analysis in order to provide more objective interpretation of the data collected with greater potential for accuracy. A procedure is given for measuring temperature which accounts for atmospheric, background, and differential emissivity effects. The residual error was found to be 1.0°C. A technique was then identified and developed for determining heat loss lovels from roof top surface temperature data. A thermal integrity factor was defined as a function of insulation level and thermostat setting. Comparing these thermal integrity factors with aerial thermography data indicates that aerial thermography can be used to objectively and confidently define heat loss levels from building roofs. (LEW)

20915 (P—400-81-022) **1981/82 nonresidential building standards development project: use of computerized graphics to optimizae building energy use in predesign and programing.** Busch, R.D.; Bickle, L.W. (California Energy Resources Conservation and Development Commission, Sacramento (USA). Conservation Div.). Aug 1981. 6p. California Energy Commission, 1516 Ninth Street, Sacramento, CA 95814.

The energy graphics method has been developed and refined. This technique utilizes a series of plots to compare te external and internal effects on the overall energy use in a building. To enhance this technique, we have put it on the computer and included the effects of mass and deadband thermostat in the program. Utilizing the architectural program and client information, the designer has two possible techniques for reducing the energy consumption in the building: (1) reduce the auxiliary load required by minimizing the heat gain or heat loss that occurs at that particular point in time; or (2) shift the heat gain or heat loss out of the occupied time so that the comfort onditions in the building are less restrictire. Utilizing the visual graphics from the program, the designer can go through a systematic process inreducing and shifting the heat losses and heat gains so that the auxiliary load on the building is minimized.

20916 (PB—82-205212) **Evaluation of the Vuilleumier heat pump for heating applications. Vtt research report.** Nykyri, M.; Hiismaeki, P. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland). Reaktorilab.). [nd]. 30p. NTIS, PC A03/MF A01.

A general evaluation of the performance of a Vuilleumier heat pump for residential heating is given. The basic considerations were devoted to the choice of hot, intermediate and cold operating volumes and temperatures, to the phase angle of the two displacers, to the dead volumes and to the choice of the working gas. Specific attention was then paid to the heat transfer problems at each of the three temperatures.

20917 **(PB—82-220575) Effect of building characteristics on gas-appliance performance and end-use efficiency. Final report 1 Dec 80-31 Oct 81.** Zawacki, T.S.; Cole, J.T.; Huang, V.; Macriss, R.A. (Institute of Gas Technology, Chicago, IL (USA)). May 1982. 82p. NTIS, PC A05/MF A01.

Analyses of the effect of how building structure and other factors influence retrofit performance were carried out through analytical investigations and measurements in homes. A data base of 65 sites was established from screening 2600 sites. A comprehensive list of operative factors linking retrofit effectiveness to structural and installation factors was developed and used. Semi-empirical relationships were developed to estimate retrofit effectiveness based on easily measured or observed parameters.

20918 **(PB—82-227661) High-efficiency, gas-fired heat-pipe, warm-air heating system. Final report on phase 1, Jun 79-Jun 81.** Becker, F.E.; Searight, E.F.; Sumberg, A.J. (Thermo Electron Corp., Waltham, MA (USA)). Dec 1981. 49p. (TE—4296-133-82). NTIS, PC A03/MF A01.

A totally integrated gas-fired, warm-air heating system has been developed. The design concept combines a unique high-efficiency heat-pipe furnace capable of being continuously modulated to match the heat-load requirement, a novel distribution system with individual thermostatically controlled room diffusers, and a control system designed to provide maximum furnace efficiency at all load levels and to allow for individual room temperature control. A prototype 100,000-Btu/hr heat-input warm-air furnace has been built and tested. The furnace is approximately one-half the size of most conventional units and operates with a steady-state efficiency of 86 percent. The furnace has successfully operated through a turndown ratio of 4 to 1. A simple, reliable, thermostatically controlled room diffuser has also been developed and life cycle tested.

20919 **(PB—82-229634) Cross-subsidization and competition: a case study of gas and electric utility involvement in residential energy conservation. Final report.** Mead, W.J.; Parsons, S.G.; Sorensen, P.E. (California Univ., Santa Barbara (USA). Community and Organization Research Inst.). 23 Jun 1982. 208p. NTIS, PC A10/MF A01.

Frequently profits from one level of operation or in one product line are used by vertically integrated or conglomerate firms to subsidize sales made at another level or in another industry. This permits price cutting which can drive small firms out of business. This study will include the development of a theoretical model of firm behavior on potential gains versus losses from cross subsidization. The model will be tested using data on the sale of home insulation materials and services by electric and gas companies.

20920 **(PB—82-229915) Economic assessment of residential retrofit electricity conservation measures: consumer and utility perspectives. Staff report.** House, L.W.; Gertner, P.; Amir, E. (California Energy Resources Conservation and Development Commission, Sacramento (USA)). Oct 1981. 60p. NTIS, PC A04/MF A01.

Analyses of conservation technologies have typically concentrated on consumer investment criteria. This has had the effect of seriously limiting the ability to compare conservation measures directly to energy supply options. A methodology is demonstrated that allows comparison of the cost effectiveness of conservation measures from three different perspectives: a private consumer's perspective (with and without policy incentives); a utility's short-run perspective; and a utility's long-run perspective. Nineteen residential electrical conservation measures currently available were analyzed. From the consumer's perspective, the cost of conserving energy was compared with the price the consumer is expected to pay for electricity over the next 10 years. For the utility's short-run perspective, the cost of conserving energy was compared to the fuel cost of generating that electricity (taking into account time of day and season of energy savings). In the utility's long-run perspective, the cost of conserving energy was compared with the cost of electricity from various existing and new generation facilities. Pacific Gas and Electric Company (PG and E) was the utility analyzed.

20921 **(PB—82-231168) Combustion modification controls for residential and commercial heating systems. Volume I: environmental assessment. Final task report Jun 78-Sep 79.** Castaldini, C.; Brown, R.A.; Lim, K.J. (Acurex Corp., Mountain View, CA (USA). Energy and Environmental Div.). Jul 1981. 177p. NTIS, PC A09/MF A01.

An environmental assessment is given of combustion modification techniques for residential and commercial heating systems, with respect to NOx control reduction effectiveness, operational impact, thermal efficiency impact, control costs, and effect on emissions of pollutants other than NOx. Major equipment types and design trends are reviewed, although emissions and control data for commercial systems are very sparse. Natural gas and distillate oil are the principal fuels.

20922 **(PB—82-231176) Combustion modification controls for residential and commercial heating systems. Volume II: oil-fired residential furnace field test. Final task report Jul 78-Jul 79.** Higginbotham, E.B. (Acurex Corp., Mountain View, CA (USA). Energy and Environmental Div.). Jul 1981. 79p. NTIS, PC A05/MF A01.

Methods and results are given of an environmental assessment test program at an oil-fired, low-emission residential heating unit. The aim of the program was to measure emission changes resulting from changing the operating mode of the low-emission furnace. Emissions of trace elements, organic materials, sulfur species, NO, CO, hydrocarbons, and particulate matter were measured. Both continuous and cyclic operating modes were evaluated.

20923 **(PB—82-260811) Nontechnical summary of the final report 'optimal weatherization of low-income housing in the united states: a research demonstration project'. Final report Sep 77-Sep 81.** Margulis, S.T.; Clark, R.E. (National Bureau of Standards, Washington, DC (USA). Center for Building Technology). Aug 1982. 45p. NTIS, PC A03/MF A01.

In nontechnical language the nature and results are summarized of the Community Service Administration's (CSA's) Optimal Weatherization Demonstration Research Project carried out by the National Bureau of Standards (NBS). The CSA/NBS demonstration installed both architectural (Building shell) and mechanical systems weatherization options, and achieved, when both types of options were used, an average reduction in space heating fuel consumption of 41 percent, at an average weatherization cost of $1,862 per house.

20924 **(PB—82-262296) Building digests: heating and thermal aspects of building.** Chandra, P.; Agarwal, K.N.; Jain, S.P.; Sharma, M.R.; Ali, S. (Central Building Research Inst., Roorkee (India)). 1981. 94p. NTIS, PC A05/MF A01.

Fourteen bulletins are compiled covering: Thermal Performance of Building Sections in Different Thermal Climatic Zones of the Country; Thermal Response of 4.5 inch Solid Brick Wall Room in Hot-Dry Climates; Evaluation of Thermal Stress-Tropical Summer Index; Correction Factors for Thermal Performance Index; Thermal Performance Rating and Classification of Walls in Hot Climate; Thermal Performance Rating and Classification of Flat Roofs in Hot Dry Climates; Thermal Insulation at Low Temperature; Thermal Data of Building Fabrics and its Application in Building Design; Assessment of Solar Radiation on Buildings; Determination of Tropical Summer Index in Office Buildings; Determination of Sunlight Penetration Indoors; Orientation of Buildings; The Climatic and Environmental Zones for India - Simplified Advice for Building Design; and Thermal Considerations in Building Design - Insulated Masonry Structures. These bulletins provide comprehensive, step-by-step instructions on how to make full use of the techniques described. Many graphs and charts are provided.

20925 **(PB—82-262957) For building and construction. Technical notes.** Bansal, G.D.; Sharma, D.; Prakash, C.; Rao, K.R.; Jain, S.P. (Central Building Research Inst., Roorkee (India)). 1981. 58p. NTIS, PC A04/MF A01.

Sixteen technical notes are compiled coveering: Apertures other than Northlights; Design of pile caps; thermal insulation of roofs of industrial buildings; room heating by solar energy; charging device for small capacity lime kilns; waste water disposal system for rural areas; low cost sound absorbing materials; solar space heating system; pedestal piles for low cost houses; solar timber seasoning kiln; design of cold storage for fruits and vegetables; techniques for improved thatch roofs; resilient floors for structural noise reduction; plastic composite panels for partition claddings and flush doors; chimney design for domestic kitchens; and a cheap and effective fire retardant treatment for paddy thatch/coconut leaves/palmyrah thatch. The notes give brief descriptions of the design and use of the materials and techniques covered.

20926 (PB—82-266271) Building digests: cooling of buildings. Verma, V.V.; Agarwal, K.N.; Chadra, P.; Jain, S.P.; Sharma, M.R. (Central Building Research Inst., Roorkee (India)). 1981. 47p. NTIS, PC A03/MF A01.

Nine bulletins are compiled covering: Control of Solar Heat Gain through Glass Windows; Simple and Effective Roof Spraying System of Cooling Buildings in Hot Dry Climates; Shading Devices for Glass Openings in Air-conditioned Buildings; Cooling of Buildings by Roof Surface Evaporation; Roof-surface Evaporative Cooling of Buildings by Water Soaked Gunny Bags; Loose Fill Materials for Cold Storage Insulation; Cooling Load and Indoor Air Temperature of Office Buildings under Tropical Climate; Thermal Design of Potato Cold Storage; and Suitability of Rice-husk and Saw-dust as a Cold Storage Insulation. These bulletins provide comprehensive, step-by-step instructions on how to use the materials and techniques covered.

20927 (PB—83-100479) Energy and the built environment. Olofsdotter, B. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1982. 77p. NTIS, PC A05/MF A01.

Contents include Swedish energy policy; Energy supply; The built environment; A strategy for conversion of the Swedish energy system; Energy planning; Transport; Low-energy building and building services; Low-energy houses; Heat pumps; Solar energy space heating; Heat storage.

20928 (PB—83-101907) Building digest - general building aspects. Damodaran, K.; George, J.; Rehsi, S.S.; Singh, S.; Sofat, G.C. (Central Building Research Inst., Roorkee (India)). 1981. 76p. NTIS, PC A05/MF A01.

Thirteen bulletins are compiled covering Flush Doors; Wood Seasoning; Proportioning of Fly Ash Concrete Mix; The Yield of Mortar and Concrete Mix; Solar Water Heater - Domestic Type; Units for Living; Plastics and their Applications in Buildings; Hardboard and Particle Board; Woodwool Board; Material Constants in Building Works; Check-list for Taking Over Newly Constructed Buildings; Some Typical Enquiries and their Replies; and Energy Conservation in Buildings. These bulletins provide a comprehensive, step-by-step set of instructions on how to make and use the materials and techniques covered. Wood preservation and termite and rodent resistance of plastic pipes is also covered.

20929 (PB—83-117317) Optimal weatherization of low-income housing in the U.S.: a research demonstration project. Building science series (final). Crenshaw, R.; Clark, R.E. (National Bureau of Standards, Washington, DC (USA). Center for Building Technology). Sep 1982. 172p. NTIS, PC A08/MF A01.

This report describes and presents the results of the Community Service Administration's (CSA's) Optimal Weatherization Demonstration Research Project carried out by the National Bureau of Standards (NBS). The CSA/NBS demonstration installed both architectural (building shell) and mechanical systems building weatherization options, and achieved, when both types of options were used, an average reduction in space heating fuel consumption of 41 percent, at an average weatherization cost of $1,862 per house.

20930 (PB—83-117382) Evaluation of existing programs for simulation of residential building energy use. Final report. Merriam, R.L.; Rancatore, R.J. (Little (Arthur D.), Inc., Cambridge, MA (USA)). [nd]. 255p. NTIS, PC A12/MF A01.

A review and evaluation of residential building energy analysis programs is carried out in six steps: (1) survey of the experience and needs of electric and gas utilities in residential building energy analysis; (2) identification and characterization of currently available programs capable of residential energy use analysis; (3) examination and summary of the intended capabilities of ten programs; (4) indepth analysis of the engineering bases of five programs; (5) test of the same five programs; and (6) establishing the strengths and limitations of the programs. Classification of the various analysis methods for estimating residential energy use is provided as a background for the study. The history of the development of the various programs is summarized and the various thermal loads algorithms commonly employed are discussed.

20931 (PB—83-118646) Building technology project summaries, 1981-1982. Special pub. Raufaste, N.; Olmert, M. (National Bureau of Standards, Washington, DC (USA). Center for Building Technology). Sep 1982. 74p. NTIS, PC A04/MF A01.

Center for Building Technology programs address building construction productivity, structural and geotechnical engineering, building materials, building physics, and building equipment. Typical CBT activities include: investigating failures, such as the Kansas City Hyatt Regency Hotel skywalk collapse, to determine needs for improved design and construction practices; improving measurement techniques, such as development and calibration of a hot-box to accurately determine heat transfer in full-scale complex-work assemblies; defining characteristics of building performance, such as predicting service-life of polymers (a group of materials expected to see much more use during the 21st century); and developing methods to predict the energy performance of new refrigerant mixtures for heat pumps. This report summarizes CBT's research for 1981-1982. Each summary lists the project title, its progress, point of contact within CBT, and sponsor.

20932 (PB—83-118869) Building technology publications supplement 6: 1981. Special pub. (final). Beavers, L. (National Bureau of Standards, Washington, DC (USA). Center for Building Technology). Jun 1982. 98p. NTIS, PC A05/MF A01.

This report presents NBS' Center for Building Technology (CBT) publications for 1981. It is the sixth supplement to NBS Special Publication 457, Building Technology Publications, and lists CBT reports issued during January 1 - December 31, 1981. It includes titles and abstracts of each CBT publication and those papers published in non-NBS media, key word and author indexes, and general information and instructions on how to order CBT publications.

20933 (PB—83-122978) Field correlation of performance standards for organically sealed sinsulating glass. Spetz, J.L. (Sealed Insulating Glass Manufacturers Association, Chicago, IL (USA)). 15 Dec 1980. 280p. NTIS, PC A13/MF A01.

This study correlates the test performance of Sealed Insulating Glass with its performance in use in buildings in the United States. Approximately 2,000 units in approximately 150 buildings are being tested each year for 5 years. The tests measure the amount of moisture between the two panes of sealed glass and determine the level of performance according to specifications. All common generic type of sealant systems, single and dual seal, are represented among the units tested, as are all three desiccant systems and all common sealed corners and corner key constructions. Findings indicate no visual failures of moisture or fog inside any of the units tested and no visual failures on any of the units on the jobs. Summary data sheets and individual job data sheets with all the frost points for the individual cities for the various tests used are included.

20934 (PB—83-123802) Annual housing survey: 1979. United States and regions. part f: energy-related housing characteristics. (Bureau of the Census, Washington, DC (USA)). Mar 1982. 375p. NTIS, PC A16/MF A01.

This report presents statistics on energy - related housing characteristics from the 1979 Annual Housing Survey for the United States by inside and outside standard metropolitan statistical areas (SMSA's) and each of the four geographic regions. The statistics are based on information from a sample of housing units. The information was collected by personal interview from September 1979 to December 1979. For the United States as a whole and for the separate regions (North Central, Northeast, South, and West), data are presented on fuel, fuel cost, heating, air conditioning, insulation, and transportation characteristics in relation to the following information: income of families and primary individuals, value of owner - occupied housing units, gross rent of renter - occupied housing units, housing units in structure, number of rooms per housing unit, year structure built, monthly cost paid for electricity, and others. Also shown are the yearly cost paid for fuel oil, coal, etc. and household head's principal means of transportation to work, by distance and travel time to work in 1979. Data are classified according to all races, black - housing units with black household head, and Spanish - housing units with household head of Spanish origin. Maps and a table - finding guide are provided. Appendices describe the geographic area classifications; define subjects covered in the report; and present information on sample design, estimation, and data accuracy.

20935 (PB—83-124347) Evaluation of the physical condition of public housing stock. Volume I: final report. Final report. (Perkins and Will, Inc., Washington, DC (USA)). 31 Mar 1980. 271p. NTIS, PC A12/MF A01.

This report summarizes a 2 - year study pertaining to modernization, accessibility, and energy conservation in public housing stock. It developed cost estimates to upgrade public housing to three levels of modernization. Level I required the correction of all basic safety and health standards. Level II included the cost of correcting all level I violations as well as all violations of HUD Minimum Property Standards modified to reflect the special conditions of modernization. Level III covered the cost of selected modernization improvements to make projects more habitable, easier to maintain, or more attractive. The national estimate (in 1980 dollars) for level I improvements for 1.17 public housing million units was about $260 million. For level II, the national estimate was $1.506 billion, and for level III, $6.791 billion. The study also developed cost estimates to upgrade public housing to fulfill the national barrier - free legislation requirements. Estimates for major categories of disabilities are delineated for making 58,650 units accessible. In the last area, energy conservation, estimates were developed of the costs and benefits (expressed in terms of discounted payback periods) required to implement a comprehensive list of energy conservation measures in public housing. Tables, figures, and photographs are supplied. Methodology and statistical analyses are appended.

20936 (PB—83-124370) Evaluation of the physical condition of public housing stock. Volume 4: energy conservation. (Perkins and Will, Inc., Washington, DC (USA)). 31 Mar 1980. 352p. NTIS, PC A16/MF A01.

This report assesses the existing energy consumption and energy conservation potential in the Nation's public housing stock. It presents recommended levels of energy saving investment costs based on a cost / benefit analysis. The cost of energy in the public housing stock for 1980 is expected to exceed $740 million, which averages out to over $670 per dwelling unit. The analysis of the total public housing stock was completed in a two - phases survey and analysis process. A total of 350 randomly selected projects were surveyed, and 95 of these were selected for detailed energy analysis. A set of algorithms was developed to determine existing energy use. Following this, potential energy conservation opportunities (ECO's) were analyzed and refined. Energy savings, cost, and discounted payback were estimated for each ECO for all 95 projects, producing over 5,000 results. A method to organize the projects by significant categories of building type and climate was devised. Existing energy use was calculated, using standard algorithms such as those described in engineering manuals. After yearly energy consumption was calculated for each project and prototype, 58 ECO's were analyzed for each project. Based upon this analysis, graphs were produced to illustrate diminishing return of investment. In addition, a separate but coordinated solar analysis to assess potential solar retrofit in public housing was completed. Tables and illustrations are given.

20937 (SBI-R—121) SBI low energy house model 79 - with a 410 mm cavity brick wall. Blach, K.; Kjaer, B. (Research Establishment Risoe, Roskilde (Denmark)). 1980. 32p. (In Danish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE82901185.

The main aim of the project has been to develop a set of design details for cavity brick walls to be used in various low-rise house designs. As a full scale try-out a one-family house was built by a professional client in 1978. The house was sold, but according to prior agreement measurements of the energy consumption could be carried out through the first year of occupancy. In spite of the fact that the winter of 1978/79 was quite severe in Denmark, only about 6000 kWh were used for heating the house, which had an electric radiant heating system. The energy consumption is equivalent to 800 liters of fuel oil, if boiler efficiency is 75%. Electric heating was chosen in order to simplify the recording of energy consumption and distribution in the house. Other heating sources will also be possible. The house is an example of what can be achieved through so called passive energy conservation. The building envelope is highly insulated, cold bridges have been avoided as far as possible, and both walls, ceilings and joints have been made as airtight as possible. Airtightness of the walls has been obtained in a simple way by plastering and wall-papering the interior surfaces. The house is mechanically ventilated in order to avoid inconveniences because of the tightness of the building envelope. An air-to-air heat exchanger is connected to the ventilation system. Cost calculations have been carried out before the design details were approved. Both the house design and the various design details are modular. The Danish standard brick is not modular but can be used for modular brickwork. Also roof trusses, doors, windows, built-in-furniture, etc. are modular components.

20938 (SERI/TP—254-1807) Fourier-transform approach to building simulations with thermostatic controls. Subbarao, K.; Anderson, J.V. (Solar Energy Research Inst., Golden, CO (USA)). Dec 1982. 6p. (CONF-830405—15). NTIS (US Sales Only). Order Number DE83005299.

From 6. annual ASME technical conference on commercial building heating and cooling applications; Orlando, FL, USA (19 Apr 1983).

Analyzing the thermal behavior of a linear system, such as a building (with some commonly made approximations), is greatly simplified in the frequency domain because of the decoupling of different frequencies. Thermostatic controls, an important part of building systems, invalidate this decoupling since they respond only to the temperature at a particular time (i.e., the sum of all frequencies). Nevertheless it is shown here that by suitably formulating the problem, buildings with thermostatic controls can be simulated in the frequency domain, even when the setpoint is a function of time. Thus an hour-by-hour profile of indoor temperature and auxiliary energy requirements can be obtained without doing an hour-by-hour simulation.

20939 (PB—82-238262) Exhaust sensor for heating systems. Rohr, F.J.; Holick, H.; Minor, A.; Rentel, A. (Brown, Boveri und Cie A.G., Heidelberg (Germany, F.R.). Zentrales Forschungslabor). Jul 1982. Translation of Abgassonde fuer Heizungsanlagen, n.p., Oct 80. See also N81-31326.;. 95p. NTIS, PC A05/MF A01.

The development of an electrochemical exhaust sensor and a method for continuous measurement of the air-fuel ratio (AFR) of a burner is described. This ratio determines the efficiency and the contaminant emission of combustion processes. The AFR gauge consists of a zirconium oxide electrolyte sensor and auxiliary equipment for the stabilization of a gas flow and dosage of small gas quantities. Different oil and gas fueled burners were tested and the results demonstrate the proper functioning of the sensor. With its aid feedback optimization of the combustion process is possible. Improvements of burn efficiency of up to 10 percent are reported.

20940 (PB—82-217019) **Lakes as a heat source for residential heating: a survey of costs in comparison with different systems and ecological consequences.** Hellstrom, T. (Institutet foer Vatten- och Luftvaardsforskning, Stockholm (Sweden)). May 1982. Translation of Sjoar som Varmekalla for Bostadsuppvarmning-En overblick over kostnader i Jamforelse med olika system och ekologiska Konsekvenser, n.p., 31p, 4 Jun 80. See also N81-21594.;. 25p. NTIS, PC A02/MF A01.

The low grade energy in lakes and ground water can be used for residential heating by using heat pumps. An economic comparison of different systems was performed. It was assumed that the temperature of the produced hot water would be 60 C, and that the capacity would be 6500 MWh per year. The production costs were calculated but not the distribution costs. The ecologic consequences are discussed.

20941 (AD-A—116138/9) **Aircraft energy conservation during airport ground operations. Final report.** Bauchspies, J.S.; Costello, F.A.; Felder, J.; Hilliard, H.; Thompson, J.K. (ORI, Inc., Silver Spring, MD (USA)). Mar 1982. 313p. (ORI-TR—1974). NTIS, PC A14/MF A01.

This study identifies and assesses potential fuel conservation options which are available for use during ground operations at Dulles International (IAD) and Washington National (DCA) airports. The study also identifies and analyzes ground operations fuel savings options which have been considered and/or implemented by the various airlines operating at IAD and/or DCA since 1971. In addition, an evaluation of computer models which could be used for analyzing these fuel conservation options at other airports is included. The impact of socio/economic factors such as safety, environment, limitation on expansion and restrictions on accommodating forecast activity at DCA and IAD were considered during the analysis of each option.

20942 (AD-A—119953/8) **New York City Police Department Automated Fuel Monitoring system. Volume I. Overview. Technical report.** McGrath, W.J.; McNamara, M.M. (Naval Underwater Systems Center, New London, CT (USA). New London Lab.). 1 Oct 1981. 15p. NTIS, PC A02/MF A01.

The New York City Police Department (NYCPD) Automated Fuel Monitoring system is briefly described from the original study, through system design, to implementation. The system provides complete control of fuel usage for an agency with 4,000 motor vehicles and 25,000 vehicle operators. As far as is known, it is the largest system of its kind installed to date. The system can be scaled up or down to meet the needs of other governmental units. Estimated annual cost savings to NYCPD are $2,000,000.

20943 (AD-A—119954/6) **New York City Police Department Automated Fuel Monitoring system. Volume II. Documentation report. Technical report.** McGrath, W.J.; McNamara, M.M. (Naval Underwater Systems Center, New London, CT (USA). New London Lab.). 16 Nov 1981. 361p. NTIS, PC A16/MF A01.

The New York City Police Department (NYCPD) Automated Fuel Monitoring system is briefly described from the original study, through system design, to implementation. The system provides complete control of fuel usage for an agency with 4,000 motor vehicles and 25,000 vehicle operators. As far as is known, it is the largest system of its kind installed to date. The system can be scaled up or down to meet the needs of other governmental units. Estimated annual cost savings to NYCPD are $2,000,000.

20944 (CEMR-MS—5) **Fuel-conservation efforts of Texas municipal.** Crouch, B.M. (Texas A and M Univ., College Station (USA). Center for Energy and Mineral Resources). May 1982. 32p. NTIS, PC A03/MF A01. Order Number DE83901223.

Based on survey findings, several conclusions can be made about how Texas police departments perceive and react to high and rising fuel costs. Responses received from all departments indicated some programatic efforts to conserve fuel, which demonstrates that Texas police departments have dealt with and are concerned about the rising cost of fuel. However, the problem of meeting fuel bills was apparently not a paralyzing one in 1981. For example, only about one in five departments claimed that fuel costs were second only to salaries in their budgets. In addition, although some departments have been relying on the more popular conservation plans for years, the majority had instituted such plans within two or three years. Among the most frequently used programs, two clusters of program choices appear. The first cluster includes more frequent tune-ups, increased maintenance, and reminders to offiers to conserve fuel. The second cluster includes shutting-off engines at given intervals, regular use of fixed position patrol, and reminders to officers to conserve fuel.

20945 (CONF-820128—4) **Sketch planning model for urban transportation policy analysis.** Kaplan, M.P.; Gur, Y.; Vyas, A.D. (Argonne National Lab., IL (USA)). Jan 1982. Contract W-31-109-ENG-38. 12p. NTIS, PC A02/MF A01. Order Number DE83007606.

From 61. annual meeting of the Transportation Research Board; Washington, DC, USA (18 Jan 1982).

The Urban Transportation Policy Analysis Process (UTPAP) is described. UTPAP was developed as a sketch planning analysis tool for the Technology Assessment of Productive Conservation in Urban Transportation (TAPCUT). TAPCUT was a comprehensive study of the potential environmental, health, and public safety impacts of various alternative productive urban transportation energy conservation strategies. Productive conservation strategies encourage energy conservation without disrupting the economy or life-style. The strategies that were analyzed reflected alternative national investment in infrastructure and technology and regulatory policies. The UTPAP is a sketch planning model package that incorporates state-of-the-art, household based, disaggregate travel demand models for mode and destination choice with detailed specification of automobile technologies. It is useful in analyzing both the short and long term implications of city specific transportation planning policies, providing summaries of transportation, fuel consumption, air quality, and public health and safety impacts. Stratified by both type of household and geographic area of occurrence, these impact measures are valuable in assessing the social equity of transportation policy impacts. Preliminary sensitivity analysis indicated that non-work travel was more responsive to price and level-of-service (LOS) change than work travel.

20946 (CONF-820128—5) **Economic impacts of petroleum shortages and the implications for the freight-transportation industry.** Johnson, L.R.; Knorr, R.E.; Saricks, C.L.; Mendiratta, V.B. (Argonne National Lab., IL (USA)). Jan 1982. Contract W-31-109-ENG-38. 29p. NTIS, PC A03/MF A01. Order Number DE83007604.

From 61. annual meeting of the Transportation Research Board; Washington, DC, USA (18 Jan 1982).

The major economic impacts that result from petroleum-supply interruptions and the subsequent effects on the demand for freight transportation are described. This analysis involved a simulation of the effects of three different fuel-supply shortfalls on intercity freight transportation. The research included the use of three economic and transportation models to simulate the economic impacts of oil shortfalls and the resulting change in freight-transportation demand as expressed in tons shipped, ton-miles of travel, and fuel use. Economic effects are discussed for a base case and then for a 7%, 14%, and 23% petroleum shortfall. The demand for freight transportation is determined by the output of various commodity sectors which generate traffic for the truck, rail, water, air, and pipeline modes. The effects of various diesel-fuel-price levels are also examined. The analysis suggests that at low, or controlled, fuel prices the more significant impacts for freight movements will be the reduction in output in the bulk-commodity sectors, which are dominated by the waterway and rail modes. At high fuel prices (i.e., equilibrium levels), shipping is significantly decreased in all commodity sectors, but mode shifts are likely to occur from truck to rail, and even from rail to water in some corridors.

20947 **(CONF-820128—6) Energy-conservation strategies and their effects on travel demand.** Stuart, D.G.; LaBelle, S.J.; Kaplan, M.P.; Johnson, L.R. (Barton-Aschman Associates, Inc., Evanston, IL (USA)). Jan 1982. Contract W-31-109-ENG-38. 32p. NTIS, PC A03/MF A01. Order Number DE83007630.

From 61. annual meeting of the Transportation Research Board; Washington, DC, USA (18 Jan 1982).

The types of impact on urban travel demand which might be expected from two broad, multi-faceted energy-conservation strategies are described. Based on sketch planning travel demand modeling conducted for three case-study regions, and generalized extrapolation of these results to national totals, illustrative travel impact results are presented. Five different types of impact are considered: (1) mode choice by trip purpose (work vs. non-work); (2) variations in transit travel by city type; (3) vehicle miles of automobile travel, for work and non-work purposes; (4) variations in trips per capita and trip length, by purpose; and (5) distributional differences in terms of household income levels and location within urban areas (central city, suburban, exurban). The In-Place Policy, marked by a sharp rise in auto out-of-pocket costs, showed no increase in per capita auto travel by 2000, while lowering aggregate energy consumption. The Individual Travel Policy, which lowered auto operation cost relative to In-Place by improvements to auto fuel economy achieved noticeable energy savings with negligible impact on choice of travel mode. The Group Travel Policy, on the other hand, significantly altered mode choice and saved transportation energy in this way. Significant improvements in transit service and strong automobile travel disincentives yielded dramatic shifts to group travel modes for non-work travel. Work travel mode choice was affected to a lesser extent, with increases of 30 to 40% in transit and shared ride mode splits.

20948 **(MIRA—82/12) Motor vehicle energy usage: a literature survey up to the end of 1974.** Shields, M.J.; Robinson, M.S. (Motor Industry Research Association, Nuneaton (UK)). May 1978. 24p. NTIS PC$9.00.

In order to estimate potential automotive energy savings, a literature survey, together with some elementary analysis of data, was carried out. Despite the necessarily restricted nature of the survey and analysis, and some inconsistencies in published data, it is possible to predict that not less than 85% of all potential energy savings will be made through reductions in vehicle fuel consumption, and the cash savings to the national economy resulting from this reduction in automotive energy demand will be of the order of 100M pounds per annum.

20949 **(N—82-25181) Sideslip indication system as a fuel saving aid in jet transport aircraFt operation.** Horst, D. (Lufthansa G.m.b.H., Hamburg (Germany, F.R.)). Nov 1981. 29p. NTIS, PC A20/MF A01.

In DFVLR Proc. of the 11th Symp. on Aircraft Integrated Data Systems p 247-275 (SEE N82-25171 16-01).

The relationship between sideslip angle heading constant, and roll angle is outlined and a sideslip sensor is described. A conical pressure sensing probe extends through the fuselage perpendicular to the local air flow. Unequal pressure arising from sideslip causes two paddle blades to rotate the probe until pressure on each paddle is equal, i.e., until the probe is realigned with the airstream. During rotation, output elements attached to the probe are also rotated, providing electrical signals proportional to sideslip angle to an indicator. Tests on an A-300 Airbus show that avoiding sideslip cuts fuel consumption by 0.2%.

20950 **(N—8228341) Electric propulsion.** (Jet Propulsion Lab., Pasadena, CA (USA)). Feb 1982. 7p. NTIS, PC A18/MF A01.

An alternative propulsion subsystem for MSAT is presented which has a potential of reducing the satellite weight by more than 15%. The characteristics of pulsed plasma and ion engines are described and used to estimate of the mass of the propellant and thrusters for attitude control and stationkeeping functions for MSAT. Preliminary estimates indicate that the electric propulsion systems could also replace the large momentum wheels necessary to counteract the solar pressure. However, the fine pointing wheels would be retained. Estimates also show that either electric propulsion system can save approximately 18% to 20% of the initial 4,000 kg mass. The issues that require further experimentation are mentioned.

20951 **(NASA-CR—3220) Selected advanced aerodynamic and active control concepts development.** (Boeing Co., Seattle, WA (USA)). Jan 1980. 56p. NTIS, PC A04/MF A01.

NASA REFS.

A summary is presented of results obtained during analysis, design and test activities on six selected technical tasks directed at exploratory improvement of fuel efficiency for new and derivative transports. The work included investigations into the potential offered by natural laminar flow, improved surface coatings and advanced high lift concepts. Similar investigations covering optimum low-energy flight path control, integrated application of active controls and evaluation of primary flight control systems reliability and maintenance are also summarized. Recommendations are included for future work needed to exploit potential advancements.

20952 **(NASA-CR—159097) Accelerated development and flight evaluation of active controls concepts for subsonic transport aircraft. Volume 1: load alleviation/extended span development and flight tests. Final report.** Johnston, J.F. (Lockheed-California Co., Burbank (USA)). Sep 1979. 261p. NTIS, PC A12/MF A01.

Active wing load alleviation to extend the wing span by 5.8 percent, giving a 3 percent reduction in cruise drag is covered. The active wing load alleviation used symmetric motions of the outboard ailerons for maneuver load control (MLC) and elastic mode suppression (EMS), and stabilizer motions for gust load alleviation (GLA). Slow maneuvers verified the MLC, and open and closed-loop flight frequency response tests verified the aircraft dynamic response to symmetric aileron and stabilizer drives as well as the active system performance. Flight tests in turbulence verified the effectiveness of the active controls in reducing gust-induced wing loads. It is concluded that active wing load alleviation/extended span is proven in the L-1011 and is ready for application to airline service it is a very practical way to obtain the increased efficiency of a higher aspect ratio wing with minimum structural impact.

20953 **(NASA-Facts—94/8-81) Aerodynamics/ACEE: aircraft energy efficiency.** (National Aeronautics and Space Administration, Washington, DC (USA)). 1981. 8p. NTIS, PC A02/MF A01.

An overview is presented of a 10 year program managed by NASA which seeks to make possible the most efficient use of energy for aircraft propulsion and lift as well as provide a technology that can be used by U.S. manufacturers of air transports and engines. Supercritical wings, winglets, vortex drag reduction, high lift, active control, laminar flow control, and aerodynamics by computer are among the topics discussed. Wind tunnel models in flight verification of advanced technology, and the design, construction and testing of various aircraft structures are also described.

20954 **(NP—3901121) Preparing for possible motor-fuel shortages: a community planning guide, Grants, New Mexico.** (New Mexico Energy and Minerals Dept., Santa Fe (USA); New Mexico State Highway Dept., Santa Fe (USA)). Feb 1982. 106p. New Mexico Energy R & D Information Center, 117 Richmond Dr., NE, Albuquerque, NM 87106.

A practical approach is provided for the community of Grants, New Mexico, to respond to motor fuel supply disruptions. The following are included: overviews highlighting fuel supplies and government roles in emergency transportation planning; factors in contingency planning which include community profiles, needs, resources, and constraints; and the local emergency planning process. (MHR)

20955 **(NP—3901210) Preparing for possible motor-fuel shortages: a community planning guide, Taos, New Mexico.** (New Mexico Energy and Minerals Dept., Santa Fe (USA); New Mexico State Highway Dept., Santa Fe (USA)). Feb 1982. 104p. New Mexico Energy R & D Information Center, 117 Richmond Dr., NE, Albuquerque, NM 87106.

This guide is prepared to provide a practical approach for the community of Taos, New Mexico, to respond to fuel supply disruptions. The following are included: overviews highlighting fuel supplies and government roles in emergency transportation planning; factors in contingency planning which include community profiles, needs, resources, and constraints; and the local emergency planning process. (MHR)

20956 **(PB—82-253329) Energy consumption of an electric, a petrol and a diesel powered light goods vehicle in central london traffic. Final report for 1978.** Wood, R.A.; Downing, B.R.; Pearce, T.C. (Transport and Road Research Lab., Crowthorne (UK)). [nd]. 49p. NTIS, PC A03/MF A01.

The consumption of primary energy by diesel, petrol and electric versions of a light van was compared under high-density urban traffic conditions. The vehicles were driven repeatedly round a 10km route in Central London and measurements of fuel consumption, distance travelled and time were made for each route section. Multiple regression analysis established vehicle sensitivities to variations in average speed, payload, road type, regenerated energy (electric vehicle), kinetic energy, weather and driver. The diesel vehicle used primary energy more efficiently than either the petrol or the electric vehicle over the entire speed range observed, the ratio of energy consumption (diesel:petrol:electric) being 100:185:198 at the average speed during the experiment (17.58km/h). The petrol vehicle was more efficient than the electric over most of the speed range, but was less efficient at speeds below about 14km/h. It is concluded that the diesel vehicle is the most efficient for urban delivery duties.

20957 **(PB—82-255647) Power and energy measurement on Morgantown People Mover system. Final report Jul 80-Nov 81.** McConnell, R.L.; Kuniak, R.J. (West Virginia Univ., Morgantown (USA). Harley O. Staggers National Transportation Center). Dec 1981. 97p. NTIS, PC A05/MF A01.

The Morgantown People Mover (MPM) is one of the most technologically advanced automated ground transportation systems in the world. It is a fully automated guideway transit (AGT) system under complete computer control. There are 8.7 miles of single lane guideway with five passenger stations and two maintenance stations. The vehicles are powered from a 575 volt three phase power rail that runs immediately above the guide rail throughout the system. The overall objectives of this study were the measurement of the power to determine real time power demand by the vehicle; and the development of a load flow analysis on the power system with several vehicles operating. This study developed a system of measuring and recording power demand on the MPM system. Vehicle power demand profiles are presented for some sections of the guideway.

20958 **(PB—83-115378) Energy cost reduction study of the Washington Metropolitan Area Transit Authority metrorail system. volume 1: final report.** Uher, R.A.; Sathi, N.; Sathi, A. (Carnegie-Mellon Univ., Pittsburgh, PA (USA). Rail Systems Center). May 1982. 202p. NTIS, PC A10/MF A01.

The Washington Metropolitan Area Transit Authority (WMATA) has established a program for reducing its overall energy costs. The objectives of this two-volume study were to classify the energy used by Metrorail into its primary end uses, and to identify those energy conservation strategies that have the highest potential for reducing energy costs. Although support energy (energy used in passenger stations, office buildings, and maintenance shops) is considered in this investigation, the primary emphasis is on traction energy (running the trains in revenue operation). The study involved analyzing the present energy costs, developing cost-effective energy conservation strategies, simulating the energy cost savings associated with these strategies, recommending the appropriate strategies for implementation and outlining a program for executing the recommendations.

20959 **(PB—83-115386) Energy cost reduction study of the Washington Metropolitan Area Transit Authority metrorail system. volume 2: appendices. Final report.** Uher, R.A.; Sathi, N.; Sathi, A. (Carnegie-Mellon Univ., Pittsburgh, PA (USA). Rail Systems Center). May 1982. 268p. NTIS, PC A12/MF A01.

This study is the first time that the Energy Management Model (EMM), developed for the transit industry by the Rail Systems Center at Carnegie-Mellon University, was comprehensively applied to a rapid transit property. The application to Metrorail was verified by comparing the simulated results to actual data obtained from the Potomac Electric Power Company (PEPCO). The simulated results agree to within 3 percent of the actual energy consumption. Five energy conservation strategies were recommended for implementation based on high benefit and low cost, namely: coasting, catch-up operation, passenger load factor improvement, regeneration of braking energy, and passenger station lighting improvements.

20960 **(TVA/PUB—83/25) Transportation methods and costs for sawlogs, pulpwood bolts, and longwood.** (Tennessee Valley Authority, Norris (USA). Div. of Land and Forest Resources). Feb 1981. 39p. NTIS, PC A03/MF A01. Order Number DE83901164.

Travel speeds, average load volumes, and costs per mile were determined for 15 different trucking methods. Equations were developed to predict rail and barge transportation costs. Several photographs are provided for user association and correlation with the study results.

20961 **(ANL—83-8) Fluidelastic instability in shell and tube heat exchangers: a framework for a prediction method.** Wambsganss, M.W.; Yang, C.I.; Halle, J. (Argonne National Lab., IL (USA)). Dec 1982. Contract W-31-109-ENG-38. 55p. NTIS, PC A04/MF A01. Order Number DE83007812.

A framework for a method to predict fluidelastic instability in heat exchanger tube bundles is presented. The method relies on a three-dimensional, cylindrical coordinate, thermal-hydraulic analysis code to obtain a representation of the three-dimensional flow distribution within the heat exchanger. With this information, local crossflow velocities corresponding to each tube in the exchanger are obtained by interpolation and resultant crossflow velocity distributions are computed. With a knowledge of the vibration mode shapes and frequencies, reduced effective crossflow velocities are then computed for each tube. A comparison with experimental results shows excellent agreement: the tubes with high values of predicted reduced effective crossflow velocity are the same tubes that first experience fluidelastic instability in the flow tests and vibrate most violently; also, the simulation correctly predicts that the tubes directly exposed to the flow from the inlet nozzle have a low potential for fluidelastic instability. Very good agreement is also shown in the comparison of the predicted reduced effective crossflow velocities with the critical value obtained from a design guide. In summary, the feasibility of developing a heat exchanger tube vibration prediction method, based on a computer simulation of flow distribution, is demonstrated. Such a method would have immediate application in design optimization. However, further development and evaluation are required.

20962 **(ANL/ENG—82-01) Conceptual study: potential energy savings based on reduction of pressure in the ANL-east central heating system.** Minkov, V.; Hirsch, P. (Argonne National Lab., IL (USA)). Sep 1982. Contract W-31-109-ENG-38. 250p. NTIS, PC A11/MF A01. Order Number DE83007984.

Retrofitting existing Central Heating Systems to deliver steam at lower pressure and where necessary retrofitting end users to perform satisfactorily at the lower pressure, is examined in terms of engineering approaches and economic effectiveness. In addition to investigating the savings obtainable through reduction of thermal and leakage losses, other energy conservation opportunities related to reduction of steam pressure are considered. The latter includes less boiler blowdown, less energy used pumping feedwater, less steam vented from the deaerator, reduced boiler maintenance and repair requirements, and cogeneration of electricity by steam or gas turbines. Methodology and practical recommendations are presented that, although related directly to Argonne, are applicable to other facilities. Energy savings are estimated as up to 10%, and payback period as in the range of two to four years.

20963 (ANL/NESC—854) TDIST3; community energy consumption analysis. Ebeling-Koning, D.B.; Golay, M.W. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Nuclear Engineering). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048854.

Maxima of - 20 different building types 10 energy sources in the piping network 75 energy consumer groups. The piping network is restricted to parallel, counter-current flow supply, and equal diameter pipes.

The TDIST3 program performs an analysis of large integrated community total energy systems (TES) supplying thermal and electrical energy from one or more power stations. The program models the time-dependent energy demands of a group of representative building types, distributes the thermal demands within a thermal utility system (TUS), simulates the dynamic response of a group of power stations in meeting the TUS demands, and designs an optimal base-loaded (electrically) power plant and thermal energy storage reservoir combination. The capital cost of the TES is evaluated, also. The program was developed primarily to analyze thermal utility systems supplied with high temperature water (HTW) from more than one power plant. The TUS consists of a transmission loop and secondary loops with a heat exchanger linking each secondary loop to the transmission loop. The power stations electrical output supplies all community buildings and the HTW supplies the thermal demand of the buildings connected through the TUS, a piping network. Basic components of the TES model are one or more power stations connected to the transmission loop. These may be dual-purpose, producing electricity and HTW, or just heating plants producing HTW. A thermal storage reservoir is located at one power station. The secondary loops may have heating plants connected to them. The transmission loop delivers HTW to local districts; the secondary loops deliver the energy to the individual buildings in a district.IBM370; FORTRAN IV (G-level compiler); OS/370 MVT, Release 21.7; 280K bytes of memory, card-image input and printer output units.

20964 (CONF-810940—12) Application of thermal energy storage to process heat recovery, Phase III, heat exchanger evaluation. Katter, L.B. (Rocket Research Co., Redmond, WA (USA)). 1981. Contract W-7405-ENG-26. 5p. NTIS, PC A02/MF A01. Order Number DE82000166.

From Annual contractors' review meeting on thermal and chemical storage; Tysons Corner, VA, USA (16 Sep 1981).

The overall goals of the Phase III Heat Exchanger Evaluation are to develop data which will enable the design of a heat exchanger suitable for long-term continuous operation in the aluminum plant pollution control system environment and to assure that the installation of such a device will have no negative impact upon the existing processes. This heat exchanger's function is to recover reject process heat which can be stored and ultimately used as the heat source in a district heating system. A series of tests starting with small-scale experiments and expanding in magnitude to a production prototype is currently in process. The smallest scale testing is complete. Information gathered has been used to define a subscale heat exchanger. The subscale heat exchanger is currently being fabricated. Preparations for its installation are underway currently.

20965 (CONF-8204112—1) New concepts in hardware and processes to conserve oil and gas in industrial processes. Humphrey, J.L. (Argonne National Lab., IL (USA)). 5 Apr 1982. Contract W-31-109-ENG-38. 9p. NTIS (US Sales Only). Order Number DE83007716.

From 4. annual industrial energy conservation technology conference; Houston, TX, USA (6 Apr 1982).

A broad program to identify and evaluate new types of hardware and processes to conserve oil and gas in chemical plants and petroleum refineries has been completed. During this program, Argonne interacted with 130 industrial companies to help define and evaluate appropriate areas of technology. The initial step was to assemble a master list of technologies that promised to conserve oil and gas. These technologies were then screened on the basis of quantity of energy saved, capital and operating costs, industry attitude, market potential, and special barriers to implementation such as environmental issues and other special types of problems. One approach used to determine industry attitudes on technologies was to poll several key energy-conservation groups. These included the Gulf Coast Energy Society, Golden Triangle Energy Society, CMA Energy Committee, and the Energy Conservation Committee of the American Petroleum Institute. Some of the results of this program are summarized in terms of the following areas of technology: energy-efficient methods of separation, alternative fuels and feedstocks, recovery of low-level heat, and advanced concepts.

20966 (DOE/CS/40094—T1) Energy conservation in the poultry processing industry. Phase I. Final report, June 1977-July 1978. Combes, R.S. (Georgia Inst. of Tech., Atlanta (USA). Engineering Experiment Station). Sep 1978. Contract AS05-77CS40094. 83p. (CONS—5459-1). NTIS, PC A05/MF A01. Order Number DE83007494.

This research project, constitutes the first phase of a two-phase program to identify and demonstrate energy conservation opportunities in the US poultry processing industry. The Gold Kist, Inc. broiler processing plant located in Ellijay, Georgia was chosen as the demonstration plant, and the first phase research addresses the characterization and engineering analyses of energy consumption patterns at this plant; identification of energy conserving plant modifications; and design and economic analysis of the modifications for actual implementation at the plant.

20967 (DOE/CS/40094—T2) Energy conservation in the poultry-processing industry. Final report-processing industry. Combes, R.S.; Boykin, W.B. (Georgia Inst. of Tech., Atlanta (USA). Engineering Experiment Station). Mar 1980. Contract AS05-77CS40094. 180p. NTIS, PC A09/MF A01. Order Number DE83901504.

A research project was conducted to identify and demonstrate technology to reduce the quantity of energy required in processing poultry. Readily available industrial energy-conserving equipment components were installed in an operating plant. When combined with modified operational procedures, these systems improved plant energy efficiency by 10.5% during 1979 while operating less than the full year. The energy-conserving systems installed showed simple paybacks ranging from less than one to a maximum of seven years and, if operated year-round, can result in a 30% plant energy savings.

20968 (DOE/ET/13332—T2) Potential for industrial cogeneration development by 1990. Executive summary. (Resource Planning Associates, Inc., Cambridge, MA (USA)). 31 Jul 1981. Contract AT03-76ET13332. 37p. NTIS, PC A03/MF A01. Order Number DE83008422.

The study reported was to determine how much industrial cogeneration development would occur in the 1980s. The study focused on electrical cogeneration in five industries that constitute three-quarters of industrial steam demand - pulp and paper, chemicals, petroleum refining, steel, and food processing. Several different industrial cogenertion investment situations were considered. Only steam topping-cycle applications are considered. Further, the effect of utility and industry ownership on cogeneration development is considered. The estimated cogeneration investment under a base-case condition of no additional governmental action is described, and the additional investment resulting from selected new governmental actions to remove regulatory barriers are examined. (LEW)

20969 (DOE/ID/12162—T2) Co-fired oil and tire-derived fuel: waste-tire energy-reclamation project. (Eastern Products Corp., Andover, MA (USA)). Apr 1982. Contract FC07-80ID12162. 146p. NTIS, PC A07/MF A01. Order Number DE83007300.

Test results demonstrated that tire-derived fuel (TDF) can be co-fired with oil in a concentration of up to 16% of the Btu input to the boiler. Combustion efficiency was aproximately the same as when burning oil only. This efficiency was achieved without making any inlet air optimization adjustments. The data also showed that TFD could be co-fired with oil without air pollution equipment and met Massachusetts pollution standards with proper control of the underfired air supply. Problems with the feed system and the grate are discussed. (MHR)

20970 (DOE/ID/12163—T1) National-Standard Company waste-tire fluidized-bed-combustion boiler project. Final report. Kenney, R.; Joyce, J.F. (National-Standard Co., Niles, MI (USA)). 1981. Contract FC07-80ID12163. 324p. NTIS, PC A14/MF A01. Order Number DE83008108.

The objective of the work reported was to commercially demonstrate a fluidized bed combustion (F.B.C.) system that could convert waste tires into steam energy at a convenience level approximately that of oil or gas-fired boilers. In order to burn tires in a F.B.C. unit, the tires must first be chopped into a maximum size of four inches by four inches. A test program was conducted to determine performance and design criteria, which were used to specify a commercial scale steam generation demonstration unit. It was found that 100% of the heat of combustion available in tires can be released in a F.B.C. unit. Tires must be combusted at 775 +- 25°C to provide for fiberglass removal. Unburned carbon black along with fiberglass, zinc oxide, bed fines and scrap wire would have to be landfilled. Sulfur dioxide and nitrogen oxide emissions would be below the limits imposed by the Michigan Department of Natural Resources. Particulate emissions downstream of the cyclone would have to be limited by some system such as a bag house. A revised financial analysis showed that the investment required for the F.B.C. unit made the entire system uneconomical. Although the operating costs of the waste tire system was considerably less than that of gas or oil fired boilers, the large initial investment for the system made the payback period 12-18 years.

20971 (DOE/JPL—9950-691) Membrane separation technology in the 1980's. ECUT: Energy Conversion and Utilization Technology Program. Biocatalysis research activity. Final report. Lonsdale, H.K. (Bend Research, Inc., OR (USA)). Mar 1982. Contract AI01-81CS66001. 45p. NTIS, PC A03/MF A01. Order Number DE83007264.

The status of membrane technology is described, as well as directions of membrane research and development around the world. It is concluded that the greatest promise for future applications lies in the extension of current trends, i.e., the development of ultrathin and highly permselective membranes; the use of specific carriers to enhance permselectivity, and, under certain conditions, permit uphill diffusion; and the use of new engineering approaches to improve separation efficiency. An important role is also anticipated in the evolving biotechnology field and in solar energy conversion. Areas are cited where research in membrane processes is considered likely to provide a positive return. (LEW)

20972 (EUR—7621-DE) Energy revovery from waste, with special regard to the possibility of producing high-grade granulated insulating materials by swelling processes. Neumann, P. (Commission of the European Communities, Luxembourg). 1981. 93p. (In German). Available from the Commission of the European Communities, Luxembourg.

How far the energy contained in residues can be recovered and used for producing light ceramized fluxes is discussed. Raw materials considered are a) industrial waste, household refuse, sewage sludge, and municipal waste, b) tailings, washery dirt, and flotation waste, and c) various types of fly dust, mostly from collieries.

20973 (EUR—7657-EN) Design, construction and testing of a gas engine driven high temperature industrial heat pump. Kew, P.A. (Commission of the European Communities, Luxembourg). 1982. 53p. Available from Commission of the European Communities, Luxembourg.

A high temperature, gas engine-driven heat pump has been designed constructed and commissioned. Most components are commercially available, the main exception being the exhaust boiler. The other heat exchangers were custom designed. When a source of hot water at 80°C is available the system can produce saturated steam at 110°C in the heat pump condenser, the engine jacket and the exhaust boiler. The Primary Energy Ratio (PER) of the system operating at design condition is 1.50 and the heat pump is capable of delivering 333 kW to the sink while consuming 221 kW of gas; a performance closely corresponding to the design specification. Preliminary tests indicate that the lubricant and R114 are compatible in contact with the compressor, pipework and heat exchanger materials at the temperatures encountered in the heat pump. Longterm tests are necessary to confirm this.

20974 (NP—3901021) Heat pumps for air conditioning in animal shelters and for heating of buildings. Balg, J. (Bonn Univ. (Germany, F.R.). Landwirtschaftliche Fakultaet). 14 May 1980. 168p. (In German). NTIS (US Sales Only), PC A08/MF A01. Order Number DE83901021.

Thesis.

This paper investigates the possibilities of economical application of heat pumps to improve the shelter climate and to utilize the animals heat potential for the purpose of heating. In order to be able to take the various influencing factors into consideration and to assess them economically, a calculation model was developed which allows, by using EDP, to understand the various influencing factors importance simultaneously. The basis are functional relations between environment and the usefulness and the heating capacity of the animal which were taken from the relevant literature. Animals referred to in the investigation are fattened cattle, fattened pigs, and broilers. In order to optimize the monetary usefulness of the fattening the fodder utilization by the animals should be selected as a criterion of the efficiency of fattening.

20975 (PB—82-227596) An assessment of vapor compression heat pump technology and applications for industrial processes. Final report Nov 80-Feb 82. Kearney, D.W. (Insights West, Inc., Los Angeles, CA (USA)). Apr 1982. 228p. NTIS, PC A11/MF A01.

The current status and potential of vapor compression heat pump technology and applications for industry are assessed, with particular regard to the impact of this technology on natural gas utilization. Industrial applications were identified on a 4-digit SIC level for each of the generic types of closed and open cycle VCHP systems: temperature boosting, dehumidification, mechanical vapor recompression, and low pressure steam production.

20976 (PB—82-229014) Recovery of heat from exhaust air of spray driers in the dairy industry. Summary report (final). Jansen, A.; Steenbergen, A.E.; Bergers, W.W.A. (Commission of the European Communities, Luxembourg). [nd]. 100p. NTIS, PC AE05/MF E05.

Experiments are described in which low cost aluminum heat exchangers (finned heat-pipe and plate types) transfer heat from the exhaust to incoming fresh air. After 24 hours' operation, flow resistance was found to increase and efficiency to fall due to fouling of the exchangers by milk powder. The effects of powder and moisture concentrations on the extent of this fouling are investigated. The ease of cleaning accumulated milk powder from the two types of heat exchanger for reasons of hygiene and their thermodynamic performance in the drying plant are compared. Cost and energy assessments are presented.

20977 (PB—82-229741) Substituting power plant waste heat for on-farm heat requirements. Final report. Lomax, K.M.; Gray, R.J. (Delaware Univ., Newark (USA)). Mar 1982. 85p. NTIS, PC A05/MF A01.

This report presents an analysis of the use of waste heat in the form of warm water (40C) from electric generating stations as an economical energy supply for drying grain. The power plants in Maryland were compared for available grain production and the Vienna site was found to provide the largest potential supply of grain. A computer model (MAIN. FOR) was designed to evaluate waste heat as an energy source based on the amount of energy required for drying, the supply of energy available from waste heat, and the amount of travel permitted by substitution of the waste heat for the usual propane fuel.

20978 (PB—82-230731) Etude des possibilites de recuperation des chaleurs perdues dans les installations thermiques: application aux cokeries classiques (study of ways of recovering waste heat from heat consuming installations: applications to traditional coke ovens). Final report. Busso, R.H.; Tribodet, P. (Commission of the European Communities, Luxembourg). [nd]. 82p. NTIS, PC AE05/MF E05.

A scheme is put forward for recovering more than 10% of the energy consumed by the coking process (500 MJ or 140 kWh per ton of coke produced) for the production of superheated steam. Laboratory and industrial tests were undertaken to identify the factors involved in the study and in the design of heat exchangers for the following alternatives: the case of a pilot heat exchanger, installed at the discharge of a coke oven for verifying on a semi-industrial scale the relevant hypotheses; the case of a single full-scale industrial heat exchanger for a large battery of ovens and whose economics appear to be favorable.

20979 (PB—82-232513) Test evaluation of gasoline transfer vapor recovery systems. Hasselmann, D.E. (TRW, Inc., Redondo Beach, CA (USA)). Nov 1974. 243p. NTIS, PC A11/MF A01.

This report describes the results from tests of systems for collecting hydrocarbon vapors at automobile filling stations. The purpose of these tests was to develop test procedures for determining gasoline vapor emissions during transfer operations at service stations and to use these methods to evaluate five different vapor recovery systems. Two balanced and three secondary vapor recovery systems were tested.

20980 (PB—82-251976) Conversion of shale and slate wastes to glass and glass-ceramic products. Open file report 20 Oct 76-19 Sep 79. MacKenzie, J.D. (California Univ., Los Angeles (USA)). 20 Oct 1980. 33p. NTIS, PC A03/MF A01.

Experiments were conducted to convert spent oil shale, waste slate, and copper slag into glass and glass-ceramic products. Spent oil shale was easily melted at 1,300C and converted into glass wool for insulation application. Glass-ceramics were prepared by the use of domestic chrome ore as a nucleating agent. Waste slate from Vermont was readily melted when mixed with limestone. The resultant glass fibers were highly resistant to alkali attack. Iron metal was recovered from copper slags by the use of coal powder as a reducing agent in the molten slag. The lowering of the iron content resulted ina melt that was glass-forming. Combinations of spent oil shale and copper slag also yielded useful glass and glass ceramic compositions.

20981 (PB—82-252016) Development of substitutes for asbestos. Open file report 28 Sep 79-1 Apr 81. MacKenzie, J.D. (California Univ., Los Angeles (USA)). Nov 1981. 29p. NTIS, PC A03/MF A01.

Experiments were conducted to determine the feasibility of using waste slate and limestone as a substitute for asbestos when producing glass powders and fibers. Glasses were made from mixtures of Vermont slate and limestone. The alkali resistance of the glass powders and the glass fibers was superior to that of glass powders and glass fibers based on compositions containing large amounts of zirconia. Some of the present glass compositions have alkali-resistance almost as good as that of chrysotile asbestos. Because of the low cost, ready availability in the United States, low melting temperatures, and ease of rendering into glass fibers, waste slate and limestone can be considered as substitutes for asbestos for many cement-type applications.

20982 (PB—82-259631) Highway binder materials from cellulosic and related wastes. Final report. Butte, W.A.; Kohn, E.M.; Scheibel, E.G. (Suntech, Inc., Marcus Hook, PA (USA)). Dec 1980. 169p. NTIS, PC A08/MF A01.

The abundance of cellulosic-based wastes was reviewed by section of the country and type which includes: wood wastes, municipal wastes and manures. Of the most promising waste conversion processes now under consideration, pyrolysis, liquefaction, and hydrolysis were selected for preliminary laboratory screening. Model wastes for this study included several pyrolysis oils, paper, sawdust and dried cow manure. Distillate oils produced during wood waste pyrolysis (WPO) served best as precursors of products that approximated bitumens and highly viscous fluids.

20983 (PB—82-262783) Refractory properties of brick produced from beneficiated chrome-containing furnace linings. Report of investigations/1982. Petty, A.V. Jr. (Bureau of Mines, Tuscaloosa, AL (USA). Tuscaloosa Research Center). Jul 1982. 22p. NTIS, PC A02/MF A01.

In Bureau of Mines research on recycling chrome-containing refractory wastes, used refractories from argon-oxygen decarburization and electric steelmaking furnaces were beneficiated. By means of dry magnetic separation on minus 6-mesh crushed wastes, a concentrate was produced. After minor adjustments to the particle size distribution, full-size refractory brick were dry-pressed by a commercial producer and fired to 1,450 and 1,730C. Standard testing procedures were used to determine the cold-crushing strength, modulus of rupture at 25, 1,300, and 1,500C, hot load, thermal shock resistance, thermal expansion, and slag resistance. Optical and electron microscopy were used to determine grain-bonding mechanisms, and energy dispersive analysis of X-rays was used to determine elemental distribution. The test results indicate that the beneficiated material could be used to produce a refractory product suitable for moderate-temperature applications.

20984 (PB—83-108605) Development and demonstration of a reverse-osmosis energy-recovery device. Final report. Andeen, G.B.; Eid, J.C. (SRI International, Menlo Park, CA (USA)). Jun 1982. 44p. NTIS, PC A03/MF A01.

An energy-recovery device for a seawater reverse-osmosis (RO) system was designed, fabricated, and tested. The device, comprised of a valving system, uses waste streams from an RO system to drive a pump which, in turn, sends additional feed flows to the RO elements. Test data demonstrated that efficiencies exceeding 95% can be expected, and, hence, energy consumption in a seawater RO desalination system can be decreased by 50%. Further, conversion may be decreased from 30% in order that membrane life is extended, and the size of the main pump and prime mover can be reduced by 50%. The device was subjected to almost 1000 hours (175,000 cycles) of testing, simulating its operation in a 4800 gallon/day seawater system, producing an outlet pressure of over 850 lbs/sq-in. for an inlet pressure of 750 lbs/sq-in. The device demonstrated an ability to self-start and to be controlled. An analysis of value and costs suggested that the device would be available to systems as small as 10,000 gallons/day. The results of this work confirm that significant improvements in the energy and economic performance of seawater desalination systems can be achieved.

20985 (PB—83-110734) Technological response to environmental protection regulations and energy price/supply structure: a case study of chlorine/caustic soda manufacturing. Executive summary report 1 Jul 79-30 Jun 81. Iverstine, J.C.; Kinard, J.L.; Cudd, R.M. (Southeastern Louisiana Univ., Hammond (USA). Coll. of Business). Nov 1981. 21p. NTIS, PC A02/MF A01.

A study to assess the technological response of chlorine/caustic soda manufacturers to environment regulations and energy constraints is summarized. In order to pinpoint specific technological innovations in chlorine manufacturing resulting from energy and environmental issues, all aspects of the manufacturing process were investigated. In addition, information was compiled on production rates, energy sources, electricity price and consumption patterns, and other pertinent data. These data were gathered via personal interviews with corporate officials representing 92 percent of the total U.S. chlorine/caustic soda manufacturers. Equipment vendors were interviewed to obtain performance data, and secondary data were gathered from trade journals, trade associations, and the Chlorine Institute. An overview of the technology and a review of relevant research hypotheses with conclusions are presented. A comparison of three alternative technologies using the best demonstrated efficiencies indicates that excellent energy savings are currently available by adopting membrane cell technology in lieu of the use of mercury or diaphragm cells. From both environmental and energy perspectives, it was suggested that membrane technology should be considered strongly in capacity planning. Reviewer comments are appended to the final report.

20986 **(PB—83-111286) Introduction of sulfur into copper converter slags to produce copper matte. Report of investigations/1982.** Paige, J.I.; Anable, W.E. (Bureau of Mines, Albany, OR (USA). Albany Research Center). Aug 1982. 22p. NTIS, PC A02/MF A01.

The Bureau of Mines investigated a method to totally utilize copper converter slags without recycling them back through the matte smelting furnace. The research was directed toward (1) recovering the contained copper in converting slags by producing a recyclable copper-iron matte, (2) carbothermically reducing the slags to recover the iron, and (3) producing slag wool from the depleted slags. This report deals with the reduction of three industrial converting slags, containing 2.0 to 7.3 wt-pct Cu, in an 800-kVA electric arc furnace to produce a recyclable copper-iron matte.

20987 **(PB—83-117358) Evaluation of asphalt cement extraction and recovery methods. Final report Oct 80-Jun 82.** Carey, D.E.; Paul, H.R. (Louisiana Dept. of Transportation and Development, Baton Rouge (USA). Research and Development Section). Jul 1982. 53p. NTIS, PC A04/MF A01.

The quality of recovered asphalt cement is studied which may be attributable to the method used for extraction or to the Abson recovery. Variables of these procedures such as the time an asphalt cement was exposed to extraction solvent, the total quantity of asphalt cement recovered, the total quantity of extraction solvent, and both the type and quantity of fines in the extracted mix samples were isolated to determine their influence on tested asphalt cement properties. Also examined was the testing variation within one operator and between two operators.

20988 **(PNL—4499) Survey and analysis of federally developed technology.** Reed, J.E.; Conrad, J.L. (Energetics, Inc., Columbia, MD (USA)). Feb 1983. Contract AC06-76RL01830. 110p. NTIS, PC A06/MF A01. Order Number DE83008124.

The methodology and results of a test effort to determine whether there exist unexpected opportunities for the direct transfer of technologies from federal laboratories to industry are presented. Specifically, the latest results of six federal laboratories with potential application in the pulp and paper industry, particularly those results applicable to improving energy productivity, were evaluated, cataloged, and distributed to industry representatives to gauge their reaction. The principal methodological steps in this effort were the development of a taxonomy of the pulp and paper industry, identification of industry needs and laboratory capabilities, laboratory visits, review of technology findings with industry, and evaluation and compilation of industry responses.

20989 **(PNL—4592) Research options for the development of sensors to measure the thermal state of solid steel bodies. Draft final report.** Gaspar, T.A.; Lownie, H.W. Jr. (Battelle Columbus Labs., OH (USA)). May 1982. Contract AC06-76RL01830. 74p. NTIS, PC A04/MF A01. Order Number DE83007253.

The purpose of the study reported here is to assist Battelle's Pcacific Northwest Laboratory (PNL) in planning a research and development program to develop temperature sensors for metal and ceramic industries. This study focuses on sensors to measure internal temperatures within bodies of hot steel. A series of literature surveys, interviews, field visits, and meetings with steel-industry organizations was conducted in seeking answers to questions posed by PNL. These questions, with responses, are summarized.

20990 **High temperature sensor.** Tokarz, R.D. (to Dept. of Energy). US Patent 4,365,229. 21 Dec 1982. Filed date 29 Jan 1981. vp.

PAT-APPL-229421.

A high temperature sensor includes a pair of electrical conductors separated by a mass of electrical insulating material. The insulating material has a measurable resistivity within the sensor that changes in relation to the temperature of the insulating material within a high temperature range (1,000 to 2, 000 K). When required, the sensor can be encased with ceramic protective coating.

20991 **Control system to reduce the effects of friction in drive trains of continuous-path-positioning systems.** Green, W.L. (to Dept. of Energy). US Patent 4,345,194. 17 Aug 1982. Filed date 1 Dec 1980. vp.

PAT-APPL-212045.

An improved continuous-path-positioning servo-control system is provided for reducing the effects of friction arising at very low cutting speeds in the drive trains of numerically controlled cutting machines, and the like. The improvement comprises a feed forward network for altering the gain of the servo-control loop at low positioning velocities to prevent stick-slip movement of the cutting tool holder being positioned by the control system. The feed forward network shunts conventional lag-compensators in the control loop, or loops, so that the error signal used for positioning varies linearly when the value is small, but being limited for larger values. Thus, at higher positioning speeds there is little effect of the added component upon the control being achieved.

20992 **(PB—82-240508) Possibilities of energy recovery and integrated energy supply of foundries.** Pautz, J. (Elektowaerme-Inst. e.V., Essen (Germany, F.R.)). Jul 1982. Translation of Trans. of unidentified German mono. 40p. NTIS, PC A03/MF A01.

The possibilities of energy recovery and an integrated energy supply of foundry operations which are equipped with arc furnaces are reported. The basis for these considerations are the heat balances of arc furnaces with conventional fp-lining and with water-cooled lining. It is shown that with the usual design of the cooling water loops, the systems for heating utility water and for heating buildings and halls, which are possible for induction furnaces and also applicable to arc furnaces. Furthermore, the possibility is pointed out of improving the economy of scrap-drying systems by preheating the combustion air. Finally, under the presupposition of a transition to pressurized water or evaporation cooling, possibilities are indicated for steam generation to feed into remote heating networks or operational steam networks, or to support steam generating systems by preheating the boiler feedwater.

20993 **(PB—82-213778) Energy production from waste heat by means of elastomers or memory metals.** Ljung, L. (Styrelsen foer Teknisk Utveckling, Stockholm (Sweden)). May 1982. Translation of unidentified Swedish mono., n.p., May 80. See also N81-21551. (STU—79-6394). 58p. NTIS, PC A04/MF A01.

Results are given of an examination of the possibility of energy production from waste heat with memory metals or elastomers. A primary concern has been to present a general description of the thermodynamic limitations on extracting the energy content of waste heat. Thus, the main part of the study deals with efficiency in various conversion processes including ideal processes, conventional conversion processes such as the Rankine cycle, and unconventional processes. The unconventional conversion process treated are those which utilize memory metals, elastomers, or ferromagnetism. The results could also be applied to other types of conversion processes.

20994 (ANL/NESC—911R) DESA; district energy system cost energy model. Morofsky, E.L.; Verma, V. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048911.

Maxima of - 300 network nodes (includes buildings, branch points, and plants) 3 plants 30 years project life.

DESA (District Energy System Analysis) is a computerized design and cost energy accounting model that facilitates analysis of alternative methods of providing heating, cooling, and electrical power generation to urban areas. The model will develop the dollar and energy costs of a proposed system from specified demand load configuration of the system, the location and type of central plant, and certain financial assumptions. Comparisons are based on present value dollar costs for construction and operation over the life cycle of a system and the number of energy units consumed in the creation and operation of the energy supply systems. DESA is intended for application at the feasibility stage. The model permits selection of alternative energy sources to produce heating, cooling, and electrical power generation, and can provide cost and service comparisons for alternative development plans. Sources can include oil, gas, or coal, refuse through incineration or pyrolysis, and waste heat. The fuel selected is burned to heat water or produce steam, which can be used to run turbines that generate electricity, drive centrifugal chillers for cooling services, or simply to provide heating services. In cases where electrical generation is chosen as an option, the waste heat produced in the generation process can be used to provide buildings with heating and cooling (absorption) through either hot water or steam.IBM370,303x; FORTRAN IV; OS/370; Each of the seven DESA modules can execute in 140K bytes of memory.

20995 (BMFT-FB-T—80-109) Energy consumption analysis and comparative study of the operational results from heat pump plants. Final Report, Oct. 1979. Mueller, P.; Bewer, B.; Klaus, H.; Sander, W.; Wirthwein, H.J.G. (Vereinigte Elektrizitaetswerke Westfalen A.G. (VEW), Dortmund (Germany, F.R.)). Dec 1980. 240p. (In several languages). NTIS, PC A11/MF A01.

Electric energy consumption with inclusion of the electricity consumption of the supplementary and auxiliary equipment is considered. Costs are divided into plant costs for heat pumps, heating systems and auxiliary equipment, installation costs for heat pumps, heating systems and auxiliary equipment, operating costs and maintenance costs. Specific energy consumption and cost statements were determined. Operational experiences were reviewed and the energetic operational behavior, including supplementary and auxiliary equipment for a random test of plants, is discussed. (ESA)

20996 (CONF-820627—13) Urban air-quality impacts of district-heating development. Blaney, B.L.; Levine, E.P. (Environmental Protection Agency, Cincinnati, OH (USA). Industrial Environmental Research Lab.; Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 25p. NTIS, PC A02/MF A01. Order Number DE83007609.

From 75. annual meeting on the Air Pollution Control Association; New Orleans, LA, USA (20 Jun 1982).

The major factors that influence the city-wide annual average air-quality impacts of district-heating development are evaluated. The analysis is based on previous case studies of the environmental impacts of district heating and on emissions inventories for different energy-conversion sources and for metropolitan areas. The principal factors which affect the air-quality impacts of district-heating development are source stack height and pollution controls, fuel type, location of displaced space heating sources and the extent to which these displaced sources contributed to fuel-combustion emissions in urban areas. It is shown that district heating development may significantly improve city-wide sulfur dioxide pollution concentrations, but will have little effect on total suspended particulates. The degree of impact on nitrogen dioxide concentrations appears to lie between these two extremes. Generally, incremental emissions attributable to district-heating sources will not greatly increase city-wide annual average pollution concentrations because these sources centralize emissions in tall stacks. However, if the district-heating system is powered by numerous small- or medium-sized sources with short-to-medium stack height, a significant degradation in air quality may occur.

20997 (CONF-830213—1) Wastewater reclamation and methane production using water hyacinth and anaerobic digestion. Chynoweth, D.P.; Dolenc, D.A.; Schwegler, B.; Reddy, K.R. (Institute of Gas Technology, Chicago, IL (USA)). 1983. 13p. Institute of Gas Technology, 3424 South State Street, IIT Center, Chicago, IL 60616.

From 10. energy technology conference; Washington, DC, USA (28 Feb 1983).

Research reported here supports the conclusion that water hyacinth ponds are effective in the secondary treatment of domestic wastewater and under these conditions exhibited an average growth yield of 60 dry tons/ha-yr. However, treatment efficiencies and growth yields vary significantly in response to factors which include: (1) of nutrients in the pond influent; (2) residence times and water depth; (3) cultural techniques such as plant density and harvest frequency; (4) environmental conditions such as temperature, frost, etc.; and (5) insect infestation. These variables are under more intense study using smaller scale experiments. The results of these studies will be employed to determine optimum conditions for operation of the larger ponds. Work thus far completed on the anaerobic digestion of hyacinth and sludge has provided information on feed properties, feed biodegradabilities, digestion efficiencies under conventional digestion, nutritional balance, and the effects of blend constituents on methane yield and production rate. It is known that these feeds can be digested without external nutrient addition or pH control. The kinetics and efficiencies are comparable to those of other biomass or waste feeds; in fact, the yield from primary sludge is the highest we have seen reported for particulate feeds. Two conventional digester designs are currently exhibiting a significant increase in feed conversion to methane. Future laboratory research will continue to focus on advanced digestion and pretreatment for improvement of conversion efficiencies and net energy production. This will be complemented by operation of a larger scale experimental test unit.

20998 (CONF-8210126—1) Anaerobic sludge digestion with a biocatalytic additive. Ghosh, S.; Henry, M.P.; Fedde, P.A. (Institute of Gas Technology, Chicago, IL (USA); Texas Gas Transmission Corp., Owensboro, KY (USA)). 1982. 25p. Inst. of Gas Tech., 3424 South State Street, IIT Center, Chicago, IL 60616.

From 55. annual conference on water pollution control; St. Louis, MO, USA (3 Oct 1982).

The objective of this research was to evaluate the effects of a lactobacillus additive an anaerobic sludge digestion under normal, variable, and overload operating conditions. The additive was a whey fermentation product of an acid-tolerant strain of Lactobacillus acidophilus fortified with $CaCO_3$, $(NH_4)_2HPO_4$, ferrous lactate, and lactic acid. The lactobacillus additive is multifunctional in nature and provides growth factors, metabolic intermediates, and enzymes needed for substrate degradation and cellular synthesis. The experimental work consisted of several pairs of parallel mesophilic (35°C) digestion runs (control and test) conducted in five experimental phases. Baseline runs without the additive showed that the two experimental digesters had the same methane content, gas production rate (GPR), and ethane yield. The effect of the additive was to increase methane yield and GPR by about 5% (which was statistically significant) during digester operation at a loading rate (LR) of 3.2 kg VS/m^3-day and a hydraulic retention time (HRT) of 14 days. Data collected from the various experimental phases showed that the biochemical additive increased methane yield, gas production rate, and VS reduction, and decreased volatile acids accumulation. In addition, it enhanced digester buffer capacity and improved the fertilizer value and dewatering characteristics of the digested residue.

20999 (DOE/RA/50314—1) I-95 Sanitary-Landfill gas recovery and utilization feasibility study. (District of Columbia Dept. of Environmental Services, Washington, DC (USA)). Feb 1983. Contract FG01-80RA50314. 169p. NTIS, PC A08/MF A01. Order Number DE83006934.

This feasibility study was designed to determine the viability of a landfill gas recovery (LFG) recovery and utilization system at the I-95 Sanitary Landfill in Lorton, Virginia. Specific objectives included estimating the quantity and quality of recoverable LFG, evaluating alternatives for LFG use, developing a phased LFG recovery program, and assessing the environmental, health, safety, and socio-economic impacts of such a program.

21000 **(DOE/RA/50377—3) Cogeneration energy-recovery facility feasibility study: environmental rport.** (Nashville Electric Service, TN (USA)). Feb 1983. Contract FG01-80RA50377. 56p. NTIS, PC A04/MF A01. Order Number DE83008164.

Analyses are given of the impacts on the broad environment that will result from the construction and operation of the Nashville Electric Service Cogeneration Energy Recovery facility (NES CERF). Analyses are presented for water, waste-water, air and solid waste environmental impacts, as well as safety, health and socioeconomic considerations. The environmental, safety, health and socioeconomic impacts of the project will be minimal particularly when the positive secondary energy and landfill impacts are considered. All legal and administrative demands resulting from the proposed construction have and will be met. The time frame required to obtain necessary environmental permits will not require an extension of the construction schedule set up for the project. Based on the analysis, the following recommendations can be made: owner should monitor the CERF environmental responses and output as necessary in order to keep all environmental, safety, health and socioeconomic impacts at satisfactory levels; owner management should remain abreast of legislative developments in the areas of water, air and solid waste, in order to anticipate any necessary changes in procedures and operations; and frameworks should be set up to insure and maintain employee safety and operational training at peak levels.

21001 **(NYSERDA—81-30) Radisson community heating systems: technical and economic comparison of options. Final report.** Lester, W.A.; Becker, R.D.; Funnell, J.H.; Cardinal, R.A. (O'Brien and Gere Engineers, Inc., Syracuse, NY (USA)). Dec 1981. 130p. New York State Energy Research and Development Authority, Two Rockefeller Plaza, Albany, NY 12223.

The study reported was conducted to evaluate water source community heat pump systems for possible installation to serve a number of homes which are to be constructed in the northeast section of Radisson, New York. Although specific sites and facilities have been evaluated, it is the intent of this study to be site specific only to the extent of climatic conditions. In other words, the results of this study should apply to any area with similar climate.

21002 **(NYSERDA—82-24) Methanol from landfill gas: technology and economics. Final report.** Hollomon, J.B. (International Harvester Co., Burr Ridge, IL (USA)). Dec 1982. 363p. New York State Energy Research and Development Authority, Two Rockefeller Plaza, Albany, NY 12223.

The production of methyl alcohol from methane evolved from sanitary landfills was investigated. The approach considered involves pretreatment and steam reforming to produce carbon monoxide and hydrogen, followed by thermochemical methanol synthesis based on conventional technology. A modular packaged plant concept would limit capital costs while providing for small size consistent with resource availability. The assessment consisted of detailed conceptual process design of an integrated facility, cost estimates and financial analysis, laboratory investigation of the composition of gas from the Fresh Kills landfill on Staten Island, market analysis of potential sites and methanol uses in New York State, and a discussion of public policy options. Results include conditions under which operation could be economical as well as strategies for introducing product methanol into the marketplace. Extensive chemical data produced in the course of the project characterize the contaminants that might affect process performance or economics. Policies that the state government could adopt to promote investment in landfill gas to methanol conversion are also identified.

21003 **(ORNL/TM—6830) District heating/cogeneration application studies for the Minneapolis-St. Paul area. Summary of Twin Cities case study and the St. Paul Project.** Karnitz, M.A.; Kolb, J.O. (Oak Ridge National Lab., TN (USA)). Feb 1983. Contract W-7405-ENG-26. 88p. NTIS, PC A05/MF A01. Order Number DE83008170.

A site-specific study was conducted to evaluate the feasibility of a large, cogeneration/district-heating system for US cities. The MInneapolis-St. Paul area was chosen as the site for a case study of a modern hot-water district-heating system. The first phase of the work was a conceptual feasibility study for the entire metropolitan region. The effort concentrated on assessing the heat loads and heat sources that could be connected over a 20-year period. This study phase set the framework for the overall potential for district heating in the region and was the stimulus for the sceond phase, the St. Paul district-heating demonstration project. The St. P District-Heating Development Company is planning to build the first modern hot-water district-heating system in a major US city.

21004 **(ORNL/TM—6830/P7) District heating/cogeneration application studies for the Minneapolis-St. Paul area. Building conversion costs and economics for the St. Paul hot water district heating market.** Kolb, J.O.; Teichman, K. (Oak Ridge National Lab., TN (USA)). Feb 1983. Contract W-7405-ENG-26. 72p. NTIS PC E03/MF A01. Order Number DE83008171.

Includes 1 sheet of 24x reduction microfiche.

A study of methods and costs for converting buildings' heating systems to a hot water supply in St. Paul, Minnesota is summarized. The general characteristics of an economic analysis are presented for a typical building with a current energy source of either steam district heat or natural gas. Building heating systems were classified by the distribution media - steam, hot water, and air - and also by the heating system configuration - perimeter heating and/or air ventilation heating. Conversion cost results for hot water distribution system buildings average $40/kW(t) of demand, as opposed to $200/kW(t) for the steam perimeter heating systems. The economic analysis results were characterized by the payback period. Payback periods are found to be longer for current steam users than for natural gas customers. (LEW)

21005 **(ORNL/TM—6830/P10-Vol.1) District heating/cogeneration application studies for the Minneapolis-St. Paul area. Market assessment and economic analysis of the St. Paul district heating system.** Nyman, H.O.; Kolb, J.O.; Krautbauer, M. (Oak Ridge National Lab., TN (USA)). Feb 1983. Contract W-7405-ENG-26. 150p. NTIS PC E06/MF A01. Order Number DE83008303.

The goals of the St. Paul District Heating Demonstration Project are: (1) to assess the detailed economic feasibility of a cogeneration, hot water district heating system servicing the commercial core area of St. Paul, Minnesota, and (2) to develop an implementation plan for financing and construction of the first phase of the system over a four- to five-year time span. The results of the economic feasibility assessment and the implementation plan are presented. The economic assessment is based on engineering studies of the detailed heat load and market definition, building conversion methods and costs, St. Paul area heat sources, and the conceptual design of the piping distribution system. Extensive use of Swedish hot water district heating technology and experience with cogeneration heat sources is incorporated in the design to minimize capital and operating costs. The heat load survey determined a 300-MW(t) total heat load in the initial market area. The market is composed of over 300 buildings, including four major hospitals and the State Capitol complex. A significant fraction (50%) of the buildings have internal steam distribution systems, many of which are old and in need of repair. Building conversion studies disclosed a wide range of costs for upgrading and connection of a 250°F hot water supply system. Costs were estimated for the piping systems, peaking heat sources, and building conversion from project studies. The results of the preliminary economic feasibility study established the business plan and key project requirements leading to the construction of a $44 million hot water district heating system in St. Paul.

21006 (PB—82-218488) **Environmental services: energy conservation in wastewater treatment (a case study from the urban consortium).** (Public Technology, Inc., Washington, DC (USA)). 1980. 6p. NTIS, PC A02/MF A01.

This pamphlet summarizes efforts on the Federal and local levels to promote energy conservation while maintaining or improving water quality. Some municipalities have been implementing energy conservation strategies in their initial treatment plant designs. Such a case study is described--the Southerly Wastewater Treatment Plant of Cleveland, Ohio. This energy conservation program uses incineration to provide steam for sludge processing, with heat recovery, from clarifier skimmings and sludge. Building heat is supplied in part by the use of heat pumps and energy wheels--devices which transfer building exhaust heat to incoming ventilation air. The heat pumps use the treated wastewater discharge from the plant. The pumps will heat eight buildings with an estimated equivalent savings of 265,000 gallons of fuel oil annually. It is concluded that the program is both workable and cost-effective.

21007 (PB—82-260415) **Waste products in Missouri with potential highway application. Missouri cooperative highway research program (final).** (Missouri State Highway Dept., Jefferson City (USA). Div. of Materials and Research). Apr 1982. 70p. NTIS, PC A04/MF A01.

A statewide survey to locate solid waste products having potential for highway applications was conducted during 1981. The survey inventory includes 305 separate entries representing some 80 million tons of waste material currently accumulating at an annual rate of about 5 million tons. Due to the State being a prime source of metal ore mining and smeltering, vast tonnages of mine tailings have accumulated. Also, considerable tonnages of electric utility waste products continue to accumulate in the form of fly ash, dry bottom boiler ash, and wet bottom boiler slag. Possible uses for each waste material product are cited. From the summarized inventory, certain waste products were selected that appear to warrant further evaluation.

21008 (WSUN—139) **Handbook on solar energy and energy conservation for Arizona local governments.** Osborn, D.E.; Pfister, S.; Harper, D.; English, T.; Biddle, W.; Smith, D. (Arizona Energy Office, Phoenix (USA); Western SUN of Arizona, Phoenix (USA)). Fal 1981. 194p. NTIS, PC A09/MF A01 - Arizona Energy Office, 1700 W. Washington, Phoenix AZ 85007. Order Number DE82903951.

Three Guidebooks comprise the Handbook. Guidebook 1 provides information for local leaders on how to initiate and develop a local energy program. Guidebook 2, Planning and Zoning for Solar Access, provides assistance to people involved in the development and operation of planning and zoning methods to provide local solar access protection. Guidebook 3, Incorporating Solar Energy Conservation into Local Codes, provides assistance to the key people involved in the development and operation of local building codes. The paths that 15 communities took in Arizona took in designing their energy plan are summarized. A case study of Tucson, Arizona emphasizing land use regulations and the use of solar energy is presented in two parts: Potential Barriers to the Use of Solar Energy in Tucson and Solar Planning Options for the City of Tuscon. 21009 (AD-A—115073/9) **Turbocharging of small internal combustion engine as a means of improving engine/application system fuel economy-further turbocharger improvements. Final report Oct 80-Feb 82.** Arvin, J.R. (Aerodyne, Dallas, TX (USA)). Apr 1982. 80p. NTIS, PC A05/MF A01.

Improvements to a small diesel engine turbocharger were made based on data gathered during a previous Army contract. The improved turbocharger was fabricated and tested on a small, four cylinder, 239 CID diesel engine. Engine dynamometer test data revealed a 2 to 9 percent reduction in fuel consumption at all points over the operating envelope. A turbocharger was operated for 1011 hours at speeds between 70000 and 78000 rpm without incident. The ball bearings were in excellent condition at the end of the test. A math model of the engine and turbocharger was generated. The model was used to estimate 13 Mode Federal Diesel Emissions Cycle, the LA4 driving cycle and the application of the variable area turbine nozzle (VATN) turbocharger to a diesel engine driven generator set. A recommendation was made to build a gen set demo unit. A fuel savings of 8 to 10 percent was estimated for a 30KW DED generator set.

21010 (AD-A—118819/2) **Efficiency improved turboprop. Technical memo.** Gearhart, W.S. (Pennsylvania State Univ., University Park (USA). Applied Research Lab.). 10 Jun 1982. 29p. NTIS, PC A03/MF A01.

Renewed attention has been focused on the efficiency of aircraft propulsion as the cost of fuel has risen. Studies conducted by NASA (1) to obtain fuel efficient aircraft have considered relatively highly-loaded turbo-prop systems. The disc loadings of these propellers are as much as four times higher than those on present turboprop aircraft. The higher disc loadings result in greater slipstream swirl and higher energy losses. Of primary importance is the radial distribution of the energy losses across the slipstream due to the tangential and axial velocities. This study presents the results of analysis defining the various sources of energy loss resulting from a swirling slipstream downstream of a propeller. Experimental data are presented demonstrating the presence of such losses and a propeller configuration discussed which offers improved propulsive performance when relatively highly-loaded propellers are employed.

21011 (DOE/AL/17575—T1) **Optical diagnostics for diesel-engine applications.** Sangiovanni, J.J.; Dobbs, G.M.; Bonczyk, P.A. (United Technologies Corp., East Hartford, CT (USA). Research Center). Jan 1983. Contract AC04-81AL17575. 72p. NTIS, PC A04/MF A01. Order Number DE83007201.

Investigations were conducted of the applicability and limitations of Coherent Anti-Stokes Raman Spectroscopy (CARS) and a combination of laser light extinction and Mie scattering, respectively, to measurements of thermometry and species concentrations and of particulate size and concentration in sooty combustion environments typical of diesel combustion processes. The experimental methods used, and the difficulties in discriminating between soot particles and fuel droplets when using these methods are discussed. CARS measurements were performed on a highly-sooting, gaseous-fueled, diffusion flame and a wick-fed, diesel-fueled flame with the objective of measuring the levels of laser-induced, soot-generated interferences. These results are used to assess the viability of CARS as a diagnostic technique for diesel combustion. Potential soot-generated interferences to CARS, identified in some early studies, were not observed. However, in the wick-fed, diesel-fueled flame there were regions of the flame in which gas breakdown could not be avoided. Under these conditions, the CARS signal was unobtainable using the high-spatial-resolution configuration. The atmospheric-pressure flames used in these model experiments are, of course, only partially successful in emulating diesel combustion. In assessing the potential use of CARS for routine diesel applications, a recommendation is made that similar investigations be carried out under conditions which simulate diesel conditions more closely by being at higher pressures; geometries which control the optical field intensities well enough to control breakdown should also be explored.

21012 (DOE/CS/56051—8) Status of alcohol fuels utilization technology for highway transportation: a 1981 perspective. Volume II. Compression-ignition engines. (Mueller Associates, Inc., Baltimore, MD (USA)). Nov 1982. Contract AC05-79CS56051. 129p. NTIS, PC A07/MF A01. Order Number DE83008127.

The current status of the technologies of alcohol utilization in highway transportation diesel engines is reviewed. The use of methanol, ethanol, and certain of their derivatives in diesel-engine-powered vehicles is treated in this volume. The results of engine, vehicle and fuels testing are summarized. The topics of fuel properties, power output, fuel consumption, thermal efficiency, ignition delay, rate of pressure rise, engine noise, operability, exhaust emissions, smoke, materials compatibility, engine wear, and safety are discussed based on the data available at this time. The status of the technology at the time of the last comprehensive survey (1978) is summarized and discussed. Significant advances made since that time are delineated, as are remaining information gaps and areas in which more extensive investigation is still needed.

21013 (DOE/NASA/0187—82/1) Support and power-plant documentation for the gas-turbine-powered-bus demonstration program. Final report, 1 January 1980-30 September 1981. Nigro, D.N.; Stewart, R.G.; Apple, S.A. (General Motors Corp., Indianapolis, IN (USA). Detroit Diesel Allison Div.). Mar 1982. Contract AI01-77CS51044. 187p. NTIS, PC A09/MF A01. Order Number DE83002880.

The operational experience obtained for the GT404-4 gas turbine engines in the Intercity and Intracity Bus Demonstration Programs is described for the period January 1980 through September 1981. Support for the engines and automatic transmissions involved in this program provided engineering and field service, spare parts and tools, training, and factory overhauls. The Greyhound (intercity) coaches accumulated 183,054 mi (294,595 km) and 5154 hr of total operation. The Baltimore Transit (intracity) coaches accumulated 40,567 mi (65,285 km) and 1840 hr of total operation. In service, the turbine-powered Greyhound and Transit coaches achieved approximately 25% and 40% lower fuel mileage, respectively, than did the production diesel-powered coaches. The gas turbine engine will require the advanced ceramic development currently being sponsored by the DOE and NASA to achieve fuel economy equivalent not only to that of today's diesel engines but also to the projected fuel economy of the advanced diesel engines of the 1990s. Sufficient experience was not achieved with the coaches prior to the start of service to identify and eliminate many of the problems associated with the startup of new equipment. Because of these problems, the mean miles between incident were unacceptably low. The future gas turbine system should be developed sufficiently to establish satisfactory durability prior to evaluation in revenue service. Commercialization of the gas turbine bus engine remains a viable goal for the future.

21014 (PB—82-230376) Estimated maintenance and repair requirements for coal-fired propulsion systems. Final report. Little, D.E.; Murtagh, M.M. (Sante Fe Corp., Alexandria, VA (USA)). Jun 1982. 117p. NTIS, PC A06/MF A01.

This study was directed toward identifying unique maintenance and repair requirements in terms of manpower and materials for coal-fired steam turbine propulsion plant ships. The method of approach included surveys of industrial and marine coal-fired plant operators and coal-firing equipment manufacturers to obtain a data base of manpower and material requirements for a range of plant sizes and operating scenarios. A national coal-fired plant was then developed and the maintenance data base adapted to the marine coal-fired system. From this information, required crew manpower was determined and compared to typical oil-fired systems and associated manpower availability evaluated. Material and contract manpower costs were assessed and parametric data developed to allow potential operators to estimate daily maintenance and repair costs.

21015 (PB—82-235854) Fuel economy and exhaust emissions characteristics of a diesel vehicle: results of the prototype Volkswagen 1.5-liter turbocharged rabbit tests. Final report. Walter, R.A.; Quayle, S.S.; Sturm, J.C. (Department of Transportation, Cambridge, MA (USA). Transportation Systems Center). Oct 1981. 85p. NTIS, PC A05/MF A01.

Tests were performed on a prototype Volkswagen (VW) Turbocharged (TC) Rabbit diesel vehicle on a chassis dynamometer. The vehicle was tested for fuel economy and emissions on the Urban Federal Test Procedure (FTP), Highway Fuel Economy Test (HFET), Congested Urban Expressway (CUE), and New York City Cycle (NYCC). Steady state measurements were performed at three speeds. Particulate measurements were completed at all test conditions. Approximately 250 grams of particulate matter were collected over the HFET cycle for inclusion in the Environmental Protection Agency Diesel Health Effects Research Program. During the urban cycle the vehicle obtained 45.7 mpg, with emission rates of 0.14, 0.89 and 1.07 grams per mile of HC, CO, and NOx, respectively. The Rabbit obtained 56.5 mpg during the HFET cycle.

21016 (PB—82-253048) Vehicle operating costs in the Caribbean: an experimental study of vehicle performance. Morosiuk, G.; Abaynayaka, S.W. (Transport and Road Research Lab., Crowthorne (UK)). [nd]. 29p. NTIS, PC A03/MF A01.

This report describes an experimental study of vehicle speed and fuel consumption undertaken in the Eastern Caribbean island of St Lucia. The study was designed to extend the range of the empirical relationships derived in an earlier study in Kenya which relate vehicle speed and fuel consumption to the geometric characteristics and surface condition of the road. The results of this study are compared with the relationships derived in the Kenya study and recommendations are made on the use of the two sets of relationships. A methodology has been evolved to provide vehicle speed estimating relationships which are applicable to physical and environmental conditions lying between the two sets of conditions encountered in Kenya and St Lucia.

21017 (PB—83-101139) Review and evaluation of automotive fuel conservation technologies. Final report. Siegel, H.M.; Schwarz, R.; Andon, J.; Kolars, G.; Gerstenberger, T. (South Coast Technology, Inc., Ann Arbor, MI (USA)). Dec 1981. 267p. NTIS, PC A12/MF A01.

To support the Office of Research and Development of the National Highway Traffic Safety Administration with focused studies in areas affecting automotive fuel economy and related safety issues, a series of in-depth studies were carried out: Fuel Consumption Estimates of Stratified Charge Rotary Engines Installed in Five Vehicles; Oldsmobile Omega X Body Baseline Weight Data; GM X Body Material Substitution Weight Reduction/Cost Effectiveness Study; Calspan RSV Restraint System Cost Study; FMVSS No. 208 Extension to Light Trucks, Vans, and MPV's - Cost Lead Time Study; Multipiece Rims for Trucks, Buses, and Trailers; Identifying Design Changes, Cost Impacts and Manufacturing Lead Times to Upgrade FMVSS 114 for Passenger Cars, Trucks, and MPV's; Ford Escort GL Baseline Weight Data.

21018 (PB—83-101147) Review and evaluation of automotive fuel conservation technologies. Volume I: summary. Final report Mar 79-Sep 81. Taylor, T. Jr. (Corporate-Tech Planning, Inc., Waltham, MA (USA)). Dec 1981. 89p. NTIS, PC A05/MF A01.

A series of research tasks were instituted to assess the impact of automotive technologies and the manufacturer's overall product plans on existing and future fuel economy requirements. Supported by NHTSA's Technology Assessment Division, this program provided analytical capabilities in the areas of automotive technology, manufacturing costs, and industry assessments. Specific subject areas of investigation include: potential fuel economy improvements from variable valve timing of internal combustion engines; effects of tire under inflation on fuel economy; reductions in engine friction; automotive applications of metal/plastic laminates as a substitute material; cost, weight and material analyses of a Ford F-150 light truck; design, cost and weight analyses of truck-trailer rear underride guards; the impact of FMVSS (seat belts) comfort and convenience on vehicle manufacturing; design modifications and manufacturing costs of child seat tether anchorages; and identification of auto manufacturer's technical progress in weight reduction through material substitution and component redesign.

21019 (PB—83-101154) Review and evaluation of automotive fuel conservation technologies. Volume II: appendix C. Final report Mar 79-Sep 81. Taylor, T. Jr. (Corporate-Tech Planning, Inc., Waltham, MA (USA)). Dec 1981. 177p. NTIS, PC A09/MF A01.

The Appendices of Volumes I and II contain reports on those subject areas not previously submitted under NTIS. These subjects are: effects of automobile tire pressure changes on fuel economy; weight reduction through material substitution and component redesign; and an alternate design for truck rear underride guard protection.

21020 (PB—83-112789) Noise reduction retrofit for a 'new look' GMC transit bus: service bulletin. Final report Apr 80-Nov 81. Kaye, M.C. (Tri-County Metropolitan Transportation District of Oregon, Portland (USA)). Nov 1981. 64p. NTIS, PC A04/MF A01.

This document gives instructions on how to apply a noise treatment to a contemporary city transit bus without extensive structural alteration. Prototype anti-noise treatments of two conventional transit motorbuses were tested: a Flexible 'New Look' and a GMC 'New Look' model. Baseline bus configuration, noise ratings, and performance benchmarks are presented for a GMC model T8H-5307A transit bus, powered by a Detroit Diesel 8V-71N engine. Earlier, a Flxible model 111DC-D061 was similarly treated using the same concepts and much of the same hardware. The results are almost identical, showing the wide range of treatment applicability. This report gives instructions as to how GMC 'New Look' model is retrofitted with a turbocharged 8V-71TAC engine and ancillary hardware. The instructions include the revision of the engine aspiration system for easier breathing, the lining of the engine compartment with an anti-noise blanket, and the silencing of the hiss of the compressed air system dryer.

3302 External Combustion Engines

21021 (DOE/NASA/0032—15) Automotive Stirling-Engine Development Program. Semiannual technical progress report, July 1-December 31, 1981. Ernst, W.; Piller, S.; Richey, A.; Simetkosky, M. (Mechanical Technology, Inc., Latham, NY (USA)). Sep 1982. Contract AI01-77CS51040. 85p. (NASA-CR—167907; MIT—82ASE248SA1). NTIS, PC A05/MF A01. Order Number DE83004802.

This is the first semiannual technical progress report prepared under the automotive Stirling Engine Development Program; it covers the fourteenth and fifteenth quarters of activity after award of the contract. Quarterly technical progress reports reported program activities from the first quarter through the thirteenth quarter; thereafter, reporting was changed to a semiannual format. This report summarizes activities performed on Mod I engine testing and test results, progress in manufacturing, assembling and testing of a Mod I engine in the United States, P-40 Stirling engine dynamometer and multifuels testing, analog/digital controls system testing, Stirling reference engine manufacturing and reduced size studies, components and subsystems, computer code development activities. The overall program philosophy is outlined, and data and results are presented.

3303 Electric-powered Systems

REFER ALSO TO CITATION(S) 20781

21022 (AD-A—115843/5) Nickel-zinc batteries for RPV applications. Final technical report 15 Nov 79-15 Aug 81. Dappert, D. (Eagle-Picher Co., Joplin, MO (USA)). Feb 1982. 161p. NTIS, PC A08/MF A01.

Final technical results are presented for a program dealing with the placement of nickel-zinc batteries in specific military applications, namely the BQM-34A and the PQM-102 Remotely Piloted Vehicles (RPV's). The nickel-zinc system was selected for these applications because RPV's demand a high quality secondary battery that offers a compromise between long life (calendar and cycle) and low weight and volume.

21023 (AD-A—118333/4) Baseline and verification tests of the Unique Mobility, Inc. Electrek 2+2. Final test report 8 Aug 80-29 May 81. Dowgiallo, E.J. Jr; Chapman, R.D. (Army Mobility Equipment Research and Development Center, Fort Belvoir, VA (USA)). Mar 1982. 127p. NTIS, PC A07/MF A01.

The Electrek 2+2 by Unique Mobility, Inc. is a custom-designed vehicle with a molded fiberglass and polycarbonate body. It was tested by the U.S. Army Mobility Equipment Research and Development Command (MERADCOM) at Fort Belvoir, Virginia, as part of the Department of Energy (DOE) project to characterize the state-of-the-art of electric vehicles. The vehicle is powered by 16 6-volt lead-acid batteries through a transistorized controller to a 32-hp modified shunt wound electric motor. It has 4-speed manual transmission and disc brakes in front with drum in the rear and is equipped with regenerative deceleration.

21024 (AD-A—118741/8) Verification test of the Battronic Truck Volta Electric Pickup. Report for Jul 80-Jan 81. Dowgiallo, E.J. Jr; Snellings, I.R.; Chapman, R.D. (Army Mobility Equipment Research and Development Center, Fort Belvoir, VA (USA)). Apr 1982. 40p. NTIS, PC A03/MF A01.

The Volta Pickup is an electric 1/2-ton truck manufactured by the Battronic Truck Co. It was tested by MERADCOM at Fort Belvoir, Virginia as part of a Department of Energy project to verify conformity to performance standards of electric vehicles. The verification test results are presented in this report. The Volta Pickup is powered by 24 6-V lead-acid batteries, has a 38 hp series wound d.c. motor, SCR chopper controller, regenerative braking, and a 2-speed Helical gear transmission.

21025 (AD-A—120057/5) Verification tests of the U.S. Electricar Corporation Lectric Leopard. Technical report 3 Aug-25 Sep 81. Dowgiallo, E.J. Jr; Snellings, I.R.; Chapman, R.D. (Army Mobility Equipment Research and Development Center, Fort Belvoir, VA (USA)). Apr 1982. 39p. NTIS, PC A03/MF A01.

The Lectric Leopard manufactured by U.S. Electricar Corporation was tested at MERADCOM as part of the Department of Energy project to verify conformity to performance standards of electric vehicles. The Leopard is a standard Fiat Strada sedan which has been converted to an electric vehicle. It is powered by 16 6-V batteries through a silicon-controlled rectifier (SCR) Controller to a 23-hp series-wound d.c. motor. It is equipped with a five-speed manual transmission, power-assisted disc brakes in the front and drum brakes in the rear. It is not equipped with regenerative braking.

21026 (CONF-810111—4) Social, institutional, and public-safety impacts of electric and hybrid vehicles. Singh, M.K. (Argonne National Lab., IL (USA)). 14 Jan 1981. Contract W-31-109-ENG-38. 21p. NTIS, PC A02/MF A01. Order Number DE83007782.

From Annual meeting of the Transportation Research Board; Washington, DC, USA (12 Jan 1981).

Assuming future EHV technology developments as expected under the DOE program and as described in this paper, the social, institutional and public safety impacts of EHVs can be summarized as follows. The social impacts of EHVs may be both beneficial and adverse. In particular, the range limitations of EVs and the time required for recharge will limit the mobility of the users. However in times of liquid fuel shortages, EHVs will enhance mobility. EHVs are expected to have little or no impact on many elements of the transportation infrastructure needed to support EHV penetration. However some aspects of that infrastructure will be impacted. For example, rapid conversion of auto production lines under high penetration may present problems, compensating taxes for the federal motor fuel tax lost will have to be approved, some utilities will have to increase their generating capacity and an EHV servicing network will have to be developed. All public safety concerns are expected to be mitigated by standards promulgated as EHV commercialization proceeds. Still, further study and evaluation of many of the safety concerns are required.

21027 (CONF-8104190—1) Electric vehicles: a strategy for reduced utilization of critical fuels in transportation. Gay, E.C.; Miller, W.; Kaun, T. (Argonne National Lab., IL (USA)). Feb 1981. Contract W-31-109-ENG-38. 20p. NTIS, PC A02/MF A01. Order Number DE83007600.

From 8. annual meeting of National Organization of Black Chemists and Chemical Engineers; Chicago, IL, USA (22 Apr 1981).

The performance of lead-acid, nickel-zinc, nickel-iron, lithium/iron sulfide and sodium sulfur batteries for use in electric vehicles is briefly compared and the development of one advanced battery system, the lithium/iron sulfide battery is discussed in details. Progress in the development of Li-Al/FeS cells and hardware for high performance batteries by Argonne National Laboratory and industrial subcontractors has given promise to the expectation of developing rechargeable batteries with up to three times the energy density of the lead-acid battery and the subsequent replacement of conventional gasoline cars used for urban transportation by electric-vehicles powered by these high performance batteries. Results were shown which indicate that the Li-Al/FeS system has no inherent performance limitations which would restrict its use for this application. Recent improvements in the cell cycle life and reduction in the capacity loss rate gives promise of high cell reliability over very long cycling periods. (LCL)

21028 (PB—82-260019) Assessment of battery buses and battery technology. Final report Aug 81-May 82. (Trans Systems Corp., Vienna, VA (USA)). May 1982. 93p. NTIS, PC A05/MF A01.

Public concern, with the deterioration of the quality of the environment caused by air, water, and noise pollution, became a major public issue during the 1960s, resulting in the passage of new legislation and institutional changes in the United States. This concern was not limited to the United States, but also made itself felt with similar intensity in most of the other industrialized nations. One consequence was a renewed interest in the use of electric power for propulsion with reduced pollutant emissions and noise levels as a substitute for the internal combustion engine. Because of its effect on the urban environment and its visibility, the transit bus became a prime target for conversion to electric propulsion, particularly through the use of the electric storage battery. In general, electric power is now an attractive alternative to the use of petroleum-based fuels in urban transportation.

21029 (PB—83-126086) Synthetic fuels for transportation. Background Paper Number 1: the future potential of electric and hybrid vehicles. Carriere, W.M.; Hamilton, W.F.; Morecraft, L.M. (Office of Technology Assessment (U.S. Congress), Washington, DC). Mar 1982. 236p. NTIS, PC A11/MF A01.

This report presents a comprehensive review of the future of electric and hybrid vehicles through the year 2010 in the United States. It discusses the technology, performance, and limitations of probable future electric and hybrid vehicles; the infrastructure necessary to produce and support them; marketability; and finally, effects on the nation if used in large numbers.

21030 (UCRL—88221) Comments on "Technology for the renewal of transportation infrastructure". O'Connell, L.G. (Lawrence Livermore National Lab., CA (USA)). Sep 1982. Contract W-7405-ENG-48. 8p. (CONF-820999—1). NTIS, PC A02/MF A01. Order Number DE83006582.

From California business: realities/prospects conference; Berkeley, CA, USA (13 Sep 1982).

Comments on paper by William L. Garrison.

The technical improvements that have been made in both battery-powered and roadway-powered electric vehicles, and the contribution that expanded use of such vehicles in the USA could make toward continued population mobility, decrease dependence on petroleum, and decreased urban traffic congestion and pollution are discussed. (LCL)

21031 (CAPE—2706) Near term electric test vehicle ETV-2 (Engineering Materials). (AiResearch Mfg. Co., Los Angeles, CA (USA)). [nd]. Contract AC03-76CS51213. TIC. Order Number DE83006423.

Engineering drawings are provided for ETV-2, a unique battery-powered passenger vehicle has been developed that provides a significant improvement over conventional electric vehicle performance, particularly during stop-and-go driving. The vehicle is unique in two major respects: (1) the power system incorporates a flywheel that stores energy during regenerative braking and makes possible the acceleration capability needed to keep up with traffic without reducing range to unacceptable values; and (2) lightweight plastic materials are used for the vehicle unibody to minimize weight and increase range. Reference DOE/CS/51213-01. (WHK)

21032 (UCRL—88107) Can fiber-composite flywheels increase automobile fuel economy. O'Connell, L.G. (Lawrence Livermore National Lab., CA (USA)). Dec 1982. Contract W-7405-ENG-48. 16p. (CONF-830408—2). NTIS, PC A02/MF A01. Order Number DE83005336.

From 28. national Society for the Advancement of Materials Process Engineers symposium; Anaheim, CA, USA (12 Apr 1983).

Overall petroleum consumption in the US has decreased, but no in the transportation sector. In 1981, transportation's use of petroleum increased. If we are to stop this trend without curtailing the vehicle miles traveled (VMT), automobiles must get smaller or the fuel economy of the current sizes must increase. Flywheels have long been considered as a means of improving fuel economy. Flywheels utilized with the internal combustion engine (ICE) allow the engine to be load-leveled. Thus the engine can operate in the region of minimum brake specific fuel consumption or maximum fuel economy. In addition, the flywheel can be used to recover the vehicle's kinetic energy during deceleration and braking operations for later use during acceleration. This adds further to the vehicle's fuel economy. There are two general approaches to the use of the flywheel. In one case, the flywheel power boosts the ICE-supplies power transients, and in the other case, the flywheel drives the wheels and is recharged by the ICE periodically at a constant rate. Each of these approaches has different implications for the flywheel and fiber composite flywheels, in particular. These implications are discussed. This paper results from a recent review of analytical studies of flywheel/heat engine propulsion systems for automobiles that have been conducted over the last 10 or so years and the current expectations of the Fiber Composite Flywheel Development Project within the Transportation Systems Research Program at LLNL. This has provided a more global understanding of the propsects for fiber composite flywheels to increase fuel economy. It has also surfaced issues that need to be addressed both experimentally and analytically if fiber composite flywheels are to find a niche in the automotive market. These findings are presented.

21033 (PB—83-116830) Characterization of exhaust emissions from methanol- and gasoline-fueled automobiles. Final report Jun 81-Mar 82. Smith, L.R.; Urban, C.M. (Southwest Research Inst., San Antonio, TX (USA)). Aug 1982. 180p. NTIS, PC A09/MF A01.

This report describes the laboratory effort to characterize regulated and unregulated exhaust emissions from four light-duty, spark-ignited automobiles. Two of the automobiles, a 1981 Ford Escort and a 1981 Volkswagen Rabbit, were evaluated with gasoline; one of these was also operated on a gasoline-alcohol blend. The two other vehicles, also a 1981 Escort and a 1981 Rabbit, were evaluated with methanol fuel. The automobiles were evaluated over the Light-Duty Federal Test Procedure (FTP) and the Highway Fuel Economy Driving Schedule (HFET). Additional evaluations with the methanol-fueled Escort and Rabbit were conducted using promoted base metal catalysts, and the Escort was evaluated in a non-catalyst configuration. Exhaust constituents measured, in addition to the regulated emissions, include: aldehydes (including formaldehyde), particulates, individual hydrocarbons, methanol, ethanol, ammonia, cyanide, amines, nitrosamines, and methyl nitrite. Additional exhaust evaluations included mass spectral and Ames bioassay analyses.

21034 **(DOE/R5/10332—1) Alternate vehicle fuel for small fleet. Final technical report, September 28, 1981-December 24, 1982.** (Rice Lake, City of, WI (USA)). Dec 1982. Contract FG02-81R510332. 17p. NTIS, PC A02/MF A01. Order Number DE83007132.

The goal for the City of Rice Lake using the Department of Energy's Grand Award was to establish a methane fuel station and a ten-vehicle fleet as a demonstration project. The project would serve municipal and commercial vehicles to demonstrate an alternate utilization of our energy source (natural gas) and the benefits derived from it. Operational data was properly documented so commercial firms, institutions, and individuals can utilize the data for evaluating cost benefit ratio. Through the use of methane gas, the fuel cost to the City is projected to be reduced by 50% while utilizing a safer, cleaner, and nationally produced fuel.

21035 **(CONF-820547—16) Diffusion mechanisms in grain boundaries in solids.** Peterson, N.L. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 40p. NTIS, PC A03/MF A01. Order Number DE83007731.

From 84. annual meeting of the American Ceramic Society; Cincinnati, OH, USA (2 May 1982).

A critical review is given of our current knowledge of grain-boundary diffusion in solids. A pipe mechanism of diffusion based on the well-established dislocation model seems most appropriate for small-angle boundaries. Open channels, which have atomic configurations somewhat like dislocation cores, probably play a major role in large-angle grain-boundary diffusion. Dissociated dislocations and stacking faults are not efficient paths for grain-boundary diffusion. The diffusion and computer modeling experiments are consistent with a vacancy mechanism of diffusion by a rather well-localized vacancy. The effective width of a boundary for grain-boundary diffusion is about two atomic planes. These general features of grain-boundary diffusion, deduced primarily from experiments on metals, are thought to be equally applicable for pure ceramic solids. The ionic character of many ceramic oxides may cause some differences in grain-boundary structure from that observed in metals, resulting in changes in grain-boundary diffusion behavior. 72 references, 5 figures.

21036 **(NASA-CR—165076) NBS: materials measurements.** Manning, J.R. (National Bureau of Standards, Washington, DC (USA)). Jun 1981. 149p. NTIS, PC A07/MF A01.

Measurement of materials properties and thermophysical properties is described. The topics discussed are: surface tensions and their variations with temperature, impurities' convection during unidirectional solidification, measurement of high temperature thermophysical properties of liquid and solid tungsten, thermodynamic properties of refractory materials at high temperatures, and experimental and theoretical studies in wetting and multilayer adsorption.

21037 **(NIM—2115) Estimation of material variation in powdered materials. Report No. 2115.** Ellis, P.J.; Venter, J.H.; Steele, T.W. (National Inst. for Metallurgy, Randburg (South Africa). Analytical Chemistry Div.). 26 Aug 1981. 21p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82902528.

Measures of material variation (state of homogeneity) for reference materials of powdered rocks, minerals, and ores are examined critically. It is shown that the customary analysis of variance concluding with the F-test is not a satisfactory method for the analysis of the analytical data obtained in a homogeneity experiment. It is argued that an estimation approach is more appropriate. Examples are given of values calculated from reference-material data, together with an explanation of how the results can be interpreted.

21038 **(AD-A—118288/0) Variation of the pinning force with microstructure and with the Ginzburg-Landau parameter in type II superconductors. Technical memo.** Javier, P.J. (Pennsylvania State Univ., University Park (USA). Applied Research Lab.). 1 Sep 1981. 177p. NTIS, PC A09/MF A01.

The variation of the pinning force with microstructure and with the Ginzburg-Landau parameter is studied for 53 vanadium and vanadium alloy specimens. Vanadium-carbide precipitates are used as pinning centers. The Ginzburg-Landau parameter is varied by alloying the vanadium with small quantities of gallium or niobium. Alloy compositions of V-0.20a/o Ga, V-1.05a/o Ga, V-2.96a/0 Ga, and V-4.01a/o Nb are used.

21039 **(ANL/NESC—421) MICHRD; microhardness measurement analysis.** Baumgardt, N.R. (General Electric Co., Cincinnati, OH (USA). Aircraft Engine Group). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048421.

Maxima of - 100 temperatures for each specimen 1000 indents, summed over all temperatures, for each specimen 4 readings per indent.

The Vickers pyramid number and the microhardness increment fraction are computed from filar micrometer eyepiece readings. These readings are made on indents, which have been made by an indenter, in the material being tested.GE625,635; FORTRAN IV; GECOS; 27K memory.

21040 **(BNL—32407) Structural maps and parameters important to alloy phase stability.** Watson, R.E.; Bennett, L.H. (Brookhaven National Lab., Upton, NY (USA); National Bureau of Standards, Washington, DC (USA)). 1982. Contract AC02-76CH00016. 7p. (CONF-821107—48). NTIS, PC A02/MF A01. Order Number DE83005673.

From 6. international symposium on the scientific basis for radioactive waste management; Boston, MA, USA (1 Nov 1982).

Alloy properties are often summarized on two-dimensional maps. For instance, Darken and Gurry related the terminal solubilities of alloy systems to two coordinates (the differences in electronegativities and in atomic radii of the alloy consitituents). Maps are considered here which correlate the structures in which the compounds form as well as providing some indication of whether a compound forms at some given composition in the first place. This class of map involves one coordinate which is the difference in an atomic parameter (here it will be taken to be the electronegativity) while the other is an average (in this case the d band hole count), This contrasts with Darken Gurry maps and Giessen's maps related to glass-forming ability (elsewhere in this volume) where both coordinates are differences. The situation for 50/50 transition metal alloys is reviewed and results are presented for systems off 50/50 composition. 4 figures.

21041 **(CONF-800205—18) Voids in neutron-irradiated metals and alloys.** Hendricks, R.W. (Technology for Energy Corp., Knoxville, TN (USA)). 1980. Contract W-7405-ENG-26. 15p. NTIS, PC A02/MF A01. Order Number DE83007510.

From American Institute of Metallurgical Engineers meeting; Las Vegas, NV, USA (24 Feb 1980).

Small-angle x-ray and neutron scattering are powerful analytical tools for investigating long-range fluctuations in electron (x-rays) or magnetic moment (neutrons) densities in materials. In recent years they have yielded valuable information about voids, void size distributions, and swelling in aluminum, aluminum alloys, copper, molybdenum, nickel, nickel-aluminum, niobium and niobium alloys, stainless steels, graphite and silicon carbide. In the case of aluminum, information concerning the shape of the voids and the ratio of specific surface energies was obtained. The technique of small-angle scattering and its application to the study of voids is reviewed in the paper. Emphasis is placed on the conditions which limit the applicability of the technique, on the interpretation of the data, and on a comparison of the results obtained with companion techniques such as transmission electron microscopy and bulk density. 8 figures, 41 references.

21042 **(CONF-810831—99) Depth distribution of 2-keV helium-ion irradiation-induced cavities in nickel.** Fenske, G.; Das, S.K.; Kaminsky, M. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 6p. NTIS, PC A02/MF A01. Order Number DE83007654.

From Fusion reactor materials meeting; Seattle, WA, USA (9 Aug 1981).

Transmission electron microscopy has been used to study the effect of total dose on the depth distribution of cavities (voids or bubbles) in nickel irradiated at 500°C with 20-keV $^4He^+$ ions. A transverse sectioning technique allowed us to obtain the entire depth distribution of cavities from a single specimen. The diameter, number density and volume fraction of cavities were measured as a function of depth from micrographs taken from samples sectioned parallel to the direction of the incident beam. Results for the doses at 2.9×10^{15} and 2.9×10^{16} ions/cm^2 show an increase in the average cavity diameter, number density and volume fraction with increasing dose. A further increase in dose from 2.9×10^{16} to 2.9×10^{17} ions/cm^2 also shows an increase in the average cavity diameter but a decrease in the number density. This observation is interpreted as evidence for the coalescence of cavities. 3 figures, 1 table.

21043 **(CONF-810831—102) Modifications of subsurface alloy composition during high-temperature sputtering.** Lam, N.Q.; Wiedersich, H. (Argonne National Lab., IL (USA)). Jul 1981. Contract W-31-109-ENG-38. 6p. NTIS, PC A02/MF A01. Order Number DE83007834.

From Fusion reactor materials meeting; Seattle, WA, USA (9 Aug 1981).

Changes in the subsurface composition of concentrated binary alloys during high-temperature sputtering were studied using a kinetic model that includes Gibbsian adsorption, preferential sputtering, displacement mixing, radiation-enhanced diffusion, and radiation-induced segregation. Numerical solutions were obtained for Cu-Ni alloys under 5-keV Ar^+ ion bombardment as functions of sputtering time and temperature. The effects of these various phenomena were examined in detail. The present calculations may be of importance in the areas of plasma contamination in fusion reactors, sputter depth-profiling, and elevated-temperature ion implantation.

21044 **(CONF-810831—104) Irradiation creep in simple binary alloys.** Nagakawa, J.; Sethi, V.K.; Turner, A.P.L. (Argonne National Lab., IL (USA)). Jul 1981. Contract W-31-109-ENG-38. 7p. NTIS, PC A02/MF A01. Order Number DE83007803.

From Fusion reactor materials meeting; Seattle, WA, USA (9 Aug 1981).

Creep enhancement during 21-MeV deuteron irradiation was examined at 350°C for two simple binary alloys with representative microstructures, i.e., solid-solution (Ni - 4 at. % Si) and precipitation-hardened (Ni - 12.8 at. % Al) alloys. Coherent precipitates were found to be very effective in suppressing irradiation-enhanced creep. Si solute atoms depressed irradiation creep moderately and caused irradiation hardening via radiation-induced segregation. The stress-dependence of irradiation creep in Ni - 4 at. % Si should a transition, which seems to reflect a change of mechanism from dislocation climb due to stress-induced preferential absorption (SIPA) to climb-controlled dislocation glide enhanced by irradiation.

21045 **(CONF-811145—14) Ion-irradiation studies of cascade damage in metals.** Averback, R.S. (Argonne National Lab., IL (USA)). Mar 1982. Contract W-31-109-ENG-38. 38p. NTIS, PC A03/MF A01. Order Number DE83007645.

From International conference on neutron irradiation effects; Argonne, IL, USA (9 Nov 1981).

Ion-irradiation studies of the fundamental aspects of cascade damage in metals are reviewed. The emphasis of these studies has been the determination of the primary state of damage (i.e. the arrangement of atoms in the cascade region prior to thermal migration of defects). Progress has been made towards understanding the damage function (i.e. the number of Frenkel pairs produced as a function of primary recoil atom energy), the spatial configuration of vacancies and interstitials in the cascade and the cascade-induced mixing of atoms. It is concluded for these studies that the agitation of the lattice in the vicinity of energetic displacement cascades stimulates the defect motion and that such thermal spike motion induces recombination and clustering of Frenkel defects. 9 figures.

21046 **(CONF-811145—15) Ordered alloys reveal fundamental mechanisms of neutron-damage production.** Kirk, M.A.; Blewitt, T.H. (Argonne National Lab., IL (USA)). Apr 1982. Contract W-31-109-ENG-38. 41p. NTIS, PC A03/MF A01. Order Number DE83007776.

From International conference on neutron irradiation effects; Argonne, IL, USA (9 Nov 1981).

Magnetic saturation measurements performed on Ni_3Mn during neutron irradiations are briefly reviewed and critically re-examined. Disordering during thermal-neutron bombardment at 5°K uniquely revealed the existence,number and average length of replacement collision sequences. Confirmation of our analysis by others is presented; some refinements are introduced; comparisons with recent molecular-dynamic calculations are drawn; and the (n,γ) recoil spectrum in Ni_3Mn is reanalyzed. It is concluded that 112 to 150 $<110>$ replacements occur, within one or two sequences, per (n,γ) recoil with an average energy of 492 eV. Similar measurements on Ni_3Mn during fast-neutron bombardment at 5°K yielded the total number of replacements per typical 30 keV cascade and demonstrated that very few interstitials were produced at large distances from the cascade by $<110>$ replacement sequences. Recent results on high-resolution TEM measurements of disordered zones in fast-neutron irradiated Cu_3Au are discussed and compared with damage calculations for the accurately measured fast-neutron flux and energy spectrum in CP5 and reveal the spatial characteristics of the deposited energy in individual cascades. Resistivity measurements of Cu_3Au during fast-neutron bombardment at 150°C have revealed both the disordering process within cascades and ordering by irradiation-enhanced vacancy diffusion. These experiments provide a means of comparing different neutron energy spectra and studying irradiation-enhanced diffusion in a system amenable to theoretical treatments.

21047 **(CONF-811145—17) Quantitative comparison of the void distribution in a β'-phase Ni-Al-In alloy using x-ray small-angle scattering and transmission-electron microscopy.** Epperson, J.E.; Loomis, B.A.; Lin, J.S. (Argonne National Lab., IL (USA)). Nov 1981. Contract W-31-109-ENG-38. 29p. NTIS, PC A03/MF A01. Order Number DE83007856.

From International conference on neutron irradiation effects; Argonne, IL, USA (9 Nov 1981).

Small-angle scattering is a rather mature discipline which can yield valuable information on the size, amount, and distribution of inhomogeneities encountered in materials-science research. Methods have been publisheed which permit one to extend the standard analysis of data from a small-angle-scattering experiment to include determination of the distribution of particle sizes. This extended analysis has been carried out for voids in a β'-phase Ni-Al-In alloy, and, in order to assess the reliability of the procedure, the identical void distribution as been characterized by transmission-electron microscopy. A quantitative comparison is made of the results from thses two independent experiments, and the general performance of the Brill-Schmidt method for particle-size determinations is discussed. 6 figures, 1 table.

21048 (CONF-811150—12) **Mechanism and kinetics of radiation-induced segregation in Ni-Si alloys.** Okamoto, P.R.; Rehn, L.E.; Averback, R.S.; Robrock, K.H.; Wiedersich, H. (Argonne National Lab., IL (USA); Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Festkoerperforschung). Nov 1981. Contract W-31-109-ENG-38. 7p. NTIS, PC A02/MF A01. Order Number DE83007854.

From Yamada conference on point defects and defect interactions in metals; Kyoto, Japan (16 Nov 1981).

Rutherford-backscattering and Auger chemical-depth-profiling measurements show that films of the γ'-Ni_3Si phase produced on the ion-bombarded surfaces of Ni-Si alloys obey simple parabolic growth kinetics. At low temperatures the film growth-rate constant exhibits Arrhenius behavior and varies with the fourth root of the dose rate. The apparent activation energy in this low-temperature region is ~ 0.3 eV. At high temperatures the growth constant is independent of the dose rate. The results are consistent with a diffusion-controlled growth model, which assumes Si atoms migrate in the form of a fast-diffusing Si-interstitial complex.

21049 (CONF-820274—1) **Defects in metals.** Siegel, R.W. (Argonne National Lab., IL (USA)). Jun 1982. Contract W-31-109-ENG-38. 40p. NTIS, PC A03/MF A01. Order Number DE83007638.

From 2. national symposium on positron annihilation; Madras, India (8 Feb 1982).

The application of positron annihilation spectroscopy (PAS) to the study of defects in metals has led to increased knowledge on lattice-defect properties during the past decade in two areas: the determination of atomic defect properties, particularly those of monovacancies, and the monitoring and characterization of vacancy-like microstructure development during post-irradiation and post-quench annealing. The study of defects in metals by PAS is reviewed within the context of the other available techniques for defect studies. The strengths and weaknesses of PAS as a method for the characterization of defect microstructures are considered. The additional possibilities for using the positron as a localized probe of the atomic and electronic structures of atomic defects are discussed, based upon theoretical calculations of the annihilation characteristics of defect-trapped positrons and experimental observations. Finally, the present status and future potential of PAS as a tool for the study of defects in metals is considered. 71 references, 9 figures.

21050 (CONF-820434—15) **Prevacancy effects in metals observed by positron annihilation.** Smedskjaer, L.C. (Argonne National Lab., IL (USA)). Mar 1982. Contract W-31-109-ENG-38. 4p. NTIS, PC A02/MF A01. Order Number DE83007819.

From 6. international conference on positron annihilation; Arlington, TX, USA (3 Apr 1982).

The prevacancy effects sometimes observed in high-purity, well-annealed metals, are discussed. It is concluded that these effects are extrinsic and are most likely due to positron trapping in defects. The nature of the defects is discussed, and it is pointed out that the presence of dislocations in the samples could cause prevacancy effects.

21051 (CONF-820434—16) **Positron-annihilation spectroscopy of defects in metals: an assessment.** Siegel, R.W. (Argonne National Lab., IL (USA)). Jun 1982. Contract W-31-109-ENG-38. 19p. NTIS, PC A02/MF A01. Order Number DE83007717.

From 6. international conference on positron annihilation; Arlington, TX, USA (3 Apr 1982).

Positron annihilation spectroscopy (PAS) has made significant contributions to our knowledge regarding lattice defects in metals in two areas: (i) the determination of atomic defect properties, particularly those of monovacancies, and (ii) the monitoring and characterization of vacancy-like microstructure development during post-irradiation of post-quench annealing. The application of PAS to the study of defects in metals is selectively reviewed and critically assessed within the context of other available techniques for such investigations. Possibilities for using the positron as a localized probe of the structure of atomic defects are discussed. Finally, the present status and future potential of PAS as a tool for the study of defects in metals are considered relative to other available techniques. 92 references, 20 figures.

21052 (CONF-820659—7) **Superconductivity in artificial Nb/Cu heterostructures.** Falco, C.M.; Schuller, I.K. (Argonne National Lab., IL (USA); Arizona Univ., Tucson (USA)). 1982. Contract W-31-109-ENG-38. 9p. NTIS, PC A02/MF A01. Order Number DE83007747.

From 4. conference on superconductivity in d- and f-band metals; Karlsruhe, F.R. Germany (28 Jun 1982).

Transport and tunneling measurements of artivicially prepared Nb/Cu heterostructures have been made. Samples studied had individual layers in the range 3.6 to 5000 A with total thickness ~ 1 μm. The dependence of T/sub c/ above 300 A layer thickness agrees well with proximity effect theory with no adjustable parameters. Below 300 A the data indicate the T/sub c/ of Nb decreases with layer thickness. The coupling strength 2Δ/kT/sub c/ exhibits a continuous decrease from the strong coupled value of ~ 3.8 (thick layers) toward the weak coupled value of ~ 3.5 (thin layers). No evidence is found for a change in the Nb LA and TA phonons energies from their bulk values down to ~ 10 A. These results, in conjunction with Brillouin scattering measurements of zone center phonons, imply large changes in the phonon dispersion relation as a function of layer thickness in these materials.

21053 (CONF-820662—5) **Deformation and fracture characteristics of spent Zircaloy fuel cladding.** Chung, H.M.; Yaggee, F.L. (Argonne National Lab., IL (USA)). Sep 1982. Contract W-31-109-ENG-38. 35p. NTIS, PC A03/MF A01. Order Number DE83007936.

From 6. international conference on zirconium in the nuclear industry; Vancouver, BC, Canada (28 Jun 1982).

For a better understanding of Zircaloy fuel-rod failure by the pellet-cladding interaction (PCI) phenomenon, a mechanistic study of deformation and fracture behavior of spent power reactor fuel cladding under simulated PCI conditions was conducted. Zircaloy-2 cladding specimens, obtained from fuel assemblies of operating power reactors, were deformed to fracture at 325°C by internal gas pressurization in the absence of fission product simulants. Fracture characteristics and microstructures were examined via SEM, TEM, and HVEM. Numerous dislocation tangles and cell structures, observed in TEM specimens of cladding tubes that failed in a ductile manner, were consistent with SEM observations of a limited number of dimples characteristic of microvoid coalescence. A number of brittle-type failures were produced without the influence of fission product simulants. The brittle cracks occurred near the areas compressed by the Swagelok fittings of the internally pressurized tube and propagated from the outer to the inner surface. Since the outer surface was isolated and maintained under a flowing stream of pure helium, it is unlikely that the brittle-type failure was influenced by any fission product traces. SEM fractography of the brittle-type failure revealed a large area of transgranular pseudocleavage with limited areas of ductile fluting, which were similar in appearance to the surfaces produced by in-reactor PCI-type failures. A TEM evaluation of the cladding in the vicinity of the through-wall crack revealed numerous locations that contained an extensive amount of second-phase precipitate (Zr_3O). We believe that the brittle-type failures of the irradiated spent fuel cladding in the stress rupture experiments are associated with segregation of oxygen, which leads to the formation of the order structure, an immobilization of dislocations, and minimal plastic deformation in the material.

21054 (CONF-820929—10) **Magnetic hyperfine fields in Dy/sub 1-x/Y/sub x/Al_2.** Hessel, A.; Kalvius, G.M.; Shenoy, G.K.; Zinn, W.; Wiedemann, W. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 8p. NTIS, PC A02/MF A01. Order Number DE83007765.

From IUPAP international conference on magnetism; Kyoto, Japan (6 Sep 1982).

^{161}Dy Moessbauer spectroscopy was carried out at 4.2 K on Dy/sub 1-x/Y/sub x/Al_2 for $0 \leqq x \leqq 0.6$. For $x=0$ we find $B=580$ T and f/sub Q/=2810 MHz, close to free-ion values. For x

> 0 both B and f/sub Q/ decrease weakly. We obtain (ΔB)/sub n/ = -14 T, (Δf/sub Q/)/sub n/ = -110 MHz and (ΔB)/sub nn/ = +1.6 T, (Δf/sub Q/)/sub nn/ = +4 MHz per replaced nearest and next-nearest Dy^{3+} neighbor, respectively.

21055 (CONF-821049—13) Void formation and solute segregation in ion-irradiated niobium-base alloys. Loomis, B.A.; Gerber, S.B. (Argonne National Lab., IL (USA)). Oct 1982. Contract W-31-109-ENG-38. 28p. NTIS, PC A03/MF A01. Order Number DE83007682.

From TMS/AIME fall meeting; St. Louis, MO, USA (24 Oct 1982).

The void-volume fraction in unalloyed Nb and Nb-base binary alloys containing either ~ 2.4 a/o Mo, Ti, Zr, Hf, Ni, Fe, V, or Ta has been determined following 3.0-MeV $^{58}Ni^+$ ion irradiation at 1225 K to ~ 50 dpa. also, the thermal- and irradiation-induced segregation of these substitutional-atom solutes and the intrinsic, interstitial-O impurity (~ 0.06 a/o) to the specimen surface and within the irradiation-damaged layer have been determined. The void-volume fraction and the segregation of solutes have been shown to be correlated by the solute diffusivity and the relative chemical affinity of the substitutional solutes for O. The correlated diffusion of vacancy defects and O atoms is postulated to explain the experimental results.

21056 (CONF-821049—14) Effect of helium preinjection and prior thermomechanical treatment on the microstructure of Type 316 SS. Kohyama, A.; Ayrault, G.; Turner, A.P.L.; Igata, N. (Argonne National Lab., IL (USA)). Oct 1982. Contract W-31-109-ENG-38. 20p. NTIS, PC A02/MF A01. Order Number DE83007743.

From TMS/AIME fall meeting; St. Louis, MO, USA (24 Oct 1982).

Samples of 316 SS were preinjected with 15 appM helium either hot (650°C) or cold (room temperature) and irradiated with 3 MeV Ni^+ ions to a dose level of 25 dpa at 625°C in order to test the validity of helium preinjection as a means of simulation of transmutant helium production. Results for preinjected and single-ion irradiated samples were compared to samples irradiated with 3 MeV Ni^+ and simultaneously injected with helium at a rate of 15 appM He/dpa (dual-ion irradiated samples). Preinjected samples exhibited bimodal cavity size distributions. Preinjected samples of solution annealed or solution annealed and aged material showed lower swelling than dual-ion irradiated samples. However, He preinjection in 20% cold worked samples showed greater swelling than dual-ion irradiated samples 9 figures, 1 table.

21057 (CONF-821049—15) Influence of helium-injection schedule and prior thermomechanical treatment on the microstructure of Type 316 SS. Kohyama, A.; Ayrault, G.; Turner, A.P.L. (Argonne National Lab., IL (USA)). Oct 1982. Contract W-31-109-ENG-38. 31p. NTIS, PC A03/MF A01. Order Number DE83007822.

From TMS/AIME fall meeting; St. Louis, MO, USA (24 Oct 1982).

The influence of different helium-injection schedules on microstructure development Ni^+ ion irradiated 316 SS at 625°C is discussed. Injection schedules were chosen to (1) approximate the magnetic fusion reactor condition and (2) mimic the mixed-spectrum reactor condition. Dual-ion irradiation to 25 dpa produced strongly bimodal cavity size distributions in solution-annealed and solution-annealed and aged samples, whereas single-ion irradiation followed by dual-ion irradiation to the same dose produced a cavity size distribution with a substantial component of intermediate-size cavities. Dual-ion irradiation produced only very small cavities in 20% CW material, while single-ion followed by dual-ion irradiation produced some intermediate size cavities and greater swelling. 10 figures.

21058 (CONF-821049—16) Compositional changes in Fe-Cr-Ni alloys under proton bombardment at elevated temperatures. Lam, N.Q. (Argonne National Lab., IL (USA)). Oct 1982. Contract W-31-109-ENG-38. 26p. NTIS, PC A03/MF A01. Order Number DE83007763.

From TMS/AIME fall meeting; St. Louis, MO, USA (24 Oct 1982).

Compositional redistribution in austenitic Fe-Cr-Ni alloys during energetic proton bombardment has been calculated as a function of time, temperature, and ion energy, using a kinetic model of radiation-induced segregation recently developed for ternary alloys. The effect of spatial nonuniformity in damage rates was taken into account and found to have a peculiar effect on the redistribution of the alloying elements. Enrichment of Ni occurs at the bombarded surface and in the bulk beyond the damage range, whereas Fe and Cr are enriched in the peak-damage region at the expense of their depletion in regions near the surface and beyond the damage range. These compositional changes can lead to local phase transformation, since the composition of local regions of the alloy is shifted away from the initial composition into different parts of the multicomponent phase diagram. The stability of the austenite phase in the sub-surface and post-range regions is enhanced by irradiation, while the austenite-to-ferrite transformation takes place in the peak-damage region.

21059 (CONF-821057—2) Magnetic ordering and electronic structure of $CeAl_2$. Jarlborg, T.; Freeman, A.J.; Koelling, D.D. (Geneva Univ. (Switzerland); Northwestern Univ., Evanston, IL (USA). Dept. of Physics; Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 5p. NTIS, PC A02/MF A01. Order Number DE83007827.

From International conference on the impact of polarized neutrons on solid state chemistry and physics; Grenoble, France (15 Oct 1982).

$CeAl_2$ has attracted considerable attention because of its unusual properties including a proposed competition between Kondo and anti=ferromagnetic spin-density wave ordering observed at low temperatures. Here we present results of a self-consistent spin-polarized linear muffin tin orbital band study of $CeAl_2$. In its paramagnetic state the Ce-f band is about 1 eV wide and, although principally above E/sub F/, it accommodates the additional 4f electron when compared to $LaAl_2$ and gives rise to a very high DOS at E/sub F/. The ferromagnetic state is found not to be stable. By contrast, the anti-ferromagnetic state is found to be stable with a magnetic moment of 0.88μ/sub B/ per Ce atom in very good agreement with neutron measurements by Barbara et al. Surprisingly, the anti-ferromagnetic spin-density ordering appears to be related to nesting features in the underlying Fermi surface in $LaAl_2$ (i.e., no 4f electron) rather than that of $CeAl_2$.

21060 (CONF-821174—1) Novel method for the electroless metallization of polyimide: surface oxidation of Zintl anions. Haushalter, R.C.; Krause, L.J. (Argonne National Lab., IL (USA)). Jan 1983. Contract W-31-109-ENG-38. 24p. NTIS, PC A02/MF A01. Order Number DE83007674.

From 1. technical conference polyimides; Ellensville, NY, USA (1 Nov 1982).

The techniques described here are general and should allow the preparation of a large number of novel surface-modified materials. Several methods for the chemical metallization of certain reducible organic polymers, particularly polyimide, are described. These methods depend on the very strong reducing power of the Zintl anions. Main group films can be prepared easily by treating the polymer with a solution of a Zintl anion. The main group deposition was shown to proceed by a substrate reduction/intercalation-deposition mechanism. Transition metal films can be prepared by the reaction of the appropriate metal cation with unmetallized, reduced, intercalated polyimide, K/sub x/ PIm. Finally, unique bimetallic surfaces can be prepared by a combination of these methods using the polymer first as an oxidant, then a reductant. The general reactions types described here also occur with many other substrates besides organic polymers. 11 figures.

21061 (CONF-830418—1) Radiation-induced microstructural changes in Ni-C and Pt-C alloys. Regnier, P.G.; Lam, N.Q. (Argonne National Lab., IL (USA)). Nov 1982. Contract W-31-109-ENG-38. 5p. NTIS, PC A02/MF A01. Order Number DE83007815.

From International conference on dimensional stability and mechanical behavior of irradiated metals and alloys; Brighton, UK (11 Apr 1983).

Microstructural changes in Ni-C and Pt-C alloys under irradiation inside a high-voltage electron microscope were investigated as a function of energy and temperature. Two main aspects of microstructural damage by electron irradiation at energies below the displacement threshold of the host elements are discussed: direct displacement of light C solutes by the incident electrons and indirect displacement of heavy Ni and Pt atoms by secondary C-solvent atom collisions. The present study provides new insights into the mechanisms that lead to the formation of defect aggregates in interstitial alloys during sub-threshold energy irradiation. 5 figures.

21062 (CONF-8006233—) Requirements for heat resistant and highly heat resistant materials in the construction of stationary turbines. Deblon, B. (Kraftwerk Union A.G., Muelheim an der Ruhr (Germany, F.R.)). 1980. 28p. (In German). NTIS, PC A03/MF A01.

From Seminar on heat treatment of heat resistant and highly heat resistant materials; Schloss Dachau, F.R. Germany (12 Jun 1980).

Presented at Status-Sem. on Waermebehandlung warmfester u. hochwarmfester Werkstoffe, Schloss Dachau, West Germany, 12-13 Jun. 1980.

The requirements for the characteristics of construction materials for turbines are discussed as regards design and cost estimates in order to cope with the demand for higher power and efficiency in the field of electric energy production. This demand entails larger dimensions and higher pressure and temperature at the turbine entrance. The material requirements for blades, rotor parts, housing, and components in contact with hot vapor and hot gas are deduced. It is impossible to fulfill all requirements at the same time. Optimization stresses the important material characteristics, bearing in mind that results on small workpieces are not necessarily transferable to larger ones. (ESA)

21063 (CONF-8108102—2) Implications for surface science of Doppler-shift laser-fluorescence spectroscopy. Gruen, D.M.; Krauss, A.R.; Pellin, M.J.; Wright, R.B. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 37p. NTIS, PC A03/MF A01. Order Number DE83007869.

From 5. international summer institute for surface sciences; Milwaukee, WI, USA (23 Aug 1981).

This paper deals with the recent development of laser-induced fluorescence of sputtered atoms. Doppler-shift laser-induced fluorescence spectroscopy (LFS) provides a sensitive, high-resolution method for obtaining both sputtered neutral atom and ion velocity distributions and relative sputtering yields. Certain aspects of charge transfer processes at surfaces are reviewed particularly as they relate to theories of secondary ion emission. It is shown how LFS has been used to determine the number density velocity distributions of neutral Zr atoms sputtered from a Zr metal surface in the a^3F_2 ground state and in two metastable states ($a^3F_{3\ 4}$) which lie 570 and 1241 cm^{-1} above the ground state. Sputtering was by Ar^+ and Kr^+ ions at 1.5 to 3 keV. 50 references, 11 figures, 2 tables. (DLC)

21064 (CONF-8208118—1) Diffusion mechanisms in grain boundaries in metals. Peterson, N.L. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 18p. NTIS, PC A02/MF A01. Order Number DE83007785.

From Diffusion in metals and alloys conference; Tihany, Hungary (29 Aug 1982).

A critical review is given of our current knowledge of models and mechanisms for grain-boundary diffusion in metals. A pipe mechanism of diffusion based on the well-established dislocation model seems most appropriate for small-angle boundaries. Open channels, which have atomic configurations somewhat like dislocation cores, probably play a major role in large-angle grain-boundary diffusion. Dissociated dislocations and stacking faults are not efficient paths for grain-boundary diffusion. The diffusion and computer modeling experiments are consistent with a vacancy mechanism of diffusion by a rather well localized vacancy. The effective width of a boundary for grain-boundary diffusion is about two atomic planes. 56 references, 6 figures.

21065 (CONF-8210116—2) Solution hardening and strain hardening at elevated temperatures. Kocks, U.F. (Argonne National Lab., IL (USA)). Oct 1982. Contract W-31-109-ENG-38. 28p. NTIS, PC A03/MF A01. Order Number DE83007745.

From American Society of Metals meeting; St. Louis, MO, USA (24 Oct 1982).

Solutes can significantly increase the rate of strain hardening; as a consequence, the saturation stress, at which strain hardening tends to cease for a given temperature and strain rate, is increased more than the yield stress: this is the major effect of solutes on strength at elevated temperatures, especially in the regime where dynamic strain-aging occurs. It is shown that local solute mobility can affect both the rate of dynamic recovery and the dislocation/dislocation interaction strength. The latter effect leads to multiplicative solution strengthening. It is explained by a new model based on repeated dislocation unlocking, in a high-temperature limit, which also rationalizes the stress dependence of static and dynamic strain-aging, and may help explain the plateau of the yield stress at elevated temperatures. 15 figures.

21066 (DOE/ER/10429—4) Atomistic studies of grain boundaries with segregated impurities. Progress report, Jul 1, 1982-Jun 30, 1983. Vitek, V. (Pennsylvania Univ., Philadelphia (USA). Dept. of Materials Science and Engineering). Feb 1983. Contract AC02-79ER10429. 19p. NTIS, PC A02/MF A01. Order Number DE83007982.

An extensive multiplicity of grain-boundary structures occurs in general boundaries. Transformations between different structures occur through absorption or emission of vacancies. As the concentration of the solutes in the boundary increases two-dimensional ordered structures are formed whose crystallography is governed by the structure of the originally pure boundary and the solute-solute interaction. In the case of an alloy where ordering is unfavorable, these structures correspond to the maximum concentration which can be achieved by exchange of solvent and solute atoms. However, if ordering is favored, these ordered structures may extend further into the lattice on each side of the boundary. Significant changes occur in the boundary structure during segregation. The relative displacement of the grains changes. Transformations into other possible multiple structures are often induced and new structures may be stabilized. This implies that the extensive multiplicity of structures may be reduced which may lead to significant decrease in the ability of boundaries to absorb or emit vacancies. Similarly, diffusivity may be reduced. This would be reflected in the effects of segregation on the high-temperature behavior of materials. Transformations occurring in the boundaries lead to their migration if they correspond to transitions between different multiple structures. Thus migration induced by a flux of impurities could occur, analogously to the diffusion-induced grain-boundary migration.

21067 (DOE/ER/10433—T1) Microstructural approach to fatigue-crack processes in polycrystalline bcc materials. Annual technical progress report IV. Gerberich, W.W. (Minnesota Univ., Minneapolis (USA). Dept. of Chemical Engineering and Materials Science). 1 Mar 1983. Contract AC02-79ER10433. 21p. NTIS, PC A02/MF A01. Order Number DE83007912.

The following were studied: strain-rate sensitivity of Ti-30 Mo after cyclic stabilization, cyclic stress-strain of Ti-30 Mo, plastic strain distributions in Fe-4% Si single crystal cleavage, fatugue closure and thresholds in Fe binary alloys, and fatigue crack thresholds in HSLA steel. 8 figures. (DLC)

21068 (DOE/ER/10570—T1) Mechanisms of damage accumulation in time-dependent cyclic deformation. Progress report, January 1, 1982-December 31, 1982. Laird, C. (Pennsylvania Univ., Philadelphia (USA). Dept. of Materials Science and Engineering). Aug 1982. Contract AC02-80ER10570. 7p. NTIS, PC A02/MF A01. Order Number DE83000993.

Two kinds of damage produced in cyclic creep were studied: (1) change in the dislocation density and arrangement, to be studied in copper and (2) damage phenomena perhaps involving precipitates in Cr-Mo-V rotor steel. In copper tested at low temperatures, strain bursts were recognized for the first time in polycrystals of a pure metal in both cyclic and static creep. Cyclic stress-strain response in cyclic creep was defined, and a study of single crystals carried out in order to study better the dislocation structures associated with bursts. Because of its superior quality, a Westinghouse rotor steel was eventually chosen for detailed study. Effort was directed this year on the high temperature testing apparatus. High temperature tests have been extended to lower amplitudes.

21069 **(DOE/NBM—3008210) Description of the method of producing coatings of Raney nickel catalyst by flame-spraying and findings obtained by examining samples of the coatings.** (Department of Energy, Pittsburgh, PA (USA). Pittsburgh Energy Research Center). [nd]. 12p. NTIS, PC A02/MF A01. Order Number DE83008210.

Raney Nickel, a commercially available powdered nickel-aluminum catalyst, has been flame-sprayed onto various stainless steel shapes used in methanation reactors for the purpose of developing a process to make synthetic natural gas (methane, CH_4) from 3:1 synthesis gas ($3H_2 + 1CO$) produced in a coal gasifier. The flame spray equipment used is commercially available and the spray parameters selected are essentially conventional, but some equipment modifications and variations in spray techniques have been made to produce acceptable coated reactor surfaces. Examination of the coatings shows that a multi-phase structure of Ni_2Al_3, $NiAl_3$ and a eutectic of Ni_2Al_3 and α-aluminum is deposited.

21070 **(EPRI-CS—2858) Electrochemical measurement of corrosion rates in cathodically protected systems. Final report.** McKubre, M.C.H. (SRI International, Menlo Park, CA (USA)). Feb 1983. 60p. NTIS, PC A04/MF A01. Order Number DE83901467.

Objective was to evaluate the use of harmonic analysis as a nondestructive, in-situ method of measuring corrosion rates of cathodically protected components in the tube/tube sheet/water box region of steam surface condensers. A frequency response analyzer was used to measure the fundamental and harmonic current response to a sinusoidal voltage perturbation imposed on cylindrical specimens of CuNi alloys and titanium, in aerated synthetic ocean water. The results were analyzed using a mathematical procedure and computer program developed in this study. Calculated corrosion rates were compared with direct mass loss measurements and good agreement was obtained. However, due to very small corrosion rates under cathodic protection, direct mass loss determinations include very large uncertainties. The corrosion rates computed from the harmonic analysis vary in the expected way with convection and cathodic protection potential.

21071 (INIS-mf—7432, pp vp) **Effect of the sample preparation technique on gamma-ray asymmetry of Tb isotopes in a gadolinium matrix.** Dupak, J. From 6. conference of Czechoslovak physicists; Ostrava, Czechoslovakia (27 Aug 1979).

21072 **(LA-UR—82-2428) Deformation of microstructures due to low-velocity particulate erosion of ductile metals by spherical particles.** Follansbee, P.S.; Banerjee, D.; Williams, J.C. (Los Alamos National Lab., NM (USA)). 1983. Contract W-7405-ENG-36. 29p. (CONF-830402—1). NTIS, PC A03/MF A01. Order Number DE82021890.

From International conference on weat of materials - mechanisms and control of wear; Washington, DC, USA (11 Apr 1983).

A simple cumulative damage model has been developed for the low-velocity, normal-incidence, erosion of ductile metals by spherical particles. The model correlates the computed plastic-strain distribution for different impact velocities and materials with the experimentally measured erosion rates. This paper describes the surface and sub-surface changes which occur in Cu and Cu-6 wt % Al specimens during erosion testing. Scanning and transmission electron microscopy have been used to study these changes in order to determine whether the deformed microstructures are consistent with the predictions of the model. Because the deformation due to the impact of a 50°m-diameter spherical particle occurs at high strain rates (10^6 s^{-1}) and is also highly localized, the deformation mechanisms differ slightly from bulk deformation which has been reported for low strain rates. The contribution of strain localization (adiabatic shear) and twinning is discussed in light of the microstructural observations. 7 figures.

21073 **(LBL—14535) Microstructures, transformations and properties of oxidation-resistant, iron-base, aluminum-modified alloys.** Tamayo, G.L. (Lawrence Berkeley Lab., CA (USA)). Dec 1982. Contract AC03-76SF00098. 64p. NTIS, PC A04/MF A01. Order Number DE83007064.

Effects of different cooling rates on the microstructure and properties of an Fe-8Al-6Mo-0.25Nb-0.8Zr-0.1Ce-0.1C alloy, initially heat treated at 900°C for one hour, were investigated. Electron diffraction and microscopy revealed in air-cooled specimens a uniform distribution of second phase particles of ~ 3000°A consisting principally of Fe, Mo, and Nb. Evidence of DO_3 ordered particles was also found at this cooling rate. Oil-quenched and water-quenched specimens presented a more distorted matrix with a smaller gain size but the presence of second phase particles was not evident. Mechanical strength and hardness were higher and ductility lower for the slowly cooled specimens. However, oxidation resistance at 1000°C in air showed only slight variation with cooling rate, and compared favorably with two austenitic stainless steels subjected to the same treatment. It is concluded that the substitution of Al for Cr and Ni in Fe-base alloys can be made with little or no loss of favorable microstructures and properties characteristic of stainless steels. 23 figures.

21074 **(LBL—14911) Microstructural influence on abrasive wear resistance of high-strength, high-toughness medium-carbon steels.** Kwok, C.K.; Thomas, G. (Lawrence Berkeley Lab., CA (USA)). Sep 1982. Contract AC03-76SF00098. 30p. (CONF-830402—2). NTIS, PC A03/MF A01. Order Number DE83002571.

From International conference on weat of materials - mechanisms and control of wear; Washington, DC, USA (11 Apr 1983).

A systematic study of abrasive wear resistance of Fe/Cr/Mn experimental steels has been carried out in two-body pin-on-disc abrasion tests. Silicon carbide, alumina, and quartz were used as abrasives. The relationships between microstructures, mechanical properties, and abrasive wear resistance for these experimental steels were studied. In addition, several commercial alloys were tested to provide a basis for comparison. Results show that dislocated lath raartensite with continuous interlath film of retained austenite appears to be a desirable microstructure for good wear resistance. Grain refinement by double heat treatment was found to improve the toughness in the experimental steels but have little effect on the abrasive wear resistance. In general, superior tensile properties and wear resistance, without sacrifice in toughness, can be achieved by a lath martensitic microstructure. 8 figures.

21075 **(LBL—15489) Damage and in-situ annealing during ion implantation.** Sadana, D.K.; Washburn, J.; Byrne, P.F.; Cheung, N.W. (California Univ., Berkeley (USA)). Nov 1982. Contract AC03-76SF00098. 15p. (CONF-821107—51). NTIS, PC A02/MF A01. Order Number DE83008394.

From 6. international symposium on the scientific basis for radioactive waste management; Boston, MA, USA (1 Nov 1982).

Formation of amorphous (α) layers in Si during ion implantation in the energy range 100 keV-11 MeV and temperature range liquid nitrogen (LN)-100°C has been investigated. Cross-sectional transmission electron microscopy (XTEM) shows that buried amorphous layers can be created for both room temperature (RT) and LN temperature implants, with a wider 100 percent amorphous region for the LN cooled case. The relative narrowing of the α layer during RT implantation is attributed to in-situ annealing. Implantation to the same fluence at temperatures above 100°C does not produce α layers. To further investigate in situ annealing effects, specimens already containing buried α layers were further irradiated with ion beams in the temperature range RT-400°C. It was found that isolated small α zones ($\leqq$ 50 diameter) embedded in the crystalline matrix near the two α/c interfaces dissolved into the crystal but the thickness of the 100 percent α layer was not appreciably affected by further implantation at 200°C. A model for in situ annealing during implantation is presented.

21076 (LBL-PUB—304-8-82) Erosion/corrosion newsletter (excerpted from LBL—13840). Levy, A.V. (Lawrence Berkeley Lab., CA (USA)). Aug 1982. Contract AC03-76SF00098. 16p. NTIS, PC A02/MF A01. Order Number DE83003647.

Research is reported on the following programs: erosion/corrosion wear, coal liquefaction alloy test, utilization of metals in oil shale retort components, and materials characterization in fossil fuel combustion products. (DLC)

21077 (MLM—3041) Nonliquid surface preparation for electrodeposition. Nesslage, G.V.; Schurman, W.R. (Monsanto Research Corp., Miamisburg, OH (USA). Mound). 10 Mar 1983. Contract AC04-76DP00053. 6p. NTIS, PC A02/MF A01. Order Number DE83008213.

A nonliquid method was developed to surface treat nonconductive material prior to electroplating. A comparison of this method with the conventional liquid method shows that the conventional method is a 21-step wet chemistry method, whereas the nonliquid method requires only seven steps to prepare a sensitized surface, and it can be performed by the deposition of material from the gaseous phase. The work accomplished to date, demonstrating the feasibility of the method, is presented.

21078 (N—82-14291) Effects of a large temperature gradient on the structure of directionally solidified eutectic composites and superalloys. Staniek, G. (Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt e.V., Koeln (Germany, F.R.)). 1980. 3p. (In German). NTIS, PC A03/MF A01.

In its Colloq. on Composite Mater. 3 p (SEE N82-14289 05-24) REFS.

An apparatus for high temperature tests of the structural stability of directionally solidified eutectic composites and superalloys was developed. It was used for cooled blades in high temperature gas turbines in which fast temperature changes and important temperature gradients occur. With this apparatus, a temperature gradient of a few hundred K/mm is obtained with a maximum of 1600 K. Structural instabilities due to mechanical stresses (cracks and plastic deformation) occur especially in superalloys, although some are decidedly stable. Instabilities due to thermal loads (coarsening, transformations, decomposition of phases, oxidation) are frequently observed, but test temperatures and gradients are considerably higher than in normal operation, so the employment of these alloys is not directly limited. (ESA)

21079 (N—8230252) Review of corrosion causes and corrosion control in a technical facility. Charng, T.; Lansing, F. (Jet Propulsion Lab., Pasadena, CA (USA)). Jun 1982. 12p. NTIS, PC A10/MF A01.

Causes of corrosion of metals and their alloys are reviewed. The corrosion mechanism is explained by electrochemical reaction theory. The causes and methods of controlling of both physiochemical corrosion and biological corrosion are presented. Factors which influence the rate of corrosion are also discussed.

21080 (NASA-CASE-LEW—13450-1) Covering solid, film cooled surfaces with a duplex thermal barrier coating. Liebert, C.H. (National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center). Dec 1981. 9p. NTIS, PC A02/MF A01.

A thermal barrier coating is applied to solid film cooled hardware. Also, thermal barrier coating systems are used to provide corrosion resistance and thermal protection to these base metal surfaces. An inert gas, such as argon, is discharged through the apertures during the application of the thermal barrier coating system by plasma spraying. This flow of inert gas reduces both blocking of the holes and base metal oxidation during the coating operation.

21081 (NASA-CR—165395) Development of improved high temperature coatings for In-792 + Hf. Final report. Profant, D.D.; Naik, S.K. (Avco/Lycoming, Stratford, CT (USA)). Jun 1981. 95p. NTIS, PC A05/MF A01.

The development for t-55 1712 engine of high temperature for integral turbine nozzles with improved thermal fatigue resistance without sacrificing oxidation/corrosion protection is discussed. The program evaluated to coating systems which comprised one baseline plasma spray coating (12% Al-NiCoCrALY), three aluminide coatings including the baseline aluminide (701), two CoNiCrAly (6% Al) + aluminide systems and four NiCoCrY + aluminide coating were evaluated. The two-step coating processes were investigated since it offered the advantage of tailoring the composition as well as properly coating surfaces of an integral or segmented nozzle. Cyclic burner rig thermal fatigue and oxidation/corrosion tests were used to evaluate the candidate coating systems. The plasma sprayed 12% Al-NiCoCrAlY was rated the best coating in thermal fatigue resistance and outperformed all coatings by a factor between 1.4 to 2.5 in cycles to crack initiation. However, this coatings is not applicable to integral or segmented nozzles due to the line of sight limitation of the plasma spray process. The 6% Al-CoNiCrAlY + Mod. 701 aluminide (32 w/o Al) was rated the best coating in oxidation/corrosion resistance and was rated the second best in thermal fatigue resistance.

21082 (PB—82-203324) Corrosion behaviour of engineering materials at elevated temperatures in an oxidising environment containing sulphur derivatives: influence of the composition of aggressive media and of the alloys under test (tenue a la corrosion a temperature elevee de materiaux par les milieux oxydants contenant des derives soufres: influence de la composition des phases agressives et des alliages exprimentes). Final report. Vincent, L.M.; Cappelaere, M.; Dominget, R.; Rurcot, G. (Commission of the European Communities, Luxembourg). [nd]. 67p. NTIS, PC AE04/MF E04.

In a study aiming at a deeper understanding of the mechanism of corrosion, the behaviour of several alloys and metals was examined at three different temperatures (773K, 873K and 1073K), viz, Alloy 600, Alloy 800, Uranus S, an iron-chromium-aluminium alloy and a ferrous alloy with 40% aluminium, as well as the metals iron, chromium, nickel, molybdenum and titanium.

21083 (PNL-SA—9287) Strength changes in vanadium and titanium irradiated with 14-MeV neutrons. Bradley, E.R.; Jones, R.H. (Pacific Northwest Lab., Richland, WA (USA)). 1981. Contract AC06-76RL01830. 4p. (CONF-810831—90). NTIS, PC A02/MF A01. Order Number DE82012860.

From Fusion reactor materials meeting; Seattle, WA, USA (9 Aug 1981).

The flow properties and microstructures of vanadium and titanium have been studied following irradiation at 300°K with T(d,n) neutrons. The threshold fluence for observable hardening was about 1 x 10^{21} m^{-2} for both materials while at 8 x 10^{21} m^{-2} the yield strength in the vanadium was about 1.5 times higher than for the titanium. Neither material showed the low fluence hardening plateau that is commonly observed in bcc metals and attributed to interstitial impurity atoms. Small defect clusters were found in the vanadium irradiated to 8 x 10^{21} m^{-2} while this fluence level appeared to be the threshold for observable defect clusters in titanium.

21084 (RFP—3329) PVD by electron-beam processes. Mah, G. (Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant). 1982. Contract AC04-76DP03533. 6p. (CONF-820611—3). NTIS, PC A02/MF A01. Order Number DE83006740.

From American Electroplaters Society (SUR/FIN) conference; San Francisco, CA, USA (20 Jun 1982).

Physical vapor deposition by electron beam evaporation has been used to produce coatings and resistive elements. A new technique in electron beam evaporation is hot hollow cathode evaporation. Some of the differences between electron beam evaporation and sputtering are listed, as are the process parameters and coating properties which must be correlated. Properties of Be films are correlated with substrate temperature. Hot hollow cathode evaporation of Ag is used to illustrate the effects of substrate bias voltage on coating properties. Finally, some of the applications of electron beam evaporation and the materials used are tabulated. (DLC)

21085 (RFP—3486) Galvanic corrosion of metals and coatings when coupled to uranium in severe environments. Winkle, J.R.; Childs, E.L. (Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant). 17 Aug 1982. Contract AC04-76DP03533. 43p. NTIS, PC A03/MF A01. Order Number DE83007537.

The results of galvanic testing were varied in each environment. The position of metals in the galvanic series was not fixed, but changed with environment. In all cases where high general and galvanic corrosion rates were observed, the conditions of potential, pH, and impurity content could be correlated with regions of oxide surface film instability outlined by Pourbaix Diagrams. The majority of the severe corrosion reactions were observed in the acidic environment, although a few were noted in the caustic environment. The presence of chlorides tended to enhance galvanic corrosion rates at the neutral environment. 10 tables.

21086 (RSRE-MEMO—3360) Anomalous reflectivity losses of coated mirrors used in the infrared. Ball, G.J. (Royal Signals and Radar Establishment, Malvern (UK)). Jan 1982. 22p. Royal Signals and Radar Establishment, Malvern, England.

REFS.

Reflectivity losses of aluminum mirrors at nonnormal angles of incidence (theta) are shown to occur where theta the negative square root of (the complex refractive index squared + the extinction coefficient squared). Thin layers of Y_2O_3 and of HfO_2 show losses for wavelengths 12 micron. Carbon coating is abrasion resistant, chemically durable, and optically very efficient over a wide range of theta. Maximum reflectivity decreases by 0.7% between theta zero and 60 deg.

21087 (T—15/80) Corrosion and high temperature resistant coatings for molybdenum, made out of iron and nickel alloys and applied by explosive welding. Pruemmer, R.; Henne, R. (Fraunhofer-Gesellschaft zur Foerderung der Angewandten Forschung e.V., Freiburg im Breisgau (Germany, F.R.). Inst. fuer Werkstoffmechanik). Apr 1980. 18p. (In German). NTIS, PC A02/MF A01.

The impact parameters of the explosive welding of molybdenum with Inconel 601 were determined. The combination Mo and Inconel 601 was considered as nonweldable. It can be applied in solar radiation concentrating devices, allowing a higher operating temperature and higher energy conversion efficiency. The usual velocities of the explosive welding process (collision velocities of 2200 m/sec) lead at best to samples affected by cracks, due to the insufficient workability of molybdenum. At higher velocities cracks no longer occur, molybdenum being a strain rate sensitive material. Layer composite materials can be manufactured in flat as well as in tube form. (ESA)

21088 (UCB/RP—82/D1009) New class of steels for thick-wall pressure vessels. Final technical report, June 21, 1980-June 30, 1982. Spencer, P.N.; McGee, A.C.; Parker, E.R. (California Univ., Berkeley (USA). Dept. of Materials Science and Mineral Engineering). 1982. Contract W-7405-ENG-26. 91p. NTIS, PC A05/MF A01. Order Number DE83004101.

Objective is to develop a new class of steels that can be field fabricated into very-large-diameter, very-thick-wall, pressure vessels for coal gasification/liquefaction systems, and specifically to develop an Fe-C-V-Ni based alloy which, after a simple continuous cooling process (instead of quenching and tempering), would exhibit through-thickness strength and toughness combinations comparable to those of commercially available pressure-vessel steels and which at the same time would be less susceptible to hydrogen attack. Previous work included detailed studies of isothermally transformed Fe-C-V base alloys and preliminary investigations of continuously cooled steels. Results indicated that uniform microstructures with combinations of strength and toughness could be produced in a wide range of section thicknesses. From June 1980 through June 1981, emphasis was placed on investigating the effect on mechanical properties/microstructure relationships of different austenitization temperatures and different rates of continuous cooling of six Fe-C-V-Ni-Mn alloys. During the June 1981 to June 1982 period, an additional three Fe-C-V compositions including additions of Al, Si, or Mo were added to the list of alloys being investigated. In addition to evaluation of continuous cooling characteristics and VC dissolution and coarsening kinetics, emphasis was placed on hydrogen attack and weldability studies.

21089 (UCID—19687) Determination of static friction of beryllium to beryllium and beryllium to 1040 steel. Morrison, R.L. (Lawrence Livermore National Lab., CA (USA)). Feb 1983. Contract W-7405-ENG-48. 10p. NTIS, PC A02/MF A01. Order Number DE83007307.

The coefficients of static friction of beryllium to beryllium and beryllium to 1040 steel were determined in normal atmosphere and in dry argon atmosphere. Both the incline plane and hoizontal opposing force methods were used. The agreement between the two methods, as well as the precision within each method, appears to be good. The results obtained in a dry argon atmosphere are still suspiciously low even after very careful and repeated experiments. 3 tables.

21090 (UCRL—52000-82-12, pp 10-17) **Measuring equations of state with the electric gun.** Dec 1982. NTIS, PC A02/MF A01.

In Energy and Technology Review.

We have used the electric gun to accelerate tantalum foils to velocities high enough to produce shock pressures near 1 TPa. The results confirm that the electric gun is a promising tool for studying the EOS of materials at ultrahigh pressures.

21091 (Y/DV—265) Thermal profiles from electron-beam welds on uranium-6 niobium alloy. Mustaleski, T.M.; Stanaland, V.A.; Chapman, L.R. (Oak Ridge Y-12 Plant, TN (USA)). 19 Jan 1983. Contract W-7405-ENG-26. 13p. (CONF-8210124—1). NTIS, PC A02/MF A01. Order Number DE83007283.

From DOE/ALO interagency mechanical operations group meeting; Las Vegas, NV, USA (19 Oct 1982).

Little information exists on the properties of the fusion and heat-affected Zones (HAZ) in U-6Nb alloy. This paper reviews the early steps of a program to gather such information. Several preliminary tests were made to determine welding parameters which would give full penetration on the 0.125-in. thick plate. The time-temperature histories experienced by the weld HAZ were compared to those generated by the computer code TEMP. 6 figures. (DLC)

21092 Positional reference system for ultraprecision machining. Arnold, J.B.; Burleson, R.R.; Pardue, R.M. (to Dept. of Energy). US Patent 4,365,301. 21 Dec 1982. Filed date 12 Sep 1980. vp.

PAT-APPL-186869.

A stable positional reference system for use in improving the cutting tool-to-part contour position in numerical controlledmultiaxis metal turning machines is provided. The reference system employs a plurality of interferometers referenced to orthogonally disposed metering bars which are substantially isolated from machine strain induced position errors for monitoring the part and tool positions relative to the metering bars. A microprocessor-based control system is employed in conjunction with the plurality of position interferometers and part contour description data inputs to calculate error components for each axis of movement and output them to corresponding axis drives with appropriate scaling and error compensation. Real-time position control, operating in combination with the reference system, makes possible the positioning of the cutting points of a tool along a part locus with a substantially greater degree of accuracy than has been attained previously in the art by referencing and then monitoring only the tool motion relative to a reference position located on the machine base.

21093 Method for producing microporous metal bodies. Danko, J.C. (to Dept. of Energy). US Patent 4,362,564. 7 Dec 1982. Filed date 12 Sep 1967. vp.

PAT-APPL-668744.

Tungsten is vapor-deposited by hydrogen reduction of tungsten hexafluoride (Wf_6) to produce a tungsten body having from 40 to 100 ppm fluorine. The tungsten is then heated under vacuum produce grain boundary porosity for a sufficient period of time to allow the pores along the grain boundaries to become interconnected.

21094 Method of producing microporous joints in metal bodies. Danko, J.C. (to Dept. of Energy). US Patent 4,362,582. 7 Dec 1982. Filed date 12 Sep 1967. vp.

PAT-APPL-668743.
